Mining and Scientific Press.

A JOURNAL OF SCIENCE, ART, MINING, AGRICULTURE, MANUFACTURES, CHEMISTRY, INVENTIONS, ETC.

VOL. III.

SAN FRANCISCO, SATURDAY, MARCH 30, 1861.

NO. 1

ST. GEORGE HOTEL, SACRAMENTO,

J. R. HARDENDERGH & J. B. DAYTON, PROPRIETORS.

We illustrate herewith one of the largest and most beautiful structures ever erected in this State. This immense hotel is situated on the corner of Fourth and J streets, Sacramento, occupying an area of one hundred and sixty feet on street, by sixty feet on J street; four stories high, containing one hundred and seventy-four neatly furnished apartments,—parlors, billiard, dining, sitting and bathing rooms,—arranged upon the most modern and approved method. These premises were originally designed and put in of erection by Mr. Dawson, in 1856. The style, and the architectural embellishments, together with its location and site, certainly places this public resort far above other public houses. During the session of the Legislature, an immense concourse from all parts of this State gathered to this place of abode, it being the most fashionable and comfortable hotel in Sacramento. It is by far the largest and most extensive building in this State, and bears a favorable comparison with any of the best class hotels in the Atlantic cities.

This hotel is now occupied by our esteemed friends, Messrs. J. R. Hardenbergh and J. B. Dayton, who are favorably known on this Pacific Coast. Mr. J. R. Hardenbergh has been one of the early settlers of California, more especially Sacramento. In 1852-3 he presided as mayor of that city. We well remember when he went with will and determination to bring back the members of the Legislature from an isolated spot, Vallejo, then the seat of government, to Sacramento, where the capital has been retained ever since. The city of Sacramento must ever be thankful for this to Mr. Hardenbergh. But Mr. Hardenbergh has also gained for himself the reputation of a kind, liberal

and benevolent citizen, while proprietor of the celebrated Orleans Hotel. There are upwards of thirty employees in constant attendance. The main entrance is on Fourth street, the house being kept open all night for the purpose of accommodating its numerous patrons, on the arrival of inland stages, as well as those coming by steamers from the Bay. The apartments are provided with every convenience imaginable, and as incident to any first class house. The dining room is capable of accommodating three hundred persons, with complete comfort and convenience, by polite servants and attendants. We thank the polite and gentlemanly proprietors for their kindness and attention paid us while staying at this favorite house, and hereby wish them a long and continued success, which they so richly deserve.

The first number of a newspaper printed at Silver City makes its appearance to-day, William Card, editor. We wish it the most complete success, and that that Card may prove a *trump*, as the printing business is, financially speaking, powerful *trick-y*, unless a proper lead is made.—*Silver Age*.

[The above laconic notice of the Washoe Times deserves room in the Press. Locke is a printer of old standing in this city. He is deserving of patronage. We hope he will give us reliable data of the rich silver tracts, and send us in exchange thereof, in lieu of the Press.—Editor Press.]

The Ophir Company have erected at Washoe Valley machinery for sawing lumber and crushing quartz, which cost \$75,000. A forty-horse power engine is used. The company employ ninety-five hands, and have inclosed their works by a high picket fence.

New Process.

The following process is one of marked practicability with reference to silver ore. It was originally proposed by Dr. Percy of London, and has been recently extensively carried out by Von Patera, at Vienna:

The ores which contain the silver, in combination with sulphur, or with sulphur and arsenic, are first roasted with copperas and common salt, and by this means a chlorid of silver is produced, which may be dissolved out with a solution of hyposulphite. The silver is then precipitated by sulphide of sodium, and falls down as sulphide of silver. All that is necessary to be done then is to heat the sulphide in a muffle exposed to the air, when the sulphur escapes in the form of sulphurous acid and the silver remains in the metallic state; it is then melted in plumbago crucibles, and cast into ingots, ready for minting. The ores which have been subjected to this process, as stated in the Society of Arts Journal, contain from two to ten per cent of silver; the hyposulphite is used weak and cold; its dissolving power is great. This solution may be used over and again, and it is continually renewed, and this is a peculiarity in the process. The precipitation of the silver from the hyposulphite is by the sulphite, or, rather, a polysulphide, which is prepared by calcining soda with sulphur, then boiling it with sulphur. In this manner, a polysulphide of sodium is formed, which, when it is brought into contact with the atmosphere, some hyposulphite is generated, so that, when it is used to precipitate the silver, it also renews the bath of hyposulphite, and may be used repeatedly for the same purpose. By this process Herr Von Patera extracts 3000 pounds of silver per annum from the ores of Joachimsthal, in Bohemia. The expense of extracting a pound of silver from the ore by this method is two dollars and seven cents. By the old method of smelting, it cost three dollars and fifty-two cents.

WASHOE ORE.—Seven thousand six hundred and thirteen pounds of Washoe ore has been received by Mr. Perkins, since our last issue, and shipped below. There will be large quantities of this rock shipped to San Francisco this season. Mr. Perkins is receiving large lots of machinery, in the shape of engines, boilers, stamps, amalgamators, etc., which he is forwarding at a rapid rate to the Washoe district.—*Folsom Telegraph*.

[Continued.]

Prop. 1. *Miner's Inaugural Address Before the Legislature.*

2. *Physical Geography.*—No geological report of a State like California can be considered as complete unless accompanied by a full investigation of its physical geography, especially as connected with the agricultural development of the State. Under the term "physical geography," I include everything connected with the configuration of the surface, the elevation, direction and distribution of its mountain ranges, its drainage—including all the phenomena of its springs, lakes and rivers; the peculiar composition of its waters; the relation of the land to the ocean; and, furthermore, the climatology of the State; the conditions regulating the distribution of heat and cold, moisture and dryness, winds and storms, and all those circumstances by which the agricultural character of a region is determined; these are all to be ascertained by long-continued and careful observations of the necessary instruments at numerous stations. This must be effected in conjunction with what has already been done by the United States Government at the various military posts, as well as by the Smithsonian Institution. There is a large amount of disjointed material scattered through various official publications, which should be collected and the general result brought together, and made available for the people of the State.

3. *Agricultural Resources and Botany.*—Next in order comes the development of the agriculture and botany of the State.

We propose to furnish as complete a catalogue as possible of all the plants growing in California, together with such observations on their economical value and application to the daily wants of life as may be collected during the progress of the survey. Such species as prove to be new will be described and figured with care. The geographical distribution of the forest trees; the size and abundance of the different kinds suited for building purposes; the possibility of introducing and disseminating new varieties, or of increasing the number of those which are native to the State. These are topics of importance, which deserve thorough study. The character and composition of the soil, its adaptation to various crops, the best methods of irrigation, sources of fertilizers, means of amendment, drainage—all these subjects will come up for investigation in the course of the survey.

Professor Brewer, who has this department in charge, has had the advantage of the instruction of the most eminent agricultural chemists in Europe, including Liebig and Boussingault, who have just been placed at the head of the New York State Agricultural College at the time the survey was organized. He was recommended by competent authority as being better fitted than any one else to take the direction of this branch of the survey, and it is a matter of congratulation that we have been able to secure his services.

4. *Zoology.*—The bill organizing the geological survey contemplates, in its fourth place, "a full and scientific description of its zoological productions." In carrying out this branch of the survey, we have, in the first place, to make a complete collection of all the animals which are found within the borders of the State, from the lowest in rank up to the most highly organized; from the humblest polyp to the most perfect vertebrate. These collections must be referred to competent authorities in the various departments of natural history, for investigation and arrangement. The new species must be described and figured, and the information collected which in any way bears on the economical interests of the State. A large amount of work in this department has already been accomplished by the Smithsonian Institution, and the co-operation of the able naturalists attached to that great national establishment may be secured, no doubt, for our further investigations.

5. *General Geology and Paleontology.*—The strictly geological portion of our great work may be properly divided into two sections: The first includes the general geology and paleontology; the second, the economical or applied geology. Under the first division we include all that relates to the general geological structure of the State, while the second embraces the practical application of the science to the wants and uses of the arts. Under the head of general geology we have to investigate the nature of the different rock formations which are spread out in the valleys and up to the immense mountain masses which traverse the State. We endeavor to ascertain of what materials they are composed; how originally formed or deposited; what changes they have undergone since their deposition, and by what agencies these changes have been brought about. We seek to learn and describe the fossil remains which the stratified rocks contain, and thus are enabled to compare them with the formations of other countries, and to fix their relative geological age and position. We then trace over the surface of the State, and lay down upon the map the range and extent, or the geographical distribution of the different systems and groups of rocks, and exhibit their stratigraphical relations or positions with regard to each other by means of sections showing the configuration of the surface and the character of the rocks beneath it, along with lines, usually of a red color, examined for that purpose. These preliminary operations we are prepared with a view to which to proceed with the next division of our work, namely:

6. *Local Geology.*—In this department of the survey our main object will be, as before stated, to discover and classify

the mineral and metallic treasures which are buried beneath the surface of the earth; to ascertain their position and determine their abundance, so as to make them available for the industrial purposes of life. From the brief review which has already been given of the mining resources of the State, some idea may be formed of what discoveries are likely to be made of useful ores and minerals. No one can doubt that California is destined to take the highest rank as a mining State. All the more valuable materials occur here, and some, if not all of them, in unstinted quantity, and the requisite skill and capital will not be wanting for the development of the treasures which now lie hidden or imperfectly known, when the exact condition of things shall have been stated by official authority, and with impartial and unbiased judgment.

7. *Metalurgy.*—This department of the survey includes everything connected with the separation of the metals from their ores, by the various processes of crushing, washing, amalgamating or smelting; in short, all those operations by means of which the useful metals are converted from the mineralized condition in which most of them occur in Nature to the metallic form in which they are ready to be made available in the arts. In the prosecution of our work, it will be our duty to afford all possible assistance to those who are engaged in mining, or desirous of obtaining information about the best methods of dressing and smelting ores. The various mineral products furnished by the different mines will be carefully analyzed, as also the substances used for fuel or fluxes. And the best methods to be employed with reference to the peculiar condition of each mining district will be studied out and laid before the public, with full details of the processes adopted in other countries, so far as they were applicable to this region. In every new mining district there is always a formidable crop of new inventions springing up for dressing and smelting the ores which are found there; these are often old methods re-invented, processes which have already been tried elsewhere, and condemned, or such as are unsuited to the condition of things where they are attempted to be introduced. In such cases a little disinterested advice may often be the means of saving much delay, trouble and expense to those anxious to know the real truth.

The system of having assays made of picked specimens, and of basing estimates on the one-sided and incomplete information thus obtained, is one which is almost sure to lead to misapprehension and pecuniary loss. The value of a vein or deposit of ore depends on a variety of conditions, of which its average richness is an important one, of course; but this element of the calculation is not by any means to be obtained from an assay of a single selected sample, and one should no more base an estimate on such imperfect data, than he should judge of the value of a house by an inspection of a chip from one of its timbers.

That a practical geological survey will be of at least as much benefit to this State as any work of the kind has been to other regions, seems to me beyond a doubt. The great interest already manifested in the survey, both on the Atlantic side and in Europe, as evidenced by numerous letters from eminent men, received since it began to be spoken of, and the notices published in various influential journals, show that its results will everywhere be looked forward to with anxiety, as throwing light on questions of the highest importance to the world in general, as well as to the State of California.

It is my firm intention that every person connected with the survey should have no other aim in view than that of advancing the interests of the State. Whatever information of importance is obtained in the course of our investigations, shall be used, not for private advantage, but for the public good. To pronounce an unbiased opinion on the value of a mineral deposit, calmly to weigh all the conditions necessary to its successful development, to keep cool among the brilliant visions which any new revelation of the treasures which mother earth keeps hidden within her bosom is sure to call up; all this demands that the observer should have that disinterestedness which can only be found in one whose pockets can be in no wise affected by the result. There is a feeling of intense pleasure in being the means of unfolding new scientific truths, and opening up new avenues to wealth, which shall be open to all, and if our explorations should, as I trust they will, aid materially in developing the resources of this great State, I will cheerfully give the best years of my life to the work.

If I may be excused for speaking of myself, as seems to me proper, standing as I do before those to whom I am most directly responsible, and who have a right to catechize me as their employee, I would say that, although for twenty years constantly engaged in the examination of mines and mining property, I have never been the owner of a share of mining stock or a foot of mining ground, or, either directly or indirectly, pecuniarily interested in any enterprise or undertaking in any way connected with the mining interest. If I were, I should consider myself as unfitted for the position I now occupy. If my services are to be of any value to the State, it will be because what I have to report will be the exact truth, as far as my brains will allow me to find it out; and I think too highly of the intelligence of those now before me, and of the citizens of the State generally, to believe that any other course will be considered as tending in the slightest degree to the permanent welfare of the State.

It is not alone in its positive deductions and actual dis-

coveries that geological science may be of use to the State. There is a negative side to the question, and it is in the where the go-ahead element predominates, and it is in this, one of the principal objects of a geological survey is to limit the field of research for minerals, check useless expenditure, and prevent the throwing of time and money in searching for that which is not found, or which, when found, will be of no use. There is much excitement, so much of the lottery element with the mining business, especially in a new country, the disagreeable but necessary duty of quieting and excited expectations has often to be performed. It seems to be something connected with newly discovered mineral regions, which magnifies their resources to the eyes of those who first visit them. Three inches wide is almost certain to have a magnitude of at least three yards to the man who finds it, and it requires more than ordinary coolness of head to consider all the elements of success, when looking over a newly-opened deposit of ore. Hence the thing which every new mining region has to go to its lever. Thus, Lake Superior had, in 1845-6-7, a fever, which left the majority of persons who came to its sphere in a very low condition (as to purse) after the fever was over. Every other mining district open to the country has been the scene of a similar feverish and of wild speculation, which has often had the most serious effect on its development.

A vast amount of time, energy and money is completely thrown away in misdirected explorations and less mining operations. Means thus employed are lost to the State as if the amount in money which had been sunk in the depths of the ocean. The geological survey of the State of New York, and the fact demonstrated that no workable bed existed there, as large a sum had been expended and mining for that mineral as would have paid the whole survey.

The amount of "prospecting" or exploring for precious ores, now going on in this State, is astonishing. Hill and mountain valley, no matter how remote, and forbidding, is being pried into. Not a grizzled, the densest chapparal is sure that indications of gold will not be the cause of his being soon served with a remptory notice of ejectment. It is a matter of importance that this work should be well directed, would seem that the geological survey had been just at the right time in this respect. We cannot ourselves, do all this preliminary work of exploration, would not be sufficient for our little band, of persons at most, to examine every square rod of the square miles which make up the State, a territory as New York and all New England added to it, would probably 10,000 persons at work collecting material for inspection, and ready to direct our attention to important points, and in the interest of the State, it is our duty to examine, advise and report on what may have been discovered, as well as to discourage further operations, where there is evidently no prospect of success.

To use the geologist's motto—*Mente, manu, me loquere*—with head, hand and hammer, we will do our best to develop the resources of this great State, looking to you to furnish as long as our work shall appear to be for the public the material aid and comfort necessary to carry out the plans I have laid before you, and for your patient attention to which, gentlemen, I beg leave to return my sincere thanks.

ESMERALDA.—Our Esmeralda friends write us that prospects in that section continue encouraging. Improvements are being rapidly made, and prospecting is pushed forward with a very considerable degree of energy. The Utah Company have sunk some twenty-five feet on their lot, and find good rock. Holders, generally, are not anxious to sell, and hence but few transactions in claims are taking place, and the probability is that but few sales will take place such a time as a positive value is given, by a thorough test to the several ledges. The Sam Patch is affording good prospects. The Edward Everett stands well in the estimation of the community; its value will soon be thoroughly tested. Other claims are being prospected, and generally the miners are actively engaged with bright hopes for the future.—*Silver Age.*

THE MAIN GULCH FLUME.—We are pleased to learn that the stockholders of this company have decided to lower their flume. A committee from the company have waited on the owners of claims along the gulch, to ascertain whether the miner would make the necessary cutting for the flume across their claims, and we believe that, without an exception, they have all agreed to do so. The company will therefore be at no cost for grading, except at the stone bridge at Springfield.

The new flume, owing to the greater fall that will be given it, will not be more than eighteen feet deeper at the Mill street bridge than the present one. Even that will be a great advantage to the miners and the community. We understand the work has already been commenced.—*Columbia Times.*

THE American Mining company filed their certificate of incorporation in the Secretary of State's office, yesterday. Location of company's works, Amador county, capital stock \$200,000, in 2,000 shares.

Mechanical Preservation of Human Teeth.

Is tharticles preceeding this have been illustrated the same specific and general considerations for the preservation and perfection of teeth. In our last was a description of the form and character of the incrustation around the enamel of the root.

When any form of decay or waste is found in a tooth, it should immediately be arrested by excision, and diminished, or excised and filled by the surgeon dentist.

It is the province and profession to exempt the mouth from all possible disease appertaining to bone. If the patient is child, the incipient teeth should be extracted, and any that may be diseased and not sufficiently developed should be closed up with gold, platinum or tin foil; silver cement better than anything. This only should be used when a tooth is not eligible for anything else.

The same will, with same process, apply to the adult patient. When a patient has the above work done in the mouth, the main and principal object should be to eradicate every trace of disease from the mouth, such as caries, necrosis, etc. (an unnatural growth of bone; it originates from the surface of the maxillary and alveolar process.)

Teeth should then be well cleansed and every individual tooth should then be burnished with a fine steel burnisher. This forms an artificial and mechanical enamel for the tooth, where there has been any surface diseased that may have been excised or where the enamel is predisposed to grate or crack.

In it, there is no organ or combinations of organs around a whole system that is of so much consequence to general health as perfect, sound teeth and an uncontaminated mouth.

There abstract mode or procedure to mechanically preserve the teeth is the special labor, skill and study of the dentist. There are, however, more special qualifications that must be possessed. The first is a firm, steady and true nerve; second, he should be a good anatomist, which implies that he has a thorough knowledge of the whole structure, and especially around the head. I would never place a member of my family in a dentist's hands who did not have the two above qualifications, however good his other attainments.

Having given a cursory glance at the formation, structure and proper embodiment of perfect teeth, I will, in a future article, exhibit the proper mode of extracting diseased teeth and saving diseased bone from the face, nose and jaws, with perfect safety to the patient, and that artificial work can tactically substituted.

W. H. IRWIN, M. D.

The Purchase of Lower California.

Asident of this territory, I cannot but feel deeply interested in the purchase of the territory by the United States. Mr. Trist had almost positive instructions to make the line between the two countries the Gulf of California. When Mr. Buchanan was Secretary of State, the Cabinet was then unanimous in the opinion that the treaty should not be ratified on any other conditions, and Mr. Polk's message to the Senate informed that body that Mr. T. had not formed to his instructions in making the treaty. All this is to believe that this present administration would not over without the purchase of Lower California. During men catch at straws. We see in the message that the McLane treaty is not yet disposed of; that the government have agreed to pay a part of the Americans, and we cannot see how, except with the purchase of Lower California. San Francisco has a direct and interest in the purchase of Lower California. In two the Mexican trade would increase twenty-fold. It is to create an American interest on this coast that would all opposition.

We often spoken of our resources, climate, etc., but we forget out of the question, the geographical position of California makes it imperative that it should be to the United States, to secure the outlet of the Colorado Basin. It is even as important as was the purchase of the territory. It is well known that the mountains bordering the north of the valley of the Gila, contain immense riches in gold and copper, and when the remainder of this basin, with its numerous ranges of mountains shall be explored, who can foresee the immense wealth that will be yearly poured forth, and the fleets of ships that shall ply to the Gulf of California to deliver supplies to the dense population that may inhabit it.—*Cor. Alta.*

ENABAR.—The Scott Valley Mirror says cinabar in quantities has been found near Oro Fino. It has the appearance of being rich in quicksilver. A small piece was heated in an iron retort, and about an ounce of silver was obtained.

The Lost Silver Mine.

NOTWITHSTANDING the enormous amount of silver which the mines of Peru have yielded, only a very small portion of the silver veins have been worked. It is a well-known fact that the Indians are aware of the existence of many rich mines, the situation of which they will never disclose. Heretofore mining has been to them all toil and little profit, and it has bound them in chains from which they cannot easily emancipate themselves. For centuries past the knowledge of some of the richest similar mines has been, with inviolable secrecy, transmitted from father to son. All endeavors to prevail on them to divulge these secrets have been fruitless. In the village of Huancayo there lived, a few years ago, two brothers, Don Jose and Don Pedro Yriarte, two of the most eminent miners of Peru. Having obtained certain information that in the neighboring mountains there existed some veins of pure silver, they sent a young man, their agent, to endeavor to gain further knowledge on the subject. The agent took up his abode in the cottage of a shepherd, to whom, however, he gave not the slightest intimation of the object of his mission. After a little time an attachment grew up between the young man and the shepherd's daughter, and the girl promised to disclose to her lover the position of a very rich mine. On a certain day, when she was going out to tend her flock, she told him to follow at a distance, and to notice the spot where she let drop her mantle; by turning up the earth on that spot, she declared he would find the mouth of a mine. The young man did as he was directed, and after digging a short time, he discovered a mine of considerable depth, containing rich ore. Whilst he was engaged in breaking out the metal, he was joined by the girl's father, who expressed himself delighted at the discovery and offered to assist him. After they had been at work for some hours, the old Indian handed to his companion a cup of chicha, which the young man thankfully accepted. But he had no sooner tasted the liquor than he felt ill, and he soon became convinced that poison had been mixed with the beverage he had tasted. He snatched up the bag of metal he had collected, mounted his horse, and with the utmost speed rode off to Huancayo, where he related all that had occurred, described as accurately as he could the situation of the mine, and died on the next day. Active measures were immediately set on foot to trace out the mine, but without success. The Indian and his family had disappeared, and the mine was never discovered.

Santa Barbara Items.

We clip the following items from the Santa Barbara Gazette:

Santa Barbara county contains within its boundaries inexhaustible beds of asphaltum, and already two companies are at work, extracting petroleum. From the latter one of the companies are making good kerosene oil, which is pronounced by those of our citizens who are burning it superior to the imported coal oil.

Near Fort Bragg, in the northern part of the State, there has been found a spring or well that yields daily forty-five gallons of oil.

In several places in this county it has been found oozing from the earth; and it is expected that, by boring, plenty of it will be obtained.

About twenty miles from our city there have been discovered several veins of coal. Some of it has been sent to San Francisco to be tested. The result so far shows it to be superior to any yet found within the State of California.

The influenza has been prevailing in our town and vicinity during the past few weeks. Though it has been quite malignant in its form, yet we have heard of no case terminating fatally.

The sulphur mine recently opened at San Buenaventura, in this county, is likely to prove a profitable affair. The workmen engaged in mining there each average about twelve dollars a day.

MINING AT VOLCANO.—The miners in this vicinity are reaping a fair reward for their labor. Eli Van Clemen & Co., of Union Flat, cleaned up one hundred ounces of gold from a run of twenty days, and their next clean up will show still better. Their claim will last for years, and they richly deserve their success, having been engaged some three or four years in preparing to work their claim. Within the past ten days our bankers have purchased dust to the amount of \$24,000. This is the most certain indication we know of as to the results of mining operations in this vicinity. J. M. Tulloch brought into town a nice little lump of quartz gold, weighing eighty-five ounces, taken from a few tons of rock. He says "nuthin'," however, but looks very good-natured.—*Amador Ledger.*

LEAD AND COAL.—The Stockton Argus learns that a valuable lead mine has been found about thirty miles from that city, in the vicinity of Mount Diablo. It was found while the party who discovered it were hunting for coal. They struck a vein of lead several feet deep, about fifteen feet from the surface of the earth. The same party also discovered coal, the vein forty feet across at this surface.

RICH.—We saw, says the Nevada Journal, in the banking house of Mulford & Hagador, \$14,000 in bars, the purchase of two days. Some two hundred ounces besides were about to be put in the melting pot. The mines are but just beginning to yield for the season.

From the Colorado Mines.

Mr. J. C. Cooper, who left the Colorado country a few weeks since, called upon us yesterday, and furnished us with some interesting items concerning that new and attractive mining region. On the way to Los Angeles he met several parties bound to the mines, and in that city large numbers were preparing to start for the same place. Indeed, the traffic between Los Angeles and Potosi, the principal Colorado mining camp, was becoming so great that Mr. Johnson, an old stager, had arranged to establish a stage line between the two points, which was to have gone into operation on the eighteenth of March, and by this means it was claimed, the trip could be made in from two to three days. It was intended to make two trips a week each way, and to put the fare at a sum not to exceed twenty-five dollars. The business men of Los Angeles, too, had had a meeting to arrange for better facilities for traveling between their city and Potosi. Mr. Cooper thinks that the rush to the Colorado this summer will equal, if it does not exceed, that to Washoe last summer, and that the mineral revenues of the country will fully warrant it. Some very fine discoveries of silver, gold and tin have been lately made.

Provisions had been scarce at Potosi during the first few days of the present month; but on the tenth a large supply had been sent forward, by order of the Colorado Mining Company, from the popular house of Messrs. Corbett & Barker of Los Angeles.

The embryo city of Potosi is regularly laid out, and already boasts nearly a score of houses, while others are being erected. Potosi is located in latitude thirty-five degrees fifty-five minutes and longitude one hundred and fifteen degrees fifty minutes west from Greenwich.

Los Vegas springs and valley, situated thirty miles east of Potosi, have been taken up by a party at Marysville, who are planting grass, vegetables, and grain. They are also ranching stock, and have some meadow land. They will be able to supply the miners and the Salt Lake emigration with hay, grain, etc., at reasonable rates.—*Alta.*

The San Nicolas Mining Company.

About three years since a company was formed in Mexico to mine for silver in Lower California. They denounced twenty-seven mines here. The Governor, Casilla, conservador, issued an order that the denunciation of these mines should be respected. A report was industriously circulated that the company had received grants of these mines from the General Government. The question was brought into court a short time since, but the authority of the Government could not be produced. When this company was formed it was expected the United States would soon be in possession. When it is the documents will be produced, as many similarly obtained have been produced in Upper California.

This company sent a young man from Mexico, who had been educated in the Mining College there. He had a letter of credit for a few thousand dollars. The first year he shipped about one hundred tons of metal, the average value of which was about \$125 per ton; the cargo netted eighty dollars per ton profit. It was shipped to Hamburg, thence to Freiberg, where it was beneficiated. During this year Mr. Flores prospected a number of mines, but ultimately selected the San Nicolas, to which he turned all his attention. The bulk of the ore averages about eighty dollars per ton, but some portion is very rich, reaching as high as \$5,000 per ton. The second year he exported about nine hundred tons, and this year he has already shipped one hundred and fifty tons, and he has four hundred more ready to ship. The expenses of mining, shipping and beneficiations, are about forty dollars per ton; but as we do not know what proportion of the metal is of a high standard, we cannot estimate the profits. The lead has been worked for five miles, and always was supposed to be as good as the San Nicolas.

The San Nicolas Company have opened two more mines, the San Gertrudes on the same lead, and the San Joaquin.—*Correspondence Alta.*

AGRICULTURAL.—The Board of Directors of the State Agricultural Society held a meeting, a few evenings ago, at Agricultural Hall. A plan for the inclosure and improvement of the Stock Grounds of the Society was submitted, and, after discussion, adopted. According to this plan, the Stock Grounds are to be surrounded by a brick wall, eight inches thick and twelve feet high—entrance to be gained by six gateways. Inside, there will be constructed between five and six hundred stalls, a race-course of a mile in length, a carriage way, and seats for spectators. The inclosure will be ornamented with trees and shrubbery, and fountains of water will add to the appearance of the whole.

MINING.—From the Bald Hills we hear that up to within a few days all the companies have been doing well, and making from good to large wages. Now, however, their water has given out, or nearly so, and they are anxiously waiting more rain.

Mill Creek has not turned out equal to its prospects, and there will not probably be much mining done there.

Copper mining is still going on to some extent, the Evoca company being still engaged in going on with the tunnel of which we have before spoken. Some excitement was caused a few days since by the report that they had struck silver ore in that tunnel, but we believe the assay did not show it.—*Exchange.*

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....MARCH 30, 1861.

The MINING AND SCIENTIFIC PRESS is published every FRIDAY at rooms Nos. 20 & 21, Government House, corner of Washington and Sansome sts., by J. SILVERSMITH, Editor and Proprietor. At Fifty Cents per month, or \$4 per annum, in advance. Advertisements, Fifty Cents per line.

Ourselves.

TO-DAY we usher into existence the third volume of the MINING AND SCIENTIFIC PRESS. We herald this event to our kind readers with a marked degree of pleasure and satisfaction, having thus far prospered in our arduous labors in promoting the chief ends and purposes of our leading resources, comprising Mining, Manufactures, Agriculture, etc., on this coast. We have chronicled facts relating to these branches of industry which will tower as living monuments in the annals of the universe, never before accomplished by any other race or nation. Notwithstanding these accomplishments, we are awaiting events which will revolutionize the civilized world, with double the force and effect to that experienced in the earlier days of California's wealth. Myriads of feager miners will ere long wend their way to Washoe, Esmeralda, Coso, Mono and Potosi silver and gold fields. Sonora (Mexico) and Lower California are acquiring an American and foreign population, before whose sturdy arm the combined forces of aborigines must succumb, opening fields of mineral wealth perhaps greater in extent than any yet discovered. The recent coal discoveries near Monte Diablo are of such extraordinary importance to our prosperity and welfare, that we cannot find words to reach its ultimatum. Our prophecy with reference to California becoming an exporting State is soon being verified, as asserted by us nearly a year ago. It is but a short time since we announced the fact that a cargo of wheat had been shipped to England. How soon California may furnish her vastly superior coal, we leave time to divulge. In the acquisition of our State Geologist, J. D. Whitney, Esq., we shall be materially benefitted, in bringing before us the many paying resources, and other important and yet hidden treasures, in accordance with the Act passed, comprehending the most complete survey ever attempted by any of our sister States. With respect to peace and happiness of the citizens on this coast, we enjoy that in every particular, we being strictly a Union-loving people, though the existing crisis on the other side of the Pacific occasionally inspires a few hot-headed secessionists in our midst. The recent Act passed by the Federal Government, for a daily Overland Mail, is a measure calculated to bring us nearer to our social relations and cement us closer to their interests and fraternity. There is but one more object to be attained by us, which would fill up our cup of bliss and make glad the heart of every citizen of the Pacific—the building of a Pacific Railroad. We are on the track, however, of this project, despite the nefarious political tricking heretofore resorted to.

Y. M. D. C.—The next question for debate, before this club, which meets at the school-house, Jackson, on Tuesday evenings, is as follows: *Resolved*, That it would be good policy upon the part of the Free States to allow the Slave States to form a government of their own.—*Amador Ledger*. [The young men of Amador county have taken up the "nigger question." Your conclusions are anxiously looked for. At an early day we shall prepare an article entitled "Wool, Commercially." The secessionists of this State should become subscribers to the PRESS, if they value this article.—EDITOR PRESS.]

A SUCCESSFUL attempt was made some years ago in Prussia to use the heavenly lightning for blasting large rocks, which had obstinately withstood all other scientific means applied for this purpose. A large iron staff was inserted in the top of the granite, a hole having been previously made to the depth of about three inches. The first weather-loaded cloud passing, shivered the entire mass to thousands of fragments.

HERSPERIAN.—This beautifully illustrated monthly, edited by Mrs. F. H. Day, for April, has come, as usual, filled with its budget of fashion-plates, and interesting as well as instructive reading matter.

Joshua A. Clayton, Esq.,

HAS laid upon our table (and for which we return our thanks) a carefully and neatly printed map of the Esmeralda gold and silver mining district, in Utah Territory. Mr. Clayton enjoys on this coast, as well as in the Atlantic States, the renown as an able mining engineer. He has been one of the pioneers in the above new silver discovery, and consequently is well acquainted with the immense wealth yet hidden to us. The map gives us some forty-three established claims which is about one-fourth of the number of claims located. Mr. Clayton, in company with others, received, some time since, a grant from the authorities of the Esmeralda District, to build a toll road from Sweet-water ranch to the East Fork of Walker's river, thence to Aurora, a distance of twenty-three miles, at moderately low tollage. Mr. Clayton mentions the Wide West, Antelope, North Esmeralda, Silver Hill, Real del Monte, as some of the richest claims in existence there, all of which are incorporated. We learn that the compiler will soon leave for Esmeralda, where he intends to prosecute silver mining in all its details. He is now engaged in improving some important machinery for metallurgical purposes, which must soon prove of great interest to those extensively engaged in gold and silver mining. We are only too glad to make the acquaintance of Mr. Clayton, since he has promised us to write from this district in a knowing manner, and of its actual mineral wealth.

Deutscher Naturwissenschaftlicher Verein (German Natural-Scientific Association.)

AN intense degree of interest is being manifested among the German citizens of this city in establishing an association worthy of its undertaking. The above society numbers, since its recent organization, forty-five active members, and composed of practical as well as theoretical scientific gentlemen in all the modern and applied sciences of the age. Extensive preparations have been effected with persons living throughout the entire Pacific coast to communicate all that which may be useful and interesting in every branch of natural philosophy, but more especially in mineralogy, botany, and zoology. Though this association is of recent birth, yet they have acquired considerable property in beautiful specimens of rich and varied minerals, birds, insects and anatomical preparations, incident to the Pacific continent. At a meeting held on Wednesday evening last, it was suggested that lectures may be read before its members on subjects pertaining to science, which was unanimously acquiesced in. The MINING AND SCIENTIFIC PRESS, ere long (by the kind permission of the Literary and Publication Committee), will give one or two columns of the transactions of this association. The talent, learning and research of our German citizens are well established, and cannot but help to be productive of great benefits to its fellow-beings. The museum and place of meeting are over the Merchant's Exchange, on Clay street. Those having a surplus of useful works or scientific matter can donate these to this society, thereby becoming honorary or corresponding members.

TELEGRAPHIC ENTERPRISE.—P. McD. Collins, Esq., (whose reports as U. S. Consul on the commerce of the Amoor river first opened that new channel to our trade), has presented a memorial, asking Congress to provide for the survey of a route for a telegraph from the Russian Settlements, at the mouth of the Amoor river, to Sitka, the capital of Russian America. This is now the only unsurveyed portion of the telegraph route from Moscow to San Francisco, and on this entire route, only some thirty-nine miles, at Bebrings Straits, will necessarily be a submerged cable. This is pronounced in every way a practicable route, and it is to be hoped that we shall soon be able to receive telegrams from London, via Moscow and San Francisco.

[The feasibility of this project, as entertained by many of our commercial men, comprehends also the onward strides in our destiny. That California and the Pacific must ultimately be materially benefited thereby leaves no doubt in our mind. Then only shall we realize the immense advantages incident to our commercial interests, between the northern possessions, China, Japan, East India, and the European Continent.—EDITOR PRESS.]

RICH.—We saw one pan of dirt from Wallace & White's claim, in the edge of town, which yielded \$29 50, and there seems to be plenty more of the same sort. Mr. Purcell and Mr. Jenkins are working claims adjacent, which are also paying largely.—*Folsom Telegraph*.

Washoe and Esmeralda.

FROM all accounts, it would appear that the mining is opening in these districts with much activity, many people had arrived of late, and the business of mining, mostly suspended through the winter, was being revived with spirit and success. The business of opening already located was also going on vigorously, and prosecuted, with satisfactory results. The prospect that the present will prove a much more prosperous year than the last, and Washoe, relieved from the protracted winter and the terrors of an Indian war, enabled to repay a portion of the money it had drawn from the pockets of the confiding, and to some extent itself from its fallen estate. Even here, in San Francisco, confidence in the resources of these mines is being revived, and there is an increasing inquiry after class of stocks.

That this growing confidence is not altogether a foundation, it may be stated that there is now sufficient ore on the surface of the ground, taken from the surface claims at Virginia City, to repay the purchase of the present owners. A much larger quantity than suffice for this purpose, now lies at the mouth of the shaft, there being some 3000 tons, worth at least \$100,000. The ore already disposed of would yield, perhaps, an equal sum; and yet this mine is but barely opened, and hardly begun to be worked. In the Esmeralda District, comparatively little ore has yet been raised, though several have been sufficiently opened to demonstrate their productive character and warrant the undertaking of expensive works for extracting and reducing the ores. Over fifty thousand dollars have been spent on shafts and tunnels there, the cost of the machinery contracted for would reach double that sum.

It is believed there are at this time 15,000 people in the Eastern Slope, a number that is rapidly increasing, no doubt, be doubled within the current year. With the known mineral resources, and the advantages secured by the recent action of Congress and the Legislature, in extending to it a territorial and county organization, it can hardly fail to become rapidly peopled, develop itself into a wealthy and prosperous district, without desiring to overrate its advantages or encourage undue emigration thither, we think it may fairly be expected that this section presents a most inviting field for labor and the enterprise of our people.

The "Scientific American" makes the following comments upon the Passage of the Patent Law.

Our readers will remember that a bill to amend the Patent Laws passed the Senate during the last session, having originated in that body, it was sent to the House where it was amended in several particulars, and passed the 7th inst. From a synopsis of the amendments we append, our readers will observe that one of the amendments provides that there shall be no extension of time when the Commissioner is satisfied the net profits are \$100,000. This provision we hold to be very unnecessary, because it makes no discriminations between the value of inventions, and the genius and expense incurred in them to perfection. In our next issue, we shall have something more to say upon this subject. In the meantime, the bill goes to the Senate for concurrence in the amendments.

WASHINGTON, D. C. Feb. 7. The Senate bill, in addition to the act to promote progress of the useful arts, passed the House to-day with amendments; one of which provides that there shall be no extension of any patent when the Commissioner is satisfied that the net profits are \$100,000. All laws fixing a fee of \$100,000 to be paid, and discriminating between the claims of the United States and those of other countries, shall not discriminate against the inhabitants of the States are repealed, and in their stead certain regulations are established. The Commissioner is authorized to dispense with the future with models of designs, when the designs can be sufficiently represented by drawings.

Our ingenious countryman, Mr. Kesmodel, on Clay street, has shown us one of his new inventions in the form of bandages, which bids fair, we think, to be of great benefit to those sufferers who are compelled to wear them. It is a truss of an entire new construction, for which letters are applied, and soon expected. We will refer to

CONSTINE & FOX.

We present this week one of the most extensive furniture houses ever established here. In Vol. 1, No. 8, of the *SCIENTIFIC PRESS* may be found an illustration and description, with details of the business there conducted by MESSRS. JONAS G. CLARK & Co. These premises have undergone thorough repairs and embellishments. Messrs. Constine & Fox, whose popularity exceeds all others in this line in the city, occupy the whole of the second and third stories, which they have stocked with the most costly and finely-finished furniture now to be had in this State. Mr. Fox has just returned from the Atlantic States, where he has effected regular shipments for their house.

No better evidence of the vastness of the business can be adduced than their premises, No. 510 Washington street—a three-story brick edifice, running through to Jackson street, 275 feet in depth, being the largest store on the Pacific. Here is exposed every conceivable article of household furniture, from the plainest and most substantial to the most elaborate and costly work, which rivals the factories of Europe for delicacy and beauty of fabric. Here all tastes and purses can be suited, and every taste satisfied.

So favorably are their style and work known, that large orders are constantly received from Mexico, the British Possessions, the Sandwich Islands South America and the China seas. Some of their manufacture have been sent to Japan and the Amoor river. In the former country the California-made furniture has been adopted as models by the Japanese, in lieu of the antiquated Dutch styles, heretofore in use. As the means and materials for home manufacture increase, so do MESSRS. CONSTINE & FOX enlarge their sphere, and the day is not far distant when they will turn out nothing but of local make.

PAWNBROKERS.—A bill has been referred to the Assembly Judiciary Committee, requiring pawnbrokers to keep an exact account of their transactions, and forbidding them to charge more than four per cent, and politely requesting them not to compound the interest, either.

[The above bill, as presented by the Judiciary Committee, is one of deserving credit, and we hope that this may become a law. The rascally practices resorted to by a few in this traffic require the most strenuous and effective enactments, together with the vigilance of the police, that can be put in operation. Long since a petty thief extracted from our apartments a fine black coat, which was sold or pawned to one of these brokers for the trifling sum of five dollars, for which we paid forty-five dollars. We know this harborer of stolen property, whose premises should be under the surveillance of the police. Unless he makes good our loss, we shall be compelled to expose his petty transactions. He keeps on Dupont street.—EDITOR PRESS.]

MORE MACHINERY.—Another shipment of quartz machinery was landed at the levee yesterday morning from San Francisco, consigned to parties at Gold Hill and Virginia City.

Notices of the Press.

THE MINING AND SCIENTIFIC PRESS.—We take great pleasure in recommending this valuable journal to the notice of our mining friends. In it they will find much that is important and instructive. Each number, issued weekly, contains extracts from the latest works on subjects connected with mining, minerals and metals, assaying etc., besides the current news of the day, on these interesting subjects. The price of the *MINING AND SCIENTIFIC PRESS*, being but four dollars per annum, places it within the reach of every one.—*Calaveras Times*.

MINING AND SCIENTIFIC PRESS.—This valuable paper, devoted to the arts, mining, manufacturing, and agricultural interests, is published by J. Silversmith, at San Francisco, for four dollars per year. The *PRESS* is conducted with much care and ability, and it should succeed.—*Mount Messenger*.

MINING AND SCIENTIFIC PRESS.—We are in receipt of this excellent journal, published by J. Silversmith at San Francisco. It is issued weekly, at four dollars per annum, and we recommend it to the favorable notice of our mechanics, miners, and the public generally.—*Cal. Chronicle*.

MINING AND SCIENTIFIC PRESS.—J. Silversmith, San Francisco; four dollars per year. We receive it regularly, and are convinced that it should be regularly in the possession of the miner and the mechanic.—*Amador Ledger*.

HYDRAULIC MINING HOSE.—An immense quantity of duck is imported into San Francisco, with which to supply the demand in the interior for hose used in hydraulic mining. The *Boston Transcript* says, that the duck factory at Lowell is kept running on extra time, and is yet unable to supply the orders received. They had better erect another mill as fast as possible, for the field in which the hydraulic hose is used is constantly extending in California.

[We have in this city several establishments manufacturing hose for hydraulic mining purposes, which must soon become an important business in California. Hydraulic mining has heretofore proved lucrative, and is likely to do so for ages to come. We have noted many improvements in this branch of mining, especially Messrs. Smith & Low's Hydraulic Water Distributor, an invention highly valued by those now using it.—EDITOR PRESS.]

Dr. J. Marks of Auburn, Placer county, has been appointed Vaccine Agent for this State, says the *Placer Herald*, and adds, under the law it is made the duty of the agent, upon the receipt of the proper fees, upon any regular physician applying to him, to furnish genuine matter, with an accompanying certificate to that effect. The State agent is required to obtain vaccine matter from the agent of the United States, appointed under the laws of Congress. The Governor has made a good selection.

[We concur in the above. The appointee, Dr. J. Marks, whom we have known for a number of years, is deserving of his appointment. Doc. please write us respecting vaccination.—ED. PRESS.]

Mining Intelligence.

We extract the following correspondence from an interior exchange:

SPRING GROVE, Beaver Creek, March 10th, 1861.

Almost one month has elapsed since I last wrote you from the South Fork of Hungry Creek. Since then I have changed my place of abode, have moved from among the snow-clouds of the north and "faced the music" of the gentle zephyrs among the Beaver hills, and am now searching for the "yellow boys" in the wrinkles of the slate and granite bed rock, for which this section of country is so notorious.

The miners of this vicinity think this camp the most extensive north of the Colorado, and some even think it the richest. I give below the facts in reference to pay, etc., particularly the seven claims above this place, owned by Ziegler & Co., Spinner & Co., Meyers & Co., King & Co., or Bay State, Flying Dutchman, Gunnason & Co., and Saxel & Co. The above claims join one another and are all paying well. The most of them are large claims, containing from three to five hundred yards each. The "auriferous lodes" has prompted our miners to grasp all the ground they could possibly hold. The Gunnason claim has been worked for five years, and has averaged fifteen dollars a day. Last week, three men washing, they made in two days, \$250. Saxel's claim has paid good wages, say from eight to twelve dollars a day to the hand. The claim known as the Flying Dutchman was sold last spring for \$1700, and the company worked the same to a great disadvantage for some time, when they sold to the company now working it. It is opened in good shape now and prospects thirty dollars a day to the hand. Only two days' work has been done in the cut, one man shoveling the pay-dirt into the sluice, for which the company cleaned up sixty dollars. Twelve dollars to the pan was found snugly stowed away in a crevice, in the bed rock. The Bay State Company are taking out from twenty to sixty dollars a day. The claim of Meyers & Co. is paying from eight to fifteen dollars a day to the hand; also the claim of Spinner. Ziegler & Co.'s claim is not in working condition at this time, but will be soon. I hear that Sears' claim, on Upper Beaver, is paying from fifty to seventy dollars to the sluice; also the claim of A. D. Sloan.

So long as our claims pay as well they do at present, we are not inclined to "secede" until they are worked out. We can afford to pay our taxes, build our roads, and "face the music" generally. When our claims are worked out, we hope then to have accumulated enough of the "yellow boys."

Overland Daily Mail.

NEXT to a railroad to the Pacific, an overland daily mail is something which Californians have most desired. It will be seen by late Pony news that Congress has passed a bill to that effect. A Pony Express is also kept up. When the daily line of overland stages is once thoroughly established, the route will be the popular method of going to and coming from the old States. Stations will be built at convenient intervals along the road, and passengers can find good accommodations during the whole journey. With good military posts scattered along, to protect the travelers, hundreds will go through in their own conveyances or on horseback, thus giving every one a chance to go and come as he may choose. A trip over the plains will be a pleasant excursion, and many would avail themselves of such an opportunity who would never venture on the ocean. By taking time, a person could visit his friends in the Atlantic States for a little money, and, at the same time, have a pleasant and healthy journey. The overland mail will make a revolution in California travel—confining it almost entirely to our own domains, thus leaving an immense amount of money among our own people, which is now squandered on rich monopolies.—*Calaveras Chronicle*.

PACIFIC MAIL STEAMSHIP COMPANY'S line to PANAMA connecting via the Panama Railroad with the steamers of the Atlantic and Pacific Steamship Company, at Aspinwall.

FOR PANAMA,

DEPARTURE FROM FOLSOM STREET WHARF.

The Steamship

SONORA,

Baby Commander

Will leave Folsom Street Wharf, with Passengers and Treasure, for Panama

MONDAY April 1, 1861,

AT 9 O'CLOCK, A. M., PUNCTUALLY,

And connect, via Panama Railroad, at Aspinwall, with steamships for N. York

REFINED LOAF AND CRUSHED SUGAR, FOR EXPORT.

The San Francisco Sugar Refining Co. are now prepared to execute orders for Refined Loaf and Crushed Sugars, for export, at the current prices ruling for Eastern Refined Sugars, the purchasers receiving the benefit of the drawback allowed by the United States Government, of one and a half cent per pound upon the quantity exported. Apply at the office of
S. F. SUGAR REFINING CO.
59 and 61 Sansome Street.

Miners' Divining Rods.

The mining business seems to be on the look up. Almost every day we hear of some new party coming in to mine, and of some new discovery of ore. One miner came in town the other day from about four miles out, near the Lambert diggings, and said he had found mineral so large that he could not get it out with a pick, and had come to get "gads" (small iron wedges) to split up the ore. He mined by divining or dowsing rod, and believed that he was indebted for the discovery to its influence. Whether the science of geology, practical observation, luck, or the divining rod was used so that the ore was discovered, the main point was gained.

The system of prospecting for ores and buried treasures by divining rods is of very ancient date, and is based on the theory of an electrometer being formed so sensitive that the smallest electric current which could flow off from a vein or mass of ore would either attract or repel it; and in this way the position of the vein would be indicated. How much credit should be given to the system we are not prepared to say. It may be proper to add that the evidence of the diviners, or mineral rod miners, have not yet sufficiently permeated our opaque mind to fully convince us that the rod is at all times correct.

Had they done so, we should daily and hourly be found crossing the ridges and valleys, with a rod in hand, expecting it to dip, it being drawn down by a mammoth load of ore. Probably practical observation is about the best guide to the miner, and this is all founded on the geology of the lead fields. Geology is not, as some people suppose, a science that should tell what the center of the globe is formed of, but is more particularly a science learned by observation and to be used to classify and tell the ages of sandstones, limestones, tuffs, flints, red clay and surface and rock ores, found in the hills around Potosi and throughout the lead fields.—*Potosi Miner*.

The Mineral Wealth of Lower California.

NOWHERE have we ever looked for mines that we have not found them—on the hills, in the valleys, and on the islands. The other day a sample of metal was handed me for silver. The microscope showed the presence of gold. In Alta California such quartz would pay to work; here it must pay to export, or it is worth nothing. Last year a friend handed me a stone which looked like ore; he said he had picked it up in a creek near Angel Island. It was mostly pure galena, and assayed for silver five dollars and fifty cents per ton. A few days since two men who had come from the frontier, by land, brought a number of specimens of gold quartz. I can count silver veins in which never has a bar or pick been struck, by the hundreds. Lower California is destined some day to create a sensation equal to Washoe, but I suppose our time has not come yet.

Your readers may believe if such things were true, they would excite attention in Mazatlan, where capital is plenty. Perhaps you forget we have no newspapers to get up an excitement. Things are made public here as they are with you. Mazatlan people who are successful here keep quiet, or endeavor to lead others astray, and among the Mazatlan merchants there is no enterprise for anything out of the regular routine of their business, and why should they, their fortunes are so sure. They succeed one another like the seasons. Five years at the head of a house is considered long enough to ensure a competent fortune. All the business capital belongs to Europe, and the incumbent head of the house has only his temporary interest in it. He commences usually in the concern a clerk, and succeeds his superior after a short probation. He never surrounds himself by any ties to secure his interest in anything but his business.—*Cor. Alta*.

Grand Invention.

The labors of Daguerre and Morse in the photographic and telegraph lines are appreciated as developing in a remarkable degree the capacity of the human mind to consummate astounding results. Should the result of their labors, and those of their successors, be combined by some genius, enabling us to transmit by telegraph correct copies of photographs, the world would stand aghast—regard the fact as indicative that man is a scintillation of the Deity, and is endowed with an illimitable capacity (which is being gradually developed) to reduce the material to his will. The idea of this combination has been and is entertained, been discussed by two of our citizens. Should they succeed they will have made a remarkable stride in the path of science, and yet it would not be regarded at the present day as more wonderful or impracticable than when the transmission of messages by the electro-magnetic telegraph was first broached. Should the projectors start in we hope they will give us a few shares of the stock in the company. We would willingly yield all our interest in the Washoe and Esmeralda mines in reciprocation.—*Sac. News*.

TENESCAL TIN MINES.—Speaking of these mines the Los Angeles *Star* says, some ore taken from them assayed as high as sixty-five per cent. This is an enormous yield. The parties working the Cajalco mines have again struck the vein; they are about sixty feet deep. It appears the vein at times becomes very narrow, then is lost, and shortly after again struck, the ore then being found in masses and almost pure.

THERE are upwards of 600 bee-hives in successful operation in Los Angeles county.

Gold Discoveries in Lagrange.

CONSIDERABLE excitement has been occasioned by the recent discovery of rich deposits of copper and silver ore in the vicinity of Hobert's Ranch, on the road leading from the Crimea House to Don Pedro's Bar. Of course there is the usual rush and claims are staked off with the greatest confidence in the minerals which are hidden from the sight, but loom up like oceans of wealth in the imagination. There is unquestionably a rich mineral district in the locality above named; but like all other mining grounds it is susceptible of exaggeration to an extent only known to Californian miners in early days. There has also been a discovery of rich placer diggings near Murray's bridge, on the Merced river, some three-quarters of a mile from the line of the present channel. These diggings have suddenly acquired a population astonishing to the "natives" who have resided in that locality for years in most profound ignorance that the channel of the river ever verged in any other direction than that to which their labors had hitherto been confined. The new mining district is in part upon the farm of Mr. Ivet; and it is highly probable that the miners will very soon convert the farming land into that of mining, even at the risk of incurring the displeasure of the proprietor.

A foundry has been started at Nelson's Mill, and there is every indication that it will be profitable to its founders and convenient to the farmers and miners in the neighborhood in which it is located.—*Mirror*.

RICH ORE FROM ESMERALDA.—Several sacks of silver ore have lately been brought down from the Esmeralda mines, for the purpose of being reduced as tests of the claims they represent. This ore was taken from the Utah and Clipper ledges, and is said to be a fair sample of large quantities to be found in those claims. Its average yield is about \$500 in silver to the ton, specimens going as high as \$3000 under assay. Many of the leads in this district are now known to be rich, and there is no question but it contains immense mineral wealth—possibly some of the richest mines in the world.

MINING INTELLIGENCE.—Reports from all the mining precincts in this country are most favorable to a richer yield this season than ever known before. New and improved facilities have been discovered and brought into practical successful operation by the quartz and tunnel miners which render the process of abstracting the gold from the rock and dirt more easy and produce more abundant yields. El Dorado will produce more gold this year than any other county in the State.

STEAM DITCHING MACHINE.—This new invention, which seems destined to effect a revolution in ditching processes, will, when fairly under way, cut a ditch about two feet four inches deep three feet four inches in width at the top and two feet six inches at the bottom—eighteen feet in five minutes. It is now in operation in Sacramento.

BIG YIELD AT TIMBUCTOO.—We are indebted to Mr. J. E. Moody for the intelligence that the Union Company, at Timbuctoo, cleaned up, after twelve days' run, \$5,528, which is said to be the heaviest run ever made in that place. Hurrah for "the Union!"—*Appeal*.

ALREADY GOING BY HUNDREDS.—In three days, two hundred men passed through Visalia, on their way to Coso and Mono. Thousands, throughout the State, are on the eve of departure for the Eastern Slope.

LANN SLIDE.—A large part of Wet Hill, near Nevada, is making a movement towards water. Millions of tons of earth have commenced to slide. It is a sight says the *Journal* worth seeing.

EAGLE CREEK.—The miners in the vicinity of Eagle Creek are making good wages at the present time. Some of the hills bordering on the creek have been prospected with great success.

COPPEROPOLIS.—This is the name of a new town which is springing up in the region of the copper mines in the southwest corner of Calaveras county.

COPPER ORE.—Three hundred sacks of copper ore have been prepared at Copperopolis, Calaveras county, for shipment to Boston, where the ore is to be smelted.

H. CASEBOLT & CO.,
CARRIAGE MANUFACTURERS,

IMPORTERS AND DEALERS IN

Carriages, Buggies, Wagons,

And a general assortment of

CARRIAGE AND WAGON STOCK, TRIMMINGS, ETC.,

Nos. 532, 534 and 536 Market street, near Montgomery, [North side].

Wagons and Carriages of every description made to order, stored and sold on commission; also, bought and exchanged; and general jobbing done with neatness and dispatch.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Central, \$700 per foot.
Ophir, \$750 per foot.
Gould & Curry, \$215 per foot.
Chollar, \$20 per foot.
Lucerne, \$30 per foot.
St. Louis, \$35 per foot.
Mount Davidson, \$25 per foot.
Mark Antony, \$15 per foot.
Louise, \$16 per foot.
Bradlee, \$8 per foot.
Post, \$6 per foot.
Maston, \$5 per foot.
Lacy, \$5 per foot.
Sacramento, \$10.

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 2; issue, \$200 per share.
Transactions limited.

[Having completed all the requisite arrangements, we shall in future be able to lay before our readers a reliable list of prices of mining stocks of California and Utah.]

WOOD'S CALIFORNIA DIGEST.

TESTIMONIALS.

FROM THE PRESS, BENCH AND BAR.

[From the Sacramento Union, October 27, 1857.]

The Digest is more complete in its arrangements, and more perfect in its Indexes, References and Appendix, than any we have hitherto examined. It contains a great variety of interesting matter, very clearly arranged; will prove a great convenience to the profession, and put into the hands of the people the laws of the State, compiled in so perfect and simple a manner as to enable any man to find any law in a few moments, which he may wish to examine. Mr. Wood has further exhibited the good taste and State pride to have his Digest printed in California.

[From the San Francisco Herald, October 23, 1857.]

WOOD'S DIGEST.—A copy of this much-needed work has been laid before us. We congratulate the Bench and Bar, indeed, the public generally, upon the manner in which this work has been gotten up. The arrangement is systematic and excellent. It has a copious Index, and the reader will experience no difficulty in finding any portion of the contents to which he may desire to refer. Great labor is saved by a ready access to the Laws and Decisions. It will prove an invaluable aid to the judge and lawyer—indeed, it will be of valuable assistance to all public officers, State and Federal, and to business men generally. Such an enterprise deserves to be rewarded, and we trust that the industrious and excellent compiler will find his labors amply compensated and generously appreciated by our people.

[From Hon. M. Hall McAllister, February 5, 1861.]

It has been but a brief time in my hands, but I am prompted by the examination to have allowed me to give it, to say, it is a work demanded by the wants of the State, and will not only prove acceptable to the profession, but be a valuable work to the mercantile and other classes of our people.

THE BALL IS STARTED! KEEP IT IN MOTION!

The enemy has surrendered without firing a single gun; five thousand of our best citizens have declared in favor of home manufactures within the last five days, and will give their

REPUDIATION

to the imported article. Our young State feels herself strong enough to do all her own work; let our own mechanics have a chance now! Everybody should call and judge for himself, and order his Safe; then he will know what he gets for his money.

IMPROVED VULCANIZED
GUTTA-PERCHA BELT.

We are now prepared to furnish to Machinists, Engineers, Millers and others, the above article of

Machine Belting,

which has been proved to be far superior to any other kind in use, being ENTIRELY FREE from the undesirable qualities of both Leather and Rubber.

While possessing the good qualities of both,

IT DOES NOT STRETCH,

it is not affected by oil, heat or steam; and in fact, is well nigh PERFECT, as all who have used it attest.

Besides all this, the fact that

It Costs Less

than either Leather or Rubber, which makes it supersede them altogether as soon as its merits are known.

We have also produced an article of

HYDRAULIC MINING HOSE,

which is offered to miners as SUPERIOR to any other article heretofore used for this purpose. It is made to

Stand Any Pressure Required.

Will WEAR LONGER than any other article; will not Mildew or Rot; costs a moderate price, and is altogether

THE BEST AND MOST ECONOMICAL HOSE

ever used in California. It is made four and a half to eight inches in diameter, of different thickness, and stretch to stand pressure of from fifty to 200 feet perpendicular fall.

A CARD.

With due deference to my Friends and the Public at Large, Invalids especially.

I have exercised my profession as Physician and Surgeon in the City of Sacramento, Capital of the State of California, nearly six years. There, as usual, I have acquired credentials commensurate with my unparalleled success in practice, as evident from the fact that while resident of said city, I admitted under my care upwards of 1000 invalids, who applied to me as their last resort (nearly three-fourths of whom were of the female sex) as all of them were laboring under diversified chronic diseases, such as had already baffled the skill and remedies of their former physicians, who had pronounced their cases incurable, and they ultimately had given them up to their fate. Yet in all, with few exceptions, I performed radical cures. I obtained from these restored patients, and also from other similar cases in other climates where I have practiced, upwards of 1000 certificates, sworn to and approved by the highest authority. I shall have them in readiness for the inspection of ladies and gentlemen who may honor me with a call. These heretofore appended are a sample of those in my possession.

I removed from the city of Sacramento in order to proceed to the Atlantic States, but being unavoidably detained several months, I concluded, at the earnest solicitation of my numerous friends, to resume my practice in this city.

As usual, no other but invalids who may apply to me as their last resort, will be admitted under my care.

Office and Residence, 235 Washington street, corner of Waverly Place, above Dupont. Hours of Consultation, from 10 o'clock A. M. to 2 P. M. San Francisco, February 26th, 1861. J. PAYSANT, M. D.

We, the undersigned, citizens of Sacramento City and vicinity, do hereby certify to all who may be concerned that we, or members of our family, have been seriously afflicted under diversified chronic diseases; most of them were of an alarming nature, inasmuch as they had already baffled the skill and remedies of former physicians, who had despaired of a cure. Under these circumstances, they or we were placed under the care of Dr. J. Paysant, Physician and Surgeon of this city, who soon displayed his skillful prescriptions, conjoined with the effectual use of his invaluable remedies, and in all cases succeeded in relieving or completed radical cures.

Convinced with the above, we have had a fair opportunity to witness many other cases similar to ours, among our relatives and friends, who were left by their physicians in a hopeless condition. They applied to Dr. J. Paysant, who also succeeded in restoring them all to a sound health.

Consequently, we render this, our testimonial of Dr. J. Paysant's superior skill as a physician and surgeon, and recommend him as such to our friends and the public generally.

M. K. Murphy,	Alph Dunniaga,	A. W. Dunnigan,
Il. Lockwood,	M. L. Burk,	Wm. Beckman,
Albert Froeze,	Woodruff Clark,	Wm. Jackson,
	W. W. Rogers,	A. G. Curtis.

State of California, City and County of Sacramento.—Before me, Thomas Conger, a Justice of the Peace in and for the city and county aforesaid, personally came the persons whose names are subscribed to the above certificate, who each subscribed their respective names in my presence, and being by me sworn, each of them, upon oath, declared the foregoing certificate to be true, and further certify that I am personally acquainted with most of the subscribers, and know them to be highly respectable and intellectual gentlemen.

THOMAS CONGER, Justice of the Peace.

Sacramento City, September 24, 1857.

We, the undersigned, having had ample opportunity to peruse many certificates, which were executed, signed and sworn to or approved by many persons, some of them being in the highest positions, politically and otherwise: such as James Buchanan, then Secretary of State and late President of the United States; John McLean, Associate Judge of the U. S. Supreme Court. A. G. Brown, then Governor of the State of Mississippi; Bishop Thomas A. Morris, and many others of like respectability, both in the Eastern States and in California, who expressed themselves in the strongest and most decided commendatory terms of the skill and ability of Dr. J. Paysant as a Physician and surgeon, and also of his medicinal preparations, possessing salutary influences on the human system. We concur with them in their opinions and commendations, and we likewise recommend Dr. J. Paysant and his medicine to our friends and the public at large, invalids in particular.

John R. Weller,	Alfred Redington,	L. Stanford,
Ferris Forman,	Thomas Findley,	A. R. Meloney.

Electro-Hydropathic and Eclectic Institute, Nos. 625 and 627 Market street, opposite Montgomery. The proprietor of this Institute, having been prevailed upon by Medical Gentlemen to open this establishment for the treatment of various diseases, in which he has been eminently successful in effecting permanent cures of numerous cases of Neuralgia, Rheumatism, and primitive stages of Consumption, sent to him by scientific medical gentlemen, would simply state that he has spent much time during the last fifteen years in studying the nature of Electricity, and has for the past five years applied it for medical purposes, with such success as to warrant him in feeling confident that he can do justice to any case that may be entrusted to his care.

For the truth of these assertions he can refer to responsible parties in this city and throughout the State, who have been cured of the worst diseases by his treatment.

Any physician wishing to send patients in this establishment may be assured that they will be treated strictly in accordance with their directions. This Institute has been fitted up in fine style and will be open for the reception of patients on or before the first of February.

A competent and experienced lady will be in attendance to take charge of the Ladies' Department.

Metallic Minerals.

The metals and their various ores afford a great variety of minerals. Few metals, except gold and platinum, are commonly found in a state of purity, or native, as it is called by mineralogists. They are commonly combined either with oxygen or with some of the various acids, such as the sulphuric, the carbonic, or the nitric. I shall here content myself with briefly mentioning the usual way in which some of the most common metals occur.

Tin is commonly found as an oxyd in an ore called tin-stone, or sometimes woodstone, from its looking like petrified wood, or steam tin, from its being found in rolled places in the beds of streams. It is also found in veins in granite and other rocks.

Iron is occasionally found "native" in rocks, but more frequently in meteoric stones that have fallen from the sky, and which almost invariably also contain a small proportion of the rarer metal "nickel," combined with sulphuric acid; iron makes the very abundant mineral iron pyrites.

Specular iron, Hematite, Micaceous iron ore, are all oxyds of iron, found in crevices or veins of many rocks; sometimes also these ores occur in beds, and occasionally in considerable abundance.

Spathic, or Sparry iron, is a carbonate of iron, and of this the common clay ironstone is an uncrystallized earthy looking variety; this is the most abundant of the ores of iron, and that from which the greatest quantity of metal is produced. It occurs in beds, either in regular seams or floors, a few inches or a foot or two in thickness, or in layers of hills and nodules. When several such layers occur very close together, they make a very valuable seam, and in mining districts each of them is commonly known by a particular name.

Manganese has never been found native. Black oxyd of manganese is the most common ore of this metal, and it occurs very abundantly in many rocks, and in many different countries.

Zinc is not found native, and sulphuret of zinc, called blende, or black-jack, is its most common ore; it occurs in many mineral veins, very abundantly in many countries.

Calamine is a carbonate of zinc, and likewise occurs in veins pretty abundantly.

Lead has been found native but rarely. Its most common ore is called galena, or sulphuret of lead, which occurs in veins or great cracks of the harder rocks, varying in width from a few inches to several feet, and being commonly more or less nearly perpendicular. It often contains a slight proportion of silver, sometimes as much as sixty ounces to the ton of lead. Carbonate of lead is a white earthy-looking mineral, which might be mistaken for carbonate of lime, or sulphate of baryta, at a hasty glance; it was so mistaken formerly in Derbyshire, and thrown away as a spar, until some one with a little knowledge of mineralogy pointed out its true value.

Copper is not unfrequently met with native, but not often in any considerable quantity. Its most common ore is copper pyrites, which look like iron pyrites, but may be known from that mineral by its being capable of being cut with a knife, which iron pyrites is not. It occurs in veins in the same way that lead does.

Red oxyd of copper occurs pretty abundantly; and several other ores, among which must especially be mentioned malachite, or the green carbonate of copper, which occurs frequently in the upper parts of a vein; and seems to be the result of the decomposition of other ores, and the union of the metal with carbonic acid. This splendid ore is split into thin slices, and used for inlaying and ornamental work.

Mercury does exist in the native state, but its most usual ore is cinnabar, or sulphuret of mercury, a beautiful red-colored ore, which is said to occur in beds in some slate rocks, but is also found in veins with other ores. There is also an amalgam, or mixture of mercury and silver, said to be found in Germany. Mercury has the property of instantly uniting with either gold or silver wherever they are brought into contact, and forming a compound with them called amalgam.

Silver is common, native, in small quantities; and in some places, as in Norway, magnificent blocks of native silver have been found, weighing even as much as five cwt. Of the ores of silver found in veins in the rocks, like other metallic ores, the most abundant are silverglance, or sulphuret of silver, pyrargyrite, called also ruby silver or black silver, stephaute or brittle silver ore, and horn silver, or chlorid of silver. Much silver is extracted from lead after that metal has been reduced from its ores.

Platinum is only found native or mingled with other rare metals, such as iridium, rhodium, and palladium. It is got principally in Russia; but small quantities are procured from many other countries. It is the heaviest of all metals excepting gold. Coins are made of it in Russia.

Gold is never found otherwise than native, though it often contains slight admixtures of silver or other metals. Its original site is almost invariably the veins of quartz, which are found so abundantly traversing all the harder rocks. It has, however, been washed out of these in large quantities by natural agencies, and has been, and is now, found among the superficial gravels, sands and clays of nearly all countries that contain mountains of hard rock. The principal sup-

plies of gold are now derived from washing these loose materials in Australia, California, and on the flanks of the Ural mountains. Gold-mining, or extracting it by the aid of machinery from the hard veins in the solid rocks, is commonly not so profitable as gold-washing, or resifting those broken materials which nature herself has crushed, powdered and partly washed, and sorted to her own processes ready to our hands. Many other minerals besides quartz, and especially all iron pyrites, contain minute quantities of gold, sometimes in sufficient quantities to pay for the expense of extracting it.

There are, in addition to the minerals already described, some other mineral substances which are met with in hooks on mineralogy, such as amber, jet, bitumen or asphalt or naphtha, hatchetite or mineral tallow, elaterite or mineral caoutchouc, and coal. None of these, however, are minerals in the restricted sense of the word we have spoken of before, being either organic compounds, such as gums, or other vegetable products, in a fossil state; or the products of the decomposition of animal and vegetable substances; or else, like coal, they are masses of organic matter, sometimes, perhaps, animal, but much more often vegetable, mingled with more or less of earthy matter in every proportion, and buried in the earth by natural causes, where they have become subject to several chemical actions, and become more or less mineralized as it may be called. They are not, however, true or perfect minerals until, as in the diamond, they assume a crystalline form, and thus throw aside all trace of their organic origin and structure.

Mining Invention.

SAN-JUAN is a great place for inventive genius. In addition to what has been already produced, witness the following. The San Juan Press says: San Juan boasts another inventor. Our neighbor, Jo. Thomas, has just completed the model of a drum for saving gold in quartz mining, which, it strikes us, must come into general use, and which can be seen on the hill in the rear of Mr. Soule's residence. The invention is a sheet-iron drum, ten feet in length and three in diameter, in exact resemblance to a steam boiler. An iron axle traverses the center of the interior, longitudinally, which is held to its place by six series of spokes, with fellows, like those of a wagon wheel, which fellows are joined and form complete circles around the inside of the drum, and serve as "rifles," against which the quicksilver is deposited. The drum is placed at an angle of one-half inch to the foot, and has a rotary motion in a box, similar in appearance to a wayside watering trough, at one end of which there is a gate for the escape of sand, gravel and water. The pulverized quartz is precipitated with a steady stream of water into this revolving drum, where the current becomes almost imperceptible, and is yet so complete as to permit the escape of all the tailings without the loss of any gold, or what little may escape from the drum is sure to be caught in the trough, where there is also a deposit of quicksilver. Mr. Thomas has made an application for a patent.

PATENT LAW AMENDMENT OF 1861.

How to Obtain Patents Under the New Law.

The Patent Law Amendment Act, passed March 4th, 1861, and now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The first question, therefore, that presents itself to the inventor, who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for patent to the Government, embracing a petition, specification, model, duplicate, drawings, and the payment of the prescribed official fees. Aside from these steps, all the inventor can do is, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinion and advice. If the parties consulted are honorable men, the inventor may safely confide his ideas to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the MINING AND SCIENTIFIC PRESS. In all cases they may expect from us an honest opinion. For these consultations, opinion and advice, we make no charge. A pen-and-ink sketch, and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret, and strictly confidential.

PRELIMINARY EXAMINATIONS.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search, made at the U. S. Patent Office, Washington, through the medium of our house in that city, to ascertain whether among all the patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This search, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will in most cases be saved; if the invention has been in part patented the applicant will be enabled to modify his claims and expectations accordingly. Many other obvious advantages attend the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications for patents are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analogous device; or some other invention for a similar purpose, but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary Examination provide; it will, however, generally inform the applicant whether an improvement similar to his, and used for the same purpose has ever been patented or not in this country.

Parties desiring the Preliminary Examination are requested to remit the fee (\$10), and furnish us with a sketch and description of the invention.

CAVEATS.

A Caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for this service varies from fifteen to twenty dollars. The Government fee under the new law is reduced to ten dollars; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftentimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small.

To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

EXPENSE OF APPLYING FOR A PATENT, REJECTIONS, ETC.,

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Prussian, Spanish, and inventors of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. This only discrimination made is against subjects of governments that

discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the Attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is generally thirty dollars; but the charge is higher if unusual labor is involved. If the patent is granted no further agency expenses ensue. If the application is rejected we cause a thorough investigation to be made into the reasons presented by the Commissioner for refusing the patent. In making this examination, we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one—which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement.

No charge whatever will be made unless we succeed in procuring the grants of Letters Patent.

GENERAL REMARKS.—For the information of applicants, we would state that some agents are in the habit of charging for the preparation of the case, and having no further facilities, decline all investigation or prosecution when rejected. Others, also, having no facilities of their own, advise their clients to go to the expense of procuring official copies of the drawings and specifications of all the references. Again, others are in the habit of charging a high price at the outset, in which they include the cost of prosecuting the case, if by them deemed necessary. Under this system, if the patent issues, or is justly rejected, no further prosecution is needed; but the inventor has paid full price for a service not wanted and never rendered.

Our object in making the above statement is, not to reflect upon the manner in which other agents conduct their affairs, but simply to have our own method of doing business clearly understood.

The system adopted by us works well, gives general satisfaction, and presents to all applicants, rich or poor, an equal opportunity of having their patent cases prepared, conducted and prosecuted in the best manner, by experienced attorneys, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves, or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in hundreds of such cases. Our terms for such cases are very moderate.

MODELS, REMITTANCES, ETC.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted on it conspicuously.

Where the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely, J. Silversmith, Government House, Rooms 20 and 21, San Francisco. Prepay the expense, and send express receipt to us by mail.

Simultaneously with the model, the inventor should also send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express with the model, or by mail. The safest way to remit is by draft on San Francisco payable to our order. Always send a letter with the model, and also with the remittance, stating the name and address of the sender. We sometimes receive envelopes containing money, but without any name or explanation; models are also frequently sent us from equally unknown sources.

A full description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the reception of model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready we send them to the inventor by mail, for his examination, signature, and affidavit, with a letter of instruction, etc. Our fee for preparing the case is then due, and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued, the applicant will be notified to remit the last installment of the Government fee, namely twenty dollars.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless the invention is one of great complication; the business can as well be done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself, must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but in other cases, owing to delay on the part of officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

RETURN OF MODELS.

Under the new law, if the applicant's case has been rejected he is entitled to withdraw his model from the Patent Office.

This law applies also to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

DESIGNS, TRADE-MARKS, LABELS, ETC.

Under the new law patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, borders, fringes, all new designs for printing, weaving, or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings, and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso relievo, new dies, impressions, ornaments to be placed upon any article of manufacture, architectural work, etc. The terms for which these patents are granted varies according to the fee paid by the applicant, as follows:

Patent for 3 1/2 years\$10
" 7 " 15
" 14 " 30

No models are required. But duplicate drawings must be furnished, together with the usual specification, petition and affidavits, which, to render the patent of value, should be prepared with the utmost care.

Our facilities for the prompt preparation and securing of patents are of the most extensive character and our charges are very moderate.

INFRINGEMENTS.

The manufacture, sale, or use of a patented article, without consent of the owner of the patent, is an infringement and subjects the infringer, by injunction from the Court an arrest or prohibition from the employment of his machinery, shop, works, factory, and men in production of article.

In addition to injunction the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable, either collectively or individually.

Having access to all the patents, models, public records, drawings, and other documents pertaining to the Patent Office, we are prepared to make examinations and give opinions upon all infringement questions, advise as to the scope of ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Address all letters of inquiry to J. Silversmith, Government House, rooms 20 & 21, San Francisco.

APPEALS.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court, of the district of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No Jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision.

The party taking the appeal pays an additional fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the appellant to put in an answer, and a similar period to the appellant for a closing reply.

Many important cases are brought before the Judges on appeal, and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services can be retained on moderate terms.

INTERFERENCE.

If an inventor happens to apply for a patent when another application for a similar device is pending at the Patent Office, the two cases are declared by the Commissioner to interfere, and each party is notified to present evidence as to the date when he first invented the thing. He who proves the priority of the invention receives the patent, and the other applicant is rejected.

Even after the patent has been granted, another inventor may come forward and apply for a patent for the same device; and if he can prove priority of invention the Commissioner will issue a patent to him.

The taking of evidence in interference cases is a sort of private inquest. It is not necessarily a Court proceeding. Subpoenas can be issued and compulsory process employed to cause the parties to testify.

The management of interference is one of the most important in connection with Patent Office business.

Our terms for attention to interferences are moderate, and dependent upon the time required. Address all letters to J. Silversmith, Government House, San Francisco.

A POSITIVE FACT!

THERE is no Invention or Discovery on record that can boast of more Simplicity, Style, Beauty, or Labor Saving, than the Wonderful

SEWING MACHINES

—OF—

WHEELER & WILSON!

This machine is acknowledged by all those who use it to be that which it is represented to be,

A SIMPLE, DURABLE MACHINE,

Far Superior to any Other!

NOW MADE.

We, therefore, advise all those purchasing, (more especially Clothing Manufacturers,) to send for Circulars, and read the thousands of many high recommendations.

REDUCTION OF PRICES!

It is also the Cheapest that can be bought. These Machines are less liable to become out of order than the many others—are better finished, and are capable of doing more work.

The matter in N^o 2 and 3. is reprinted in
N^o 1. Vol. V. in this Book.

DEATH CAMASS.

Anticlea Fremontii.

BY DR. A. KRILLOGO.

WE give above an outline figure of what we take to be the "Death Camass" of the Indians. The name itself sufficiently indicates the fatal consequences of mistaking the roots of this plant for other harmless and edible bulbs, which it very much resembles (as, e. g., the *Brodiaea grandiflora*, or King's Spear, *Sewbertia laca* or Ithuriel Spear, *F. illirias* or the checkered lilies, and *Hesperiscordum*).

There appears to be still some uncertainty as to the precise plant entitled to this ominous Indian appellation. Dr. Torrey refers it to our plant, but Dr. Cooper, in the "Natural History of Washington Territory," refers it to the *Dichelostemma congesta* or the Wild Hyacinth, very common in this vicinity, as in most parts of California, Oregon and Washington Territory. Dr. Cooper asserts this purple hyacinth to be the true Poison Camass or the *Bah-Kah* of the Nisquallies.†

As the plant to which Dr. Torrey refers it, belongs to a known poisonous class, and the other does not; but all its associates are simply expectorant, or only mildly tonic, we think it fair to presume that Dr. C. must be mistaken.

This genus is named from *Anticlea*, the mother of Ulysses, who is said to have (poisoned?) killed herself when she heard a false report of her son's death. If allowed a conjecture in the madam's case, we think it very probable she took the *Hellebore* of the ancient witches. It would have been just like her!

Horses are stupefied and cattle killed by feeding on these plants in autumn.

As this plant differs from Kunth's characteristics of *Anticlea*, we shall notice it a little more minutely; e. g., the glands are not situated at the "base of the sepals," but above the claw (see P in figure); neither is the gland "two-lobed," but numerous and minutely toothed above. The filaments are not free from the base of the ovary, but are inserted at the junction of the sepals and ovary conjointly with both. The seeds also are not in "four-series," but in two series (see S in the figure, where one of the pods or cells is laid open); the seeds are not broad and compressed, etc., neither are the leaves "plain," but deeply and strongly channeled and keeled on the back and sheathing at the base.‡

The stem and root leaves spring from a tuiculated bulb (onion-like), growing from the size of a bullet to a pigeon's egg; the flowers as seen above are in a loose terminal raceme, or in rich soils, especially if cultivated, they become raceme-paucified, i. e., branching also into lateral racemes. Flowers, white or whitish, sometimes creamy-yellowish, consisting of six nerves and spreading petals, each of which has an orange-colored, honey-bearing cavity;

*Sometimes spelled "Kamass."

†Should any of our readers be in possession of actual or reliable knowledge on this subject, we should be glad to hear from them.—Ed.

‡Perhaps nearer the genus *Amianthum*, but this is not gland-bearing.

claw, greenish on the back, one-sixteenth to one-eighth of an inch long; filaments, flattened and about as broad as the claw at the dilated point of insertion, attenuated upwards about equal to the styles, or more than half as long as the petals—those opposite the inner narrower petals are shortest; anthers, yellow, obtuse above, two-lobed downwards, looking or turned downwards, affixed by the back (see O, showing the confluent opening when seen from without; see "in" an inside view.) The fruit consists of three pods, opening on the inner margins, which are slightly adherent in a somewhat triangular arrangement; seeds, oblong, roundish or sub-angled by contact.

The leaves are light, green, broadly grass-like, or linear-lanced, slightly roughened, six inches to a foot long, one-quarter to three-quarters of an inch wide, deeply channeled, the bract leaves among the flowers are oblong, attenuously pointed, with seven or more nerves and boat-shaped, margins membranous in cultivation, eared at the base.

If the petals are examined with care, at the base of each plait or groove is seen a little pore, running underneath the yellow nectar gland.

We have a Washoe species, with stamens longer than the flowers, which may prove to be new.

A KNITTING loom has lately been invented by J. B. Aiken, of Franklin, N. H. It has been invented but a year or two, yet there are now made on the loom more than two millions of dollars worth of knit goods annually in this country, and the introduction of the loom into Europe is meeting with marked success. A family knitting machine has recently been invented. It is no larger than a sewing machine, simple as a case knife, not liable to get out of order, can be operated by a child, will knit housespun yarn, and weave a handsome stocking. Its ordinary movement is at the speed of five thousand stitches in a minute. It can be driven at the interesting velocity of sixty thousand stitches a minute, and make perfect work.

SILVER.—Silver mines of greater or less extent and promise, are being discovered almost every day in different portions of the State. The *Union Democrat* (Sonora,) understands that rich mines of this ore have just been discovered in the mountains a short distance from Sonora, and that specimens taken therefrom indicate a richness equal to the famous Washoe leads. Silver ore has also been found near Two Mile Bar, Stanislaus river, said to be rich. Many claims have been staked off, and considerable excitement is manifested.

MINING IN ANADOK.—The *Ledger*, of April 13th, says: The quartz lode of George L. Gale, above Volcano, is paying very handsomely—to the tune of \$100 per ton of rock. The lode varies from one to three feet in thickness. The miners about Fiddletown appear to be successfully employed. The Cosumnes Ditch, owned by Purington & Co., has a fine supply of water, which meets with a ready sale by the numerous miners at work.

RICH DIORINGS.—New hill diggings, paying an ounce a day to the hand, have been struck on the North Fork of Feather River, near Mosquito Creek. It is said that the claims are of sufficient richness to pay \$50 a day to each hand, could the ground be easily worked, and mining facilities applied.

BODY RECOVERED.—The body of Hugh Gallagher, who was drowned in Dry Creek, Calaveras county, was recovered last week. He was a native of Alldrummond, Ireland, aged 23 years.

FELL IN A SHAFT.—On the 2d instant, Mr. Shircliff fell into a shaft near Volcano, a distance of sixty feet, and was but slightly injured.

Gold is seldom found in Nature in a pure state, and for the purposes of the arts is alloyed with a small quantity of either silver or copper, by which its hardness as well as its fusibility are considerably increased.

In this country the standard of the alloys of gold is calculated in fractions of unity expressed in carats. Unity is supposed to be divided into twenty-four carats, whilst the carat itself is subdivided into thirty-two thirty-secondths; so that unity may be considered as made up of 768 thirty-secondths of a carat. In this way the gold coinage of the United Kingdom is said to have a standard of twenty-two carats; or, in other words, a sovereign consists of an alloy in which, in every twenty-four parts, there are twenty-two parts of fine gold and two parts of alloy. It is for this reason that, for the assay of bullion, twelve grains of the substance are conveniently operated on, since every half grain of fine gold found by experiment will evidently correspond to one carat in the composition of the alloy. The various subdivisions of the carat are represented by fractions of a grain, and the true standard is thus strictly and readily determined. It is needless to remark that the greatest accuracy is required, both in making the various weighings, and also in the fusion and separation of the buttons. It is likewise advisable, in all cases, to make at least two separate experiments on every sample examined; and if these should not agree to within two or three-thousandths of a grain, other assays must be made, until the desired approximation has been obtained.

SPECIFIC GRAVITY.—The specific gravity of gold is a means of distinguishing that metal from other substances of nearly the same color. It is necessary that the meaning of the term specific gravity should be explained, as also the methods by which the specific gravities of bodies may be conveniently ascertained.

By the specific gravity or density of a substance is understood its weight, as compared with that of an equal bulk of some other body taken as a standard of calculation. In the case of solids and liquids, distilled water, at the temperature of sixty degrees Fahrenheit, is taken as this point of comparison; but the densities of the gases are usually estimated in relation with common air taken as unity.

In order to determine the specific gravity of a body, it is necessary to ascertain its weight when weighed in air, and also how much it loses in weight by immersion in water. If we call its weight in air W , and its weight when suspended in water, w , it is evident that $W-w$ will represent the weight of an equal volume of that liquid, as whenever a solid is placed in a liquid that covers the top of it, it must necessarily displace precisely its own bulk of the medium in which it is situated. The specific gravity of a body being, then, its weight in comparison with an equal bulk of some other body taken as unity, it will readily be obtained from the above data, and is nothing more than the relation existing between W and $W-w$, which will consequently be represented by $\frac{W}{W-w}$.

The most common method of taking specific gravities, when large pieces of the substance to be operated on can be readily procured, is by means of what is called the hydrostatic balance. This consists of an ordinary balance of which the pans are suspended by strings of unequal length. In order to obtain a density by this instrument, the substance to be operated on should be suspended by a hair or filament of silk to the shorter pan, which has a hook attached to its under side for that purpose. Weights should now be added in the other pan until the equilibrium is restored; and when this takes place the weight W will be noted as that of the substance in air. To obtain the corresponding weight of an equal bulk of water at the temperature of 60° Fahrenheit, a vessel of that liquid is now placed under the shorter pan in such a way that the suspended fragment of

which we desire to know the density may be completely immersed in it, and weights are to be removed from the other pan until the equilibrium be again restored. The second weight thus obtained w , deducted from W , ascertained by weighing the substance in air, gives the weight $W-w$ of an equal volume of water, and the required specific gravity $\frac{W}{W-w}$.

$W-w$ is at once obtained by dividing the weight in air by this difference. When it is required to conduct these operations with great accuracy, it is necessary to employ a very delicate substance, and to remove any air-bubbles that may attach themselves to the substance when placed in water, by means of a camel's hair brush. The temperature of the water in such cases should also be kept constantly at sixty degrees, and any deviation of the barometer from thirty inches should be duly allowed for. In cases where but small fragments of a substance can be obtained, the instrument called the specific gravity bottle is most conveniently employed. This is nothing more than a common bottle, of which the stopper, nicely fitted by grinding, is traversed by a capillary tube, and so arranged that it cannot sink beyond a line marked upon the neck of the vial. By this means it is easy to obtain a constant weight of water in the instrument, since, if it be filled beyond the line, and the stopper afterwards forced into it, the residual liquid will escape through the capillary tube, and the bottle remain exactly full. In order to take a specific gravity by the aid of this vial, it should first be weighed when full of water; a counterpoise equivalent to the weight of the bottle being placed in the opposite scale-pan. The substance to be examined must then be weighed in air, and afterwards dropped into the vial, care being taken to avoid the loss of the most minute particle. The stopper is now replaced, so that the bottle may again remain exactly full, and the whole is re-weighed. The difference between the weight of the bottle of water, W , added to the weight of the substance in air, W' or $W \times W'$; and that of the weight of the bottle of water, w , when containing the fragment to be examined, is evidently $W \times W-w$, and the specific gravity $\frac{W \times W'}{W \times W-w}$.

sought will, consequently, be expressed by $\frac{W \times W'}{W \times W-w}$.

The following example may probably render the above explanations more readily understood. I find that the bottle full of distilled water weighs 995.74 grains = W .

Another substance, which is supposed to be gold dust, weighs in air, 105.30 grains = W' . The unaltered weights of the substance and bottle of water together being 1101.04 grains = $W \times W'$, the weight of the equivalent volume of water displaced will be 1101.04 - 105.30 = 995.74 = $W \times W-w$. It consequently follows that the specific gravity of the substance is

$$\frac{105.30}{5.52} = 19.07 \quad \frac{W \times W'}{W \times W-w}$$

The above result shows, then, that the substance examined was really gold dust, and but little mixed with any kind of alloy.

Instead of operating as above described, the density of any finely-divided body, such as gold dust, may be determined by the following process: The substance is first weighed in air, and then placed in a specific gravity bottle, of known capacity, and the bottle carefully filled from a graduated pourer up to the point marked on its neck.

On consulting the pourer, every division of which may represent one grain of distilled water, it is at once seen how many grains of water have been required to fill the bottle, when containing the known weight of gold, up to the mark on its neck. On deducting this from the ascertained capacity of the bottle, the weight of the displaced water is at once seen. The weight of the substance in air is now to be divided by this result, and the specific gravity of the body is at once obtained.

The advantages of this method under circumstances in which distilled water cannot be obtained, is very obvious, as not only will any liquid not acting on the substance under examination answer for the experiment, but the results found are also perfectly independent of both temperature and pressure.

From the known specific gravity of gold, as well as that of the quartz rock with which it is commonly associated, it becomes easy, after determining the density of the mixture, to ascertain by calculation the relative amount of each present in any particular specimen.

To Find the Proportion of Gold in a Mixture of Gold and Quartz.

The specific gravity of the gold = 19.000

The specific gravity of the quartz = 2.600

These numbers can be corrected when experiment shows the specific gravities to be different.

A. Ascertain the specific gravity of the mixture of gold and quartz. Suppose it to be 8.067.

B. Deduct the specific gravity of the mixture from the specific gravity of the gold: the difference is the ratio of the quartz by volume:

$$19.000 - 8.067 = 10.933.$$

C. Deduct the specific gravity of the quartz from the specific gravity of the mixture: the difference is the ratio of the gold by volume:

$$8.067 - 2.600 = 5.467.$$

D. Add these ratios together, and proceed by the rule of proportion. The product is the per centage of gold by bulk:

$$10.933 \times 5.467 = 16.400$$

$$16.4 \text{ is to } 5.467 \text{ as } 100 \text{ is to } 33.35.$$

E. Multiply the per centage of gold by bulk by its specific gravity. The product is the ratio of the gold in the mixture, by weight:

$$33.35 \times 19.00 = 633.65.$$

F. Multiply the percentage of quartz by bulk, by its specific gravity. The product is the ratio of the quartz in the mixture by weight:

$$66.5 \times 2.60 = 173.29.$$

G. To find the per centage add these ratios together, and proceed by the rule of proportion:

$$633.65 \times 173.29 = 806.94.$$

$$806.94 \text{ is to } 633.65 \text{ as } 100 \text{ is to } 78.53.$$

Hence, a mixture of quartz and gold, having the specific gravity of 8.067 contains 78.53 per cent of gold by weight.

Mineralogical Occurrence and Geological Position of Silver.

BY J. D. WHITNEY, STATE GEOLOGIST.

MINERALOGICAL OCCURRENCE.—It is doubtful whether this metal occurs in nature in a native state. A few grayish-white metallic grains were detected by Herman in the gold-washings of the Ural, which proved, on examination, to be tin, alloyed with a little lead; but there is reason to doubt whether these may not have been of artificial origin. Certainly, if native tin does occur, it must be an extremely rare substance. Its ores, and the combinations in which it is found, are very few in number. Two only are worthy of notice; these are:

Cassiterite, or Tin-stone; an oxyd of tin, containing one atom of the metal and two of oxygen, or, in per centage, 78.62 of tin and 21.38 of oxygen. This is an ore which is destitute of a metallic appearance. Its color is usually a dark brown or black. It not unfrequently occurs finely crystallized in right square prisms; frequently in twin crystals, which sometimes weigh several pounds. The finest crystallizations are found in Cornwall and the Erzgebirge. Wood tin is a common form of this ore, and consists of botryoidal and reniform masses, having a radiated structure. This is the ore from which nearly the whole of the tin commerce is discovered.

Tin pyrites, Bell metal. A sulphuret of tin and copper, with a little iron and zinc. It is, when pure, of a steel-gray color, but has often the appearance of bronze; hence the name, bell-metal ore. This is a species of rare occurrence; its principal locality is Wheal Rock in Cornwall, and it is found, in small quantity, in the Saxon and Bohemian tin mines.

A few traces of tin have also been found in some of the ores of titanium and uranium; but, compared with the other metals in common use, it is a rare substance. Notwithstanding this, it was one of the best known and most used by the ancients, from the earliest historic times. Long before the art of reducing iron from its ores had been acquired, tin, alloyed with copper, forming bronze, was generally applied, by those nations which were most advanced in civilization, to the fabrication of utensils of household and warlike use; but, in most cases, the sources from which their ores were derived are no longer known.

At present, although tin mines are worked in several countries, two stanniferous districts may be said to supply the world with this metal, since the amount obtained from other sources is but trifling in comparison with what they furnish. The great tin-producing regions are Cornwall, in England, and the islands of the Malayan Archipelago, especially Banca.

GEOLOGICAL POSITION.—Tin, more than almost any other metal, has a peculiar and characteristic mode of occurrence. It is pre-eminently an old metal, since it is not found at all in the newer rocks. Neither does it occur disseminated through Nature, like silver, copper, or iron, or even arsenic, which are present almost everywhere, if not in quantity, at least in minute traces. Tin ore is confined almost exclusively to the azoic, metamorphic, palaeozoic and hypogene rocks. The latter is its characteristic position.

There are four forms in which the deposits of the ores of this metal present themselves: 1st. In flat sheets or beds lying between the laminae of the slate and granites, and parallel with them and each other; each deposit is usually quite limited in its dimensions, although frequently accompanied by similar ones at no great distance. Such sheets of ore are called in Cornwall *flats*, and when they consist of tin ore, tin *flats*, although this name is also given to deposits, to which the name of stockwerk would be more properly applied. They seem to be allied in character to contact deposits, or segregated masses, and pass into the next class, which is that most characteristic of the ores of this metal. 2d. The stockwerk, in which form of deposit the stanniferous mass is made up of an assemblage of veins of small size, in which the ore is mostly concentrated, and which ramify through the rock, which, itself, contains oxyd of tin disseminated through it in fine particles in the neighborhood of the veins. These evidently do not originate in fissures, although frequently approximately parallel with each other. Quartz almost invariably forms the principal gangue of the stanniferous veins, and the rock itself, in their vicinity, is usually more quartzose than elsewhere. 3d. The ores of tin are fre-

quently found in true fissure-veins; but they are generally believed, in such cases, not to continue to a great depth, being frequently replaced by copper and other metals. It is usually allowed, that where there are several sets of veins in the district, those which carry ores of tin are the oldest. 4th. Tin-stone is very extensively obtained from washings, or "stream works," as they are called in Cornwall, the ore being scattered through the superficial detritus, and separated from it by the same methods which are applied to gold and platinum. This is the character of the deposits of Banca and the Malayan Peninsula, which have been long worked, and have yielded extensively, no mining in the solid rock having been as yet practised in those regions.

The metalliferous substances which are chiefly obtained from washings, are necessarily such as are not liable to undergo decomposition when exposed to air and moisture. Gold, platinum, and the associated metals are of this character, and would remain forever unaltered, except from the action of mechanical causes. Oxide of tin possesses similar characters, being an ore which does not readily enter into new combinations with carbonic and other acids with which it is brought in contact in the superficial deposits. Almost all the other metallic ores, under the same circumstances, form various salts, some of which are soluble, and are washed away entirely, while others are earthy and pulverulent, and for this reason, and on account of their low specific gravity, could not be collected by washing, at least without great loss.

The vein-stones and minerals which are associated with the oxide of tin are remarkably constant in their nature, all over the world. They are wolfram, or tungstate of iron and manganese, apatite, topaz and mica; sulphuret of molybdena, native bismuth, and arsenical pyrites are also rarely wanting where tin is found. Tourmaline is another almost constant companion of this metal. Sometimes it forms a part of the veins themselves, but more usually it occurs disseminated through the rock adjacent to them. Where these minerals occur, veins of tin ore may be reasonably expected to be found.

Chloroform—Its Use and Utility.

THERE are so many theories, speculations and apprehensions in regard to chloroform, that I have thought, in consideration of your magnanimity and efforts to benefit the public, that perhaps the following articles might not be altogether uninteresting or unimportant to you and our people.

Chloroform is, of all others, the safest and most practical of any anæsthesia* that has as yet been discovered. Chloroform was first discovered by Mr. Samuel Guthrie, of Sackett's Harbor, N. Y., in 1831. He was the original discoverer of this wonderful and important agent. With regard to its combinations, there have been many deductions, additions, analyses, etc., by different scientific gentlemen in the medical world, since that date. The London, Edinburgh and Dublin colleges of pharmacy have also obtained and established certain compounds and equivalents of it for their formula and use; the pharmacies of the United States the same. The principal ingredients from which it is derived are unlacked and chlorinated lime, alcohol, peroxyd of manganese, sulphuric acid—some pharmacies add pyroxylic spirit.

The above are the principal articles constituting its basis before distillation. There are many impure articles of it in the market, made so by alcohol and sulphuric ether and often by sulphuric acid. Different tests have been made by the most eminent men of the age, of recent dates, by administering it to all kinds of animals around the house, in menageries, and in the Zoological Gardens of London, where animals of the most malignant ferocity are kept by the government and Queen.

As an internal and remedial agent, it has been found to be of the utmost importance, especially in cases of paroxysm, gastritis, hemorrhage, trismus, tetanus (locked-jaw). As a substitute in the place of ether, morphia, chlorodyne manipulations, or any other anæsthesia to impair pain, it has proved most opportune in our progressive age and successful in its official worth and position in the medical world. It is of the highest order among the class of such agents. In most cases of operative surgery, its value can scarcely be appreciated in capital operations, such as amputations, trepanning (opening the head), lithotomy (reducing stones in the bladder), lithotomy (extracting stones from the bladder), as well as in minor cases, where the knife, bistoury, screw and saw are used. Naval and military surgeons, as well as those in the extensive and rapidly increasing field of civilized life, are adopting it as absolutely necessary in their practice.

Thus, since 1832, at which date Professor Ives laid before the world his experiments, together with Dr. Simpson of Edinburgh, it has become one of the great adjuncts in all cases where pain is involved. Hence, in the great field of medicine, the following named gentlemen, of different continents, and well known in science, have given their hearty assent to its use: Professors Faraday, Liebig, Ives, Doctors

Mott, Trowbridge, Blair, Morton, Parmalee, Gregory, Parrish, Simpson, Delion, Aran, Legroux, Sigourney, and Professors Nott and Silliman, all coincide in its use. With the above authority, we may safely presume to give some practical details in relation to its administration in our practice. I have administered for a series of years almost consecutively, and in the outset I am, without any single reservation, confirmed in its use. If it is in properly qualified hands, I am willing to assert that it is safe to use it, not only in the hands of a physician, but with all intelligent people. Hence, at this date, April, 1861, in the great field of science, art and mechanism, it is rapidly coming into use. When it shall have been well understood—its benefits and use for disease and subduing pain—it will, I trust, not only find its way all over and through the medicinal and scholastic world, but also for those in the more humble walks of life.

Where occurrences have been made known, adverse to its use in the most of cases, the student will find that other causes had much to do with the occasion, and although the public may have become alarmed, yet, if all the secrets could be established before the people, chloroform would not have been invalidated in the public estimation. Already it occupies a high position among the different agents employed to allay pain, and I think ultimately it will take the precedent.

In my ensuing articles I will communicate through your very invaluable paper the mode, manner and constitutionality, of the patient—also the time when it can safely be used with impunity.

W. H. IRWIN, M. D.

Tunnels.

It is a known fact, sustained by the experience of the entire world wherever silver ores have been found, that the greater the depth from the surface the richer and larger the veins of the precious metal. Reasoning on this fact, the silver miners of Nevada Territory, with the ever practical turn of the American mind, soon determined that it was the proper course to attack the veins as far below the surface as possible. To work the mines at any great depth by means of shafts requires pumping engines to free the mines of water. They have started a series of tunnels which will tap the different veins at depths sufficient to allow the mines being worked for a number of years without using engines to free the mines of water or to elevate the ore to the surface, and effect a proper ventilation; thus saving a great annual consumption of fuel, a scarce article in Nevada Territory; also the great expense of the wear and tear of machinery.

There have of late been several long tunnels started, but by strange oversight of their projectors seemed to have overlooked Mount Ophir, the only hill which has been fully developed and of whose mineral wealth we have unmistakable proof, to wit: that of our eyes. This field was left open until the Latrobe Tunnel and Mining Company incorporated and astounded the inhabitants of Virginia, by starting a work unequalled in the history of the Pacific coast for its bold conception, thoroughly digested plans for all the minutiae of a work of the greatest magnitude, and the energy with which it is being worked.

Having, during the past week visited the tunnel of this company, although, judging from popular report, prepared to see something extra, we were surprised at the character of the work, all the details of which were explained by the superintendent, Mr. W. A. M. Van Bokkelen, who seems to be putting his best abilities as an engineer to their utmost tension to have this the great work of our new territory; and right well it is succeeding.

The tunnel is six feet two inches wide, and six feet six inches high in the clear, and is, as it progresses, prepared for a double railroad track, intended for two thirty inch cars. The timbers, which are square hewed, are framed on the plateau at the mouth of the tunnel and are not allowed to pass inspection (and from their appearance as they stand in their place, a most rigid one it is) until they fit with the exactness of cabinet work.

This tunnel, when it pierces the center of the mountain, will be at the great depth of 1683 feet from the surface, it being the deepest tunnel for miles around by over one hundred feet.

This company is under contract with every company on its line, whose claims it will interest, to develop their mines, and the company in return receive in payment a segregated interest on one side of their tunnel of from two to four hundred feet; thus those owning the rich claims in Mount Ophir are enabled, though poor, to have their claims properly developed without being compelled to sell out to capitalists, and the Tunnel Company, although receiving but a small price from each, in the aggregate receive a mine far superior in wealth to the Ophir Company's.

The following are the altitudes of the prominent points around our city, from actual survey, the summit of the Sugar Loaf being taken as the base, the level of which is midway between the mill of Messrs. Ozden & Wilson and the mouth of the tunnel of the Latrobe Company:

Mount Davidson summit.....	1960 feet.
Mount Ophir	1693 "
Cedar Hill	1157 "
Gould & Curry plateau and office.....	426 "
Ophir plateau and engine house.....	350 "
Ophir union tunnel.....	185 "
Wells, Fargo & Co.'s steps.....	268 "

—Territorial Enterprise.

To Explorers, Discoverers, Prospectors and Miners, on the Pacific Coast.

To furnish those who have not the advantage of a large library, with the substance of the researches of amient miners and metallurgists, and to explain many processes and technical terms and phrases which are frequently not understood.

To be a companion to the practical miner and metallurgist—an invaluable *vade mecum*. To enable the latter to extract, to assay, and to tell the properties of all the useful metals; and to acquaint the former with a knowledge of rocks and their order of superposition, by which great assistance in searching for the metals may be derived, and which will give him a clue to the rich depositories of mineral treasures.

An acquaintance with the general results, collected and classified by geology, must be our first guide in the investigation of mines. This enables the observer to judge whether any particular district should, from the nature and arrangement of its rocks, be susceptible of including within its bosom, beds of workable and valuable ores. It indicates also, to a certain degree, what substances may probably be met with in a given series of rocks, and what locality these substances will preferably effect. For want of a knowledge of these facts, many persons have gone blindly into researches equally absurd and ruinous; and an amount of money much greater than is generally known has thus been expended in vain.

To attempt anything without it, would be like sending a ship to sea without a helm to direct its course, without sails to catch the impelling breezes, and without a compass to guide its way. Formerly, indications of mines were taken from very unimportant circumstances, but geognostic observation has substituted more rational characters of metallic deposits. They may be called—

1. Negative indications, which are derived from that peculiar geological constitution, which, from experience, or general principles excludes certain metallic matters; *e. g.*, granite, and in general, every primitive formation, forbids the hope of ever finding within them combustible fossils, such as pit-coal, unless it be bed of anthracite; there, also, it would be vain to seek for common salt. Granite rocks very seldom include silver; or limestone, ores of tin. Volcanic territories never afford any metallic ores worth the working; nor do extensive veins usually run into secondary and alluvial formations. The richest ores of iron do not occur in secondary strata; and the ores of this metal, peculiar to these localities, do not exist among primary rocks.

2. Positive indications, which consist either in an efflorescence of the subjacent metallic masses: as magnetic attraction, for iron ores; bituminous stone or inflammable gas, for pit-coal; the frequent occurrence of fragments of particular ores; etc.; or, in the geological epoch and nature of the rocks. Marks of this kind acquire new importance, when, in a district susceptible of including deposits of workable ores, the vein-stones are met with which usually accompany any particular metal. The general aspect of mountains, whose flanks present gentle and continuous slopes, the frequency of sterile veins, the presence of metalliferous sands, the neighborhood of some known locality of no ore, as ironstone, in reference to coal; lastly the existence of salt springs and mineral waters, may furnish indications.

Classification of Rocks.—To understand the relation which geology bears to mining, and the way in which it can be made subservient to its promotion, it is necessary to glance at some of the revelations which the science has made in regard to the structure and present condition of our globe, and the order in which the materials are arranged.

When a rock is divided into layers by seams, it is said to be stratified or divided into strata—each of these layers is called a stratum. When one mass of rock is contained in another, it is said to be imbedded or to occur in a bed. The inclination or general direction of the strata is called the dip. This is an important point to ascertain. Formation is used to signify a mass of mineral substances formed by the same agent, under the same circumstances, and at the same time.

Suppose ourselves to have arrived upon a large and extensive plain, which skirts the base of an elevated mountainous district, and begin a perpendicular excavation into the earth, we shall pass through the different classes of rocks in the following order:

For nearly one hundred feet we shall pass through layers of loam, clay, sand, and fine gravel. This deposit, from an existing river, is denominated *alluvium*, which is the soil and earth which rests upon the rocks. Having penetrated this, we shall find ourselves upon the second formation, called drift or *diluvium*. This is composed of coarse sand or gravel, with fine sand, containing large rounded masses of rock called boulders. The third series of strata which we shall penetrate, is composed of layers of clay, sand, gravel, and marl, with occasional beds of quartz and limestone. They contain many petrifications, and are usually horizontal. They are called *tertiary*. After passing through these, we come to the secondary, composed for the most part of solid rock, mostly made up of sand, clay, and pebbles, cemented together. With these we find many remains of animals and plants, graywacke, limestone, sandstone, coal, lias, clay, marl, green sand and chalk. Below this are the primary rocks. They are destitute of organic remains, have a structure always crystalline, and are more highly inclined. Here occur granite, gneiss, mica slate, limestone, gypsum, talcose slate, hornblende slate, quartz rocks, and clay slate.

Veins.—These are seams, or tabular-shaped masses, that

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY APRIL 20, 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.
At Fifty CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

New Modes of Treating Silver Ores.

The Veatch Process.

WITH the introduction of every new industrial pursuit springs up necessities for improved machinery and modes of operating, calling into practical exercise the scientific knowledge, and stimulating the inventive talent of the day; thus, at the outset of placer mining in California, it became evident that more effectual appliances than the batea and the horn-spoon could be devised, wherefore these primitive utensils were soon superseded by the rocker, and this, again, by the long-tom, which in turn gave place to the sluice, and the sluice to the present still more efficient mode, by means of hydraulic pressure.

Those who were here at an early day well remember the numerous new fangled and often queer looking machines, that then made their appearance under the name of Patent Gold Washers, and some of which were useless and queer looking, having a capital capacity for saving the dirt but losing the gold; much loss attended the effort of introducing these various machines, and abundance of ridicule was visited upon their unfortunate owners and inventors; yet, as we have seen, great things come, after all, of these early trials. And the men who were then laughed at as crazy inventors, are now respected as public benefactors, through whose efforts the product of our mines has been more than quadrupled and the wealth of the State proportionably increased.

Just at the present time a new and perhaps a more mighty industrial pursuit, than even gold mining, is springing up in our midst. The business of seeking for and reducing silver ores is now engaging the attention of our people more than any other, therefore, everything tending to facilitate and secure economy in this important pursuit possesses a special interest to the public. It is well known that different parties, both in this city and elsewhere, have been experimenting of late, with a view of devising some new process, or so projecting the old ones, as to encompass this object. The success of those endeavors has, from time to time, been announced as certain, and so perhaps it was, in more than one instance, on a small scale. How many, however, have accomplished their aim on an extended scale, remains to be proved. That this merit may be accorded to one party, at least, we now have pretty conclusive evidence. A party who has been through all the mills at Virginia City, carefully examining the various modes of reducing silver ores in use there, writes us that the process of Dr. Veatch, now employed by the Central Company, is more than fulfilling the expectations of the inventor, and entirely satisfying the company.

The "Veatch process" consists in submitting the argenteiferous ore, previously chloridised, to the action of a peculiarly constructed amalgamating machine, the details of which are not yet made public. The object of this machine is to reduce the chlorid of silver to metal, and then to amalgamate it without the usual loss of quicksilver. The great drawback heretofore in the treating of silver chlorid has been the length of time required, and the chemical destruction of the quicksilver, by its change into calomel. The new process obviates both these serious difficulties. The time required for amalgamation is about one-tenth that of the Freiberg method, and the calomel formed is immediately reconverted into metallic quicksilver. The only loss of mercury, therefore, is restricted to the particles carried away in the washing out at the close of the treatment. When the chloridising is carefully performed the loss of silver is merely nominal, much less than by the old method.

The superiority claimed for the Veatch Process is the cheapness of the machinery, the promptness and efficiency of its action, and its adaptability to any climate and season. Our informant assures us that at the written report of the Central Company states that the ores reduced in their mill by this method, have worked to within nine per cent of the fire assays, some extra good rock even going above them; the average, however, gives a result of ninety-one per cent of the fire assays, a fact of the utmost importance in connection with this branch of industry, and one that would seem to establish this as the mode which, of all others, must come into general use.

We shall, at an early day, present a highly scientific mining utensil, entitled the Eureka Gold Separator, imported by the enterprising firm of Messrs. Hawley & Co., corner of Battery and California streets. Also, the Buckeye Mowing Machine, of which they have the agency—no less important to agriculturists.

The History of Geology.

It is only within the last seventy years that sufficient facts have been collected to make any very considerable advance in respect to the causes of geological change. Prior to this time much speculation and fanciful theory was often manifested by philosophic minds upon the subject, clothed with deep thought and great ingenuity, but generally of such an extravagant nature, although in some respects true, yet, horn only to be blasted by the bitter pangs of contempt and ridicule. The progress of this science being based upon a correct knowledge of the other sciences, chemistry, botany and zoology, and these not having been classically understood in early times, it is not at all surprising that the views entertained by the great minds of the age were often speculative, crude and fanciful.

The history of the early theories of the earth, and views entertained concerning its changes and general features, is, in many respects, highly amusing, and often quite instructive, as illustrative of the mighty struggle of the human mind in search of truth. One of the most prominent opinions among the ancient Grecian philosophers, and one which constituted the principal cosmogony was, that the earth had been subject to several successive destructions and renovations, produced by aqueous and igneous agencies, with exceeding long intervals, varying from 100,000 to 300,000 years. In fact, we find that Pythagoras, Strabo and others, entertained very many quite correct views in regard to geological changes, which were then as plainly observable as at the present time, such as the formation of deltas by alluvial deposits, changes of the sea into dry land, and *vice versa*, the formation of islands by oceanic currents, etc. Strabo, the renowned geographer, explained the manner in which fossil marine shells were brought to assume their position upon the dry land, in a manner not unlike the views of modern geologists, and certainly most highly creditable to the age in which he lived. He supposed them to have been originally deposited in quiet waters at the bottom of the ocean, and subsequently elevated by earthquakes or volcanic power, an opinion long since received and entertained by scientific minds of the present age.

During the early part of the sixteenth century, considerable excitement sprang up in Italy among Christian people relative to geological facts, which began to attract considerable attention, such as the existence of organic remains, whether they ever belonged to living animals and plants; and if so, whether their petrification and situation could be explained by the Noachian deluge. These perplexing questions were agitated and discussed by inquiring minds for nearly three hundred years. Mattioli regarded organic remains as produced by a certain "fatty matter," fermented by heat, while Fall pie, Professor of Anatomy, supposed that they acquired their form by a kind of terrestrial exhalation, supposed that their peculiar configuration was produced by an influence of the heavenly bodies. Olivi regarded them as mere sparks or breaks of nature. A Professor of Anatomy, at Basil, in the year 1517, referred the bones of an elephant, found at Lucerne, to a giant of enormous dimensions, and in England similar bones were regarded as those of fallen angels! About the middle of the eighth century, the science began to advance more rapidly, yet it was most zealously maintained by those who were tenacious to the Mosaic history, that all organic remains were produced by the deluge of Noah, and they regarded a denial of such facts as equivalent to a denial of the whole Bible. This, no doubt, tended very much to retard its healthy progress, and, also, from the fact that most of the early writers, upon the subject, both in Europe and this country, were superstitiously inclined to connect geology with theology.

In 1749, Buffon, a French naturalist, published a work of considerable merit, upon the formation of the earth, and subsequent changes which gave great offense to the faculty of the theological school at Paris, and like Galileo, he was compelled to retract his opinions, which are now widely adopted, with no suspicion as conflicting with the Scriptures. His views were somewhat similar to those formerly advanced by Leibnitz, being based upon what is now known among geologists as the igneous theory.

While the science of geology was yet weak and tottering in its infancy, and though the great mass of talent and lore of theological schools were arrayed against its progress, yet, there were to be found some great and generous minds, both in Europe and this country, minds that were not to be biased by superstitious awe, nor controlled by the delusive wiles of ignorance and priestly rule. By the constant efforts of these noble and magnanimous souls, God bless them, the science of geology advanced, until, despite the mighty power of theological dogmas, its truths became established as a fixed fact, past refutation by all sensible observing minds. Here, again, was a dilemma; the theological world were in a state of ferment; they began to see that truth must prevail; that science was bound to claim its precedent. Observation and research were constantly developing facts and conditions, which were positive, tangible and convincing, until the learned doctors were compelled to abandon their long mis-conceived opinions and attempt a harmony of revelation with this beautiful science.

Within the past few years several very able works have been published by Drs. John, Pye, Smith and others, harmonizing to some extent, at least so far as practicable, geology with revelations, which have tended very materially to remove those false superstitious prejudices formerly entertained; and while we reflect upon the past history and pro-

gress of this most beautiful of all sciences, its appropriateness to the vast resources of wealth, as adapted to the economical purposes of man, the remote history of hygone ages opened ever to our view, the pleasure it affords us in tracing the connection between living animals and plants, with those in a fossil state, we are led to the conclusion that *facts*, and *facts only*, is the mighty fulcrum of the human mind, the basis of all scientific progress. J. G. H.

DICKERSON'S PATENT WIND POWER.

We republish to-day an excellent illustration of the Dickerson Windmill. Its general renown in this State is so well established that we need not add further comments. Messrs. Norcross & Co. have now the State right to manufacture them, and have established themselves at 124 Davis street, in this city, where they are extensively engaged in filling the many orders from our citizens and agriculturists. Though many styles are daily presented, yet we doubt whether anything superior can be invented.

Engineers' Association.

From some cause the attendance of the Engineers was but slimly represented on last Tuesday evening, which may however be attributed to the short time allowed to fully notify all those residing in the city. We would urge those, however, who have their profession at heart, to present themselves on Tuesday, April 30th, at 7½ o'clock P. M., at the office of this journal. The object of such an association is of too great an importance to be lost sight of, especially when we take into consideration the immense benefits that must accrue to them in scientific interviews, establishing a library of scientific works, and, most important of all, establishing rules and regulations as a guide for their positions and situations as employers or operators. An association of this nature has long since been required in this State; one that will tend to eradicate an evil which has heretofore proved destructive to life and property—i. e. placing incompetent persons in charge of engines, who, by ignorance and neglect, have been the cause of much mischief. Associations exist elsewhere—in Europe as well as in the Atlantic States—whose precedent should serve as a model for engineers on the Pacific coast. Our interviews with several of the engineers in the United States Navy, all coincide with us that such an association would be immediately expedient and praiseworthy, and in which the public would take an interest and aid their country by its beneficent designs. A full attendance is anticipated on the day set apart for the meeting.

To Applicants for Patents.

We wish to call the attention of those desirous of obtaining patents to the necessity of furnishing a model of their invention; or, if a chemical production, samples of the ingredients of which the composition is composed, for the Patent Office. It is also requisite that these should be carefully packed, with the inventor's name marked on them. They can be forwarded by express, and the government fee and charges should in all cases be prepaid, by draft or otherwise. Parties desirous of taking out a patent would do well to apply to the proprietor of this paper, either personally or by correspondence, as he has every facility at Washington, together with great experience in this line of business.

WILLARD'S PATENT VERMONT COMBINED REAPER AND MOWER.

THE agriculturists of this coast will be gratified to learn that the above illustration of the Vermont Combined Reaper and Mower, and of which a number have been received by Messrs. KNAPP, BURRELL & Co., 310 Washington street, in this city, is one enucleated to save a deal of labor, expense and time. In our estimation, this invention, with its many interesting and practical improvements, is now the most perfect machine, both for reaping and mowing, extant. We are informed by those who use it that it is the most important farming utensil, and laud it most particularly for its simplicity and durability. There are at present manufactured two different sizes and styles of Reapers and Mowers, each being provided with a double set of cutters or sickles. Elsewhere, in this issue, will be seen an illustration of a smaller size. Its advantages and excellence over other similar machines may be summed up as follows:

Having the cutter-bar hinged to the frame, so as to adjust itself to uneven surfaces; having two driving wheels, if one slips the other does the work; when the machine moves to the right or left, the knives are kept in constant motion by one or other of the wheels; it can be oiled, thrown in or out of gear without the driver leaving his seat: the whole weight of the machine is on the wheels where it is required to give power and stroke to the knives; when the machine is backed, the knives cease to play, consequently you back away from obstructions without danger of breaking the knives; the cutter-bar being hinged to the machine, can be packed up without removing bolt or screw; the machine is easily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart; it is mostly of iron, simple in construction, and a boy can manage it easily; it has no side draft.

SAN JOSE RAILROAD.—The *Mercury* says that in all probability work will be commenced on the San Francisco and San José Railroad within a few weeks from this date. The question is to be submitted to the people on the 29th of April, whether they will authorize the Board of Supervisors to subscribe to the stock of the road. If decided in favor of the proposition, work will be commenced immediately after the result is declared. Judge Dame, Secretary of the company, visited San José a few days since, and addressed the citizens on the subject.

CALIFORNIA AND PACIFIC RAILROAD.—The *Union* understands that the enterprise of building the California and Pacific Railroad may now be considered a fixed fact. The stock has been taken in Placer and Nevada counties, and in Sacramento. The proposed line is to be from the latter city to the State line east of the Sierra Nevada, via Dutch Flat and the Truckee Pass.

A DISCOVERY OF MARBLE.—The *Columbia Times* says that a citizen of that place had discovered an extensive marble quarry near Gold Hill, Tuolumne county. Several immense blocks of pure and fine statuary marble have already been taken from it.

NEW MINING COMPANY.—The *Osceola Gold and Silver Mining Company* this morning filed a certificate of incorporation in the County Court. Capital, \$160,000, in shares of \$100 each. Joseph A. Watkins, D. H. Russell and Henry A. Burrows, Trustees.

WASHOE IRON.—The *Silver Age* says a furnace and machine shop would prove a paying concern in Nevada Territory. There are mountains of iron and mountains of tariff for the protection of the iron interest.

The Geological Survey.

THE Legislative Committee on Mines have made a report giving an estimate of the expense of an examination of the botany, zoology, and paleontology of the State, the particulars of which are as follows:

Salary of Geologist in chief.....	\$6,000
Two Assistants, each \$2,400.....	4,800
Four Sub-Assistants, averaging \$1,500.....	6,000
Four Cooks, Mule-Drivers.....	2,400
Traveling and Field Expenses.....	3,600
Rent of Laboratory, Gas, Fuel, etc.....	1,200
Additions to outfit, instruments, sundries, and photographing specimens.....	1,000
Total.....	\$25,000

The Committee say:

The survey will be so organized that there shall be one party in the field, which can be subdivided into sections if desirable. The laboratory and office-work shall also be kept up through the year without intermission. The Geologist in chief will devote about half his time to the field-work, and the other half to the superintendence of the laboratory, and preparation of maps, reports, etc.

There will be two principal assistants of the departments of botany and agricultural chemistry (Professor W. H. Brewer), the other not yet appointed, in charge of that of zoology and paleontology.

There should be also four sub-assistants—one in the laboratory, one as taxidermist and collector, attached to the zoological department, another as assistant in the astronomical and topographical department, and a fourth as meteorological observer, who shall also act as clerk and general assistant. Four men are needed as cooks, mule-drivers, etc.

The benefits resulting from a Geological Survey of the Agricultural Chemistry and Botany of this State, cannot be too highly estimated, and it is desirable that the Legislature should take this matter in hand, and make an appropriation sufficient to prosecute the work with vigor and dispatch. From the above estimate it will be perceived that the amount required is very small in proportion to the immense benefit to be derived from the undertaking, and we trust the Legislature will lose no time in making the necessary appropriation.

We perceive that the *Alta* strongly objects to this measure on the score of economy, and estimates that \$15,000 would be sufficient for the purpose; but we are at a loss to perceive how this ridiculously small sum could be employed in accomplishing so important an undertaking. We are no advocates of extravagant expenditures, but in such an important measure as this, it would be true economy to spend five times this amount, in view of the vast interests concerned and the great benefits to be derived from such an undertaking.

CEMENT CRUSHING.—It has been discovered, near Placerville, that hard clay or cement can be profitably crushed, very much after the fashion of quartz. The cement mill resembles, but is not entirely like that designed for quartz. The stamps are lighter, and the batteries, instead of discharging the crushed earth on one side, discharge it on both sides, thus doing double the work, in the same time that it could be done by the ordinary quartz mill. There is a fine opening for such a cement mill at Spring Creek, near Columbia Hill. A rich field of cement is there. The cost of an entire cement mill, ready for running, according to the *Central Californian*, is \$3,500.

Deutscher Naturwissenschaftlicher Verein.

(GERMAN SCIENTIFIC CLUB).

WEDNESDAY EVENING, April, 17th. }
Society's Hall, Clay street, over the Merchants' Exchange. }
A better attendance of the members graced the meeting than at the past three assemblages. Dr. Eckel called the meeting to order; present, Dr. Lanzweert, Schmidt, Silversmith, Behrens, Gerberding, Hiller, George, Tillmann, Jordan, Wolleb, Jacoby, Kruse, and visitors. The minutes of the last meeting having been read and adopted, Mr. Mendheim asked through a communication, to have his name erased as a member of the Association, which request was unanimously granted. The resolution that five members of the Board of Management shall constitute a quorum, was adopted. As honorary members of this Association, were elected by acclamation, the following literary and scientific professors:

Prof. C. Vogt, Canton Genf, Switzerland.
Prof. G. Ehrenberg, Berlin, Prussia.
Prof. Koellicker, Wurzburg, Bavaria.
Prof. Uhle, Prof. Mueller Halle, Saxony.

Dr. Lanzweert presented a rich specimen of ore containing gold, silver, iron, bismuth, &c., found in Tuolumne county, California. J. A. Bauer donated a large Brazil nut; Mr. Schmidt a garter snake. Dr. Eckel received the thanks of the Society for the loan of a splendid collection of useful books. Some benevolent but anonymous member kindly presented a book-case, for which a vote of thanks was tendered. An interesting discussion was opened by Drs. Eckel and Lanzweert, on the bites of rattlesnakes. The latter gentleman announced that he would at an early day publish some facts with reference thereto; also, giving infallible remedies discovered by him. At a late hour the Society adjourned.

California Academy of Sciences.

MONDAY, April 15th, 1861.

THE Association being called to order, upon motion Dr. Veatch was invited to preside. Present, Drs. Trask (Secretary), Kellogg, Eckel, Messrs. Boynton, Dunn and Silversmith. The following applicants were elected as members of the Association: Rev. Dr. W. Scott, H. T. Stivers, Esq., and Henry Payot, Esq. Dr. Eckel kindly presented the Institute with a beautiful illustrated work, recently published, entitled, "Travels in the regions of the Upper and Lower Amoor;" by T. W. Atkinson. Dr. Kellogg described the Death Camass, (sometimes written "Kamass," of the Indians, of which an elaborate illustration and definition appears on the first page of the *PRESS*. He also gave notice that he will read a paper on the new species of an Onion discovered at Washoe.

The Editor of the *MINING AND SCIENTIFIC PRESS* donated the Society bound volumes of the above paper.

There being no further matters for action, the meeting adjourned.

Eminent Arrival.

WE notice, among the late arrivals in our city, that of Dr. L. C. Lane, formerly of the surgical corps of the U. S. Navy, who visits San Francisco with the design of making it the sphere of his future professional labor.

From the high position given Dr. Lane, at the period of his entry into the service, viz., the first place among a long list of candidates, who were examined for admission into the navy, in 1856, we regard him as an important addition to the medical profession of San Francisco.

For more than a year since he has been abroad in Europe, visiting the hospitals of France and Germany, and extending his acquaintance with certain of the branches of medicine, especially Analytical Chemistry. For the purpose of acquiring a practical knowledge of this subject, he visited the university of Göttingen, and spent several months in the laboratory connected with that institution, paying especial attention to the analysis of all the component parts of the human body, both in health and disease, as well as to the methods to be employed to show the presence of poisons.

Besides the prestige which his former connection with the navy must give him, inasmuch as admission into the surgical corps depends entirely on merit, his practical acquaintance with the German, French and Spanish languages must serve as a strong recommendation and ready induction into business with the foreign population of our city.

Corner of Sacramento and Leidesdorff sts.

almost always traverse the direction of the strata, and are composed of materials that differ from those of the rocks which they intersect. They vary much in their magnitude, yet the length and depth always bear a certain proportion to each other, and the breadth to the length and depth. The length and depth are frequently nearly alike. Few metalliferous veins reach above 1800 feet in depth, or 1200 feet below the surface of the mountains in which they are situated. In general, veins continue in one direction, and are usually much inclined, always more so than beds. The metallic matter called ore rarely occupies the whole of the vein, but is disseminated through the quartz, sulphate of baryta, wacke, granite, etc., which constitutes the greater part of the vein, and is called the gangue, matrix, or veinstone.

Metallic veins are most numerous in primary and secondary rocks. They occur more frequently in flat hilly country than in steep mountainous country, and generally on the ridges of the hills. Beds, on the contrary, are more abundant in steep and mountainous country. As a general fact the veins are seldom rich near the surface; but increase in value at a medium depth, and grow poor again at a greater. They are most productive near the junction of stratified and unstratified rocks. Their productiveness also depends on their direction somewhat; an east and west direction being regarded in some mines as the most favorable, while the north and south veins are usually unproductive. Great metalliferous veins usually run parallel with the general direction of great valleys.

[To be continued.]

FOSSIL PLANTS.—The great size of many fossil plants, and the vast accumulation of carbonaceous matter found in the coal formations, render it quite probable that the vegetation, during the early periods of earth, was far more prolific than at the present time. Yet, as the trees and shrubbery were mostly of the fern species, destitute of flowers, and unenlivened by the presence of vertebral animals, the landscape must have presented a very uniform and solemn, though imposing appearance—better suited to a state of preparation for the higher order of animal life, than for their real existence; better adapted to prepare fuel for man than for his happy abode.

The foreign journals report that continual progress is making in photography. An artist in France, it is said, produces effects, that so closely resemble engraving as scarcely to be distinguished from it. An impression is made on a sheet of some glutinous preparation; from this an electrotype copperplate is taken, and from this the picture is printed directly. In London there is an exhibition containing some six hundred specimens of photographic skill in marine views, insatiable subjects, where the flashing waves are arrested just as the foaming crest turns to fall.

ANOTHER PAINFUL ACCIDENT.—Thomas McGrath was working in Wood & Beattie's quartz ledge, at the Buttes, blasting out rock. On Monday a charge went off before its time, and took him full in the face. His hands are so crippled as not to be used at all. His face seems to have been blown full of powder, and when he was brought down he was entirely blinded. McGrath had been blown up before, and severely hurt. He is getting used to it; but still doesn't like the process.—*Sierra Citizen.*

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Central, \$800 per foot.
Ophir, \$1000 per share.
Gould & Curry, \$275 per foot.
Chollar, \$20 per foot.
Lucerne, \$50 per foot.
St. Louis, \$20 per foot.
Mount Davidson, \$50 per share.
Mark Antony, \$15 per foot.
Louise, \$16 per share.
Bradley, \$8 per foot.
Maston, \$5 per foot.
Lacy \$5 per foot.
Sacramento, \$5.
Shelton & Co., \$8 per foot.
Josephine, Flowery, \$10.
West Branch, Flowery, \$10.
Harrison, Flowery, \$6.
Yellow Jacket, \$50.
Exchange, \$20.
Monte Cristo, \$6.
Home Ticket, \$5.
Silver Monnd, \$40.
Sunshine, \$25.
Hard-Up, \$12.

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.
Transactions limited.

[Having completed all the requisite arrangements, we shall in future be able to lay before our readers a reliable list of prices of mining stocks of California and Utah.]

ESMERALDA.—A correspondent of the *Union*, writing from Aurora, in the above district, April 4th, says he expects to remain there for months, being satisfied that the place will prove to be the richest mining country ever discovered. He advises his friends to go and see for themselves.

With the extraordinary demand for all kinds of machinery in this Territory, why would not a furnace and machine shop be a paying institution in Nevada? We have mountains of iron, and mountains of tariff for the protection of the iron interest.—*Silver Age.*

TEETH! TEETH! Extracting without Pain! Dr. W. H. Irwin, Dentist, Third street, near Howard (opposite Estill's Mansion). All branches of Dentistry performed in the neatest manner.

Extracting, each, \$1.
Extracting children's teeth, 50 cents.
Filling with gold, each, \$1 \$2 and \$3.
Filling with platinum cement, \$1, \$2 and \$3.
Cleaning, whitening and burnishing, \$2, \$3 and \$5.
Straightening, etc., from \$2 to \$5.
Nervous and toothache cured, \$1.
Whole or partial sets, nicely and firmly adjusted on the finest gold, a from (each tooth) \$5 to \$10.
On the best silver plate (each tooth) \$3 to \$5.
Montgomery street Omnibuses pass the office every five minutes. Special attention paid to Children's Teeth. Circulars, giving full directions to parents for the preservation of Children's Teeth. Remember the place—Third street, near Howard.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our heretofore extensive establishment, we can confidently announce to the public that we now have

The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp Shoes and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanscomb's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screws, of every degree of fineness, made of the best Russia Iron, Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Smut Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF— BRYAN'S IMPROVED MILL.

This Mill will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

IMPROVED VULCANIZED
GUTTA-PERCHA BELT.

We are now prepared to furnish to Machinists, Engineers, Millers and others, the above article of Machine Belting,

which has been proved to be far superior to any other kind in use, being ENTIRELY FREE from the undesirable qualities of both Leather and Rubber. While possessing the good qualities of both,

IT DOES NOT STRETCH,

it is not affected by OIL, HEAT OR STEAM; and in fact, is well nigh PERFECT, as all who have used it attest.

Besides all this, the fact that

It Costs Less

than either Leather or Rubber, which makes it supersede them altogether as soon as its merits are known.

We have also produced an article of

HYDRAULIC MINING HOSE,

which is offered to miners as SUPERIOR to any other article heretofore used for this purpose. It is made to

Stand Any Pressure Required,

Will WEAR LONGER than any other article; will not Mildew or Rot; costs a moderate price, and is altogether

THE BEST AND MOST ECONOMICAL HOSE

ever used in California. It is made four and a half to eight inches in diameter, of different thickness, and stretch to stand pressure of from 60 to 200 feet perpendicular fall.

Catalogues and Price Lists sent on application to

CHARLES P. DANIELL & CO.,

Sole Agent for Pacific Coast,

41 California street, San Francisco.

ja24

A. KOHLER,

NO. 178 WASHINGTON STREET, SAN FRANCISCO.

Forty Cases of Musical Instruments Just Received,

Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS.

Also, TAMBOURINES, BANJOS, FIFES, FLUTES, CLARION PICALOES, VIOLIN BOWS, BOW-HAIR, ROSIN BRIDGES, PEGS, TAIL PIECES, FINGER BOARDS, TUNING FORKS, SSS ROMAN STRINGS (four lengths and four thread), and

ALL KINDS OF MUSICAL INSTRUMENTS.

Fresh every two months from Italy.

All of these goods will be sold to the trade, as they are direct importations from the manufacturers of Europe, and imported in large quantities by A. Kohler. He will sell them TWENTY PER CENT. CHEAPER than any other house in California; therefore it would be the interest of all to call and examine before purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by the case.

The wholesale department of this House is on Sansome street, occupying the whole block from Clay to Commercial street.

ANOTHER PREMIUM AWARDED TO THOMAS DONOLLY, AT the Alameda County Fair, held in June, 1860, for the best-manufactured CALIFORNIA YEAST POWDERS.

Read the report of the Committee, which is a sufficient guarantee for the superior quality of T. Donolly's California Manufactured Yeast Powders, and which are now admitted to be superior to any now in use in California or elsewhere. The following is the report of the Committee:

"We would notice as worthy of patronage the very superior Yeast Powders on exhibition by T. Donolly, having tested them, and found them much better than those imported."

Mrs. J. B. Weller, Mrs. C. M. Wentworth,

Mrs. S. E. Ahlen, Mrs. F. K. Shattuck,

Mrs. Dr. Newcomb.

The above decision is a satisfactory guarantee of the superior quality of T. Donolly's Genuine California Premium Yeast Powders.

People of California! encourage home manufacture, and in the one article of Yeast Powders, you will benefit the State several thousand dollars a year that are taken away for an imported article that cannot compete with your own manufacture.

Try Donolly's Yeast powders, and you will find them superior to any. One genuine unless labeled on the top of every can, and dated, 1860. Manufactory, 35 Front street, San Francisco. All orders will meet with prompt attention.

COUGHS, COLDS, CONSUMPTION,

NEWELL'S
PULMONARY
SYRUP.WHOOPING COUGH, BRONCHITIS,
ASTHMA, SORE THROAT,
ETC., ETC.,

Are complaints peculiar to no place, climate, class or condition of men. They are the common, every-day complaints all over the world. Would you be free from them and their fatal consequences? Try NEWELL'S PULMONARY SYRUP. No article of the kind ever offered to the public has met with such universal approbation.

Keep a bottle of it in your house, and when you feel that you have taken a slight cold, use it at once. Delays are proverbially dangerous, even in business affairs, and when exercised in relation to health, produce the most unfavorable results. No wise man would delay, for a single moment, to extinguish the spark that threatened to consume his house or his goods. Is the body and its condition less valuable than goods and chattels?

Try the Pulmonary Syrup, and I am sure of your most favorable testimony to add to that of all those who have already done so. Sold by the Druggists generally. Manufactured and for sale by
WM. NEWELL,

Prospectus

OF THE

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC
PAPER ON THIS CONTINENT.

SECOND YEAR!

VOLUME III.—NEW SERIES!

A new number of this extensively circulated paper commenced March 30 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers! This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.
Ten Copies for Six Months, \$16.
Ten Copies for Twelve Months, \$30.
Fifteen Copies for Twelve Months, \$44.
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 50. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

Rooms 20 and 21, Government House, Corner of Washington and Sansome streets, San Francisco.

BOUND FILES OF THE "MINING AND SCIENTIFIC PRESS."

We are now prepared to furnish clubs, societies, associations and others, with bound files of the Press—the only mining and scientific journal on this side of the Pacific, containing all the inventions and discoveries for the past year in two volumes, neatly bound and will be furnished at ten dollars for the two volumes, by mail or express.

NEW ENGLAND HOUSE,

HEYNE MANN, PICK & CO.

311 and 313 California street,

WAREHOUSE OF THE SAN FRANCISCO

POINER WOOLEN FACTORY,

Have Constantly on Hand

A FULL ASSORTMENT OF WHITE, BLUE, GREEN AND SCARLET,
2½, 3 and 4 point Blankets.

—ALSO—

Superior All-Wool Family Blankets.

—ALSO—

Since Blankets, especially adapted for Quartz Mining. This article has met with general approbation, and Quartz Mills in general will do well to give it a trial.

Having made great improvements in the works of the Factory, including new steam engines, etc., special attention will be paid to the execution of all orders.

Steamers and Hotels can be supplied with Blankets at the shortest notice. Buyers will please examine the California make, the superiority of which over imported Blankets is generally admitted.

All business connected with the Factory is transacted exclusively at their office—no other party being connected with it.
ap19

GOVERNMENT HOUSE.

ONE OF THE BEST BUILT, MOST COMMODIOUS AND JUDICIOUSLY ARRANGED HOUSES
in this city is the

GOVERNMENT HOUSE,

Located on the

Northwest corner of Sansome and Washington streets.

The building is new, has been recently repapered, varnished and painted throughout, is furnished in the best style; it is centrally and favorably located, being within easy access of the boats, places of public entertainment, and in the business heart of the city, and is admirably constructed with a view to the comfort and convenience of families.

For further particulars, apply at the office, ROOM NO. 5, first floor.
ap19

HUNT'S

IMPROVED FIRST PREMIUM
WINDMILLS!

AN ASSORTMENT KEPT CONSTANTLY ON HAND AT THE MANUFACTORY,

Nos. 30 Second street, 208 & 201 Jessie street,

SAN FRANCISCO

THIS WINDMILL WAS AWARDED THE FIRST PREMIUM AT THE MECHANICS' FAIR OF 1860, in San Francisco, for its great simplicity, strength and durability. It is easily controlled, and will be sold cheaper than any other Mill built. Further particulars in circulars.

The following committee awards the above premium: Devoe, Garratt & Ware: all of this city.

PRICES.—Eight feet wheel, \$50; Ten feet wheel, \$75; Twelve feet wheel \$100 to \$125
ap19 E. O. HUNT, Builder.

METALLURGICAL WORKS

For the Extraction of Gold from Sulphurets and Quartz Tailings.—A Mining Engineer, thoroughly acquainted with this business, practically and theoretically, offers his services to a responsible party with the necessary CASH, for the construction and superintendence of works of this nature. Further particulars at the office of the Press.
ap19

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.

2d. Having two driving wheels, if one slips the other does the work.

3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.

4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.

5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.

6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.

7th. The cutter-bar being hinged to the machine, can be packed up without removing bolt or screw.

8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.

9th. It is mostly of iron, simple in construction, and a boy can manage it easily.

10th. It has no side draft.

11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchasing.

H. A. COBB, R. H. SINTON,

REAL ESTATE AND STOCK AUCTIONEERS,

OFFICE AND SALESROOMS—No. 102 Montgomery Street.

PEREMPTORY SALE OF 500 HOMESTEAD LOTS

IN THE

HAYES' VALLEY TRACT,

—AT—

PLATT'S MUSIC HALL, Montgomery Street.

SECOND GRAND SALE OF THIS VERY DESIRABLE PROPERTY.

NOTICE—ON SATURDAY, THE 27th DAY OF APRIL, A. D. 1861, AT 12 O'CLOCK noon, we shall offer for sale, at Platt's Music Hall, Montgomery street, without reserve, to the highest bidder,

500 HOMESTEAD LOTS

—IN THE—

HAYES' VALLEY TRACT,

In subdivision of 30 by 109 feet, and 27½ by 120 feet, with front and rear entrances.

The location of this beautiful property is well known to every inhabitant of San Francisco and therefore needs no special remark or commendation. The Market Street Railroad, with its branch to "Hayes' Park," passes through the midst of the lots now offered for sale, thus affording easy access to the heart of the city every hour of the day. The soil is prolific, and an abundant and never failing supply of water can be had at an average depth of 10 feet throughout the Valley.

The streets and roads are all graded, and many of them macadamized, so that carriages can drive past every lot offered for sale.

THE TITLE TO THIS FINE PROPERTY IS PERFECT.

TERMS OF SALE will be announced in a few days, at which time LITHOGRAPHED MAPS and CATALOGUES of the property can be had at our salesroom.

H. A. COBB.
R. H. SINTON.

A JOURNAL OF SCIENCE, ART, MINING, AGRICULTURE, MANUFACTURES, CHEMISTRY, INVENTIONS, ETC.

VOL. III.

SAN FRANCISCO, SATURDAY, APRIL 27, 1861.

NO 5

[From the Scientific American].
Improved Rotary Spader and Pulverizer.

THE object of the invention here illustrated is to introduce the great advantages of the rotary motion into mechanism for cultivating the earth, none of the various plans heretofore proposed for this purpose having come into general use. The principal feature of this invention consists in the combination of revolving spades with scraping plates to remove the earth from the spades as they rise from the ground.

Fig. 1 of the annexed cuts represents a perspective view of the machine, propelled by steam, and Fig. 2 is a longitudinal vertical section of the principal parts. To the axle of the large supporting wheels A A, is rigidly secured the long drum, B, from the periphery of which the spades, C C, project in rows extending across the machine. As the machinery is propelled forward, the spades are pressed into the ground, and, if the soil is adhesive, they commence their ascent with loads of it upon their upper sides. To secure the removal of the earth from the spades, scraping plates, E E, (Fig. 2), are arranged between the several rows of spades, these plates being hinged to the drum at one edge, so that the other edge may swing outward, and thus scrape the soil from the spades. Upon the ends of the plates, E E, are firmly fastened the cam plates, D D, which come in contact as the spades leave the ground, with the friction wheels, F and are thus pressed outward, carrying the scraping plates with them. The plates, E E, fall back upon the drum by their own gravity, and as the spades are forced into the soil these plates yield upward to the pressure of the earth. The drum, B, is so connected with the frame that it may be raised or lowered to adjust the penetration of the spades to any depth required.

A second feature in this invention is the combination with the other parts, of a toothed revolving drum, for finely pulverizing the ground in cases where this may be desirable. This drum, G, suitably provided with iron or steel teeth, is connected by gearing with the driving wheels, so as to receive a rotary motion in a direction the same or opposite to that of the cylinder which carries the spades. The axis of the drum, G, has its bearings in a toothed segment, which is concentric with the gear wheel, H, and this segment meshes into a similar one on the rock-shaft I; so that by turning down the lever, J, the drum G, can be lifted clear off the ground, and thus thrown out of operation when it is not needed. When the machine is in operation, the supporting wheels on the outside of the frame-work are raised from the ground, or entirely removed, so as to leave no track on the spaded grounds.

Application for a patent for this invention has been made through the Scientific American Patent Agency, and further information in relation to it may be obtained by addressing the inventor, W. Wadsworth, at San Francisco, Cal.

NEW STRIKES.—We hear of several new and valuable mining strikes during the past few days. A rich vein of quartz has been struck, in the road, near the Brighton House, on Massachusetts Hill. The wheels, in passing over the croppings, had broken down the rocks, and the late rains exposed its hidden treasure to some casual passer, who commenced digging, and struck at once upon a valuable lead.—*Nevada National.*

GARDINER'S POINT.—In the hydraulic claims of Gus Wagner and Rad. Hackett, at the Point, there are four pipes running and fifteen men at work. The miners are at present running off top dirt, and probably they will continue stripping till the first of next month. In the Comet claims (tunnel) ten dollars a day to the man is being made; eighteen hands are at work, and eight more will soon be added.

JAMES Stewart, of Oregon Gulch, Trinity county, was recently killed by the caving of a drift.

WADSWORTH'S ROTARY SPADER AND PULVERIZER.

Fig. 2

THE RAINS—MINING.—While the recent rains have been productive of incalculable good to the agricultural and general mining interests of the entire State, the quartz miners of Grass Valley have suffered most seriously. Full six weeks have been entirely lost in their operations, and the damage to mines and pumping machinery has been quite large. The heavy rains which annually fall in the mountains must ever prove a heavy drawback to deep mining operations in California, greatly increasing the expenses of working, over mines wrought to a similar depth in other countries. Fully five times the quantity of rain falls here which descends upon the mines of Cornwall, and, of course, it is necessary here to raise that extra quantity of water from the mines. It is greatly to be feared that this fact, one hitherto almost entirely overlooked, will, as our working increases in depth, add so greatly to the expenses as to seriously impair the present estimated value of many first-class mines.

NEW GOLD FIELD.—A correspondent, writing from Santa Fe, New Mexico, on the 26th of January, to a St. Louis paper, says Kit Carson informed the people there that the news had reached Taos by returning prospectors, that a new field of gold, much richer than any in California, had been found on the San Juan, two hundred and thirty miles northwest of Taos, but the snow being very deep they did not go to work, but will commence early in the spring.

The Northern Gold Fields.

THE Oregon, Washington Territory, British Columbia papers are filled with exciting accounts of the new gold discoveries at Nez Perces, Lake Okinagan and Forks of the Quesnelle. If these accounts be half true, the gold fields of the north bid fair to rival those rich placer diggings that attracted the first grand rush to California. It is established by these discoveries, in accordance with frequent predictions through many years past, that the gold fields of Mexico, extending through California, embrace the entire mountain ranges running up this coast. Many of the mining reports are essentially like those which used to go East from this State.

MORRISTOWN.—Plenty of water at this place; lots of work and more to be done, but plenty of men there to do it. The American Company has contracted with John Kendall, to run a bed rock tunnel one hundred feet in length, for two thousand six hundred dollars. A couple of young Benedicts returned the other day to Morristown, and received a serenade, which, although quite a compliment, no doubt, was pretty expensive to the serenaded ones.—*Mountain Messenger.*

THE monthly yield of the Grass Valley mines, or that part of it only which finds its way to the Mint, is estimated by those who are capable of arriving at pretty correct results, at \$350,000 monthly, or \$4,200,000 per annum. The amount which takes other directions will swell that sum to full five millions of dollars. A pretty good yield for a place of the size of Grass Valley.—*ib.*

RICH QUARTZ LODE.—The quartz lode of G. L. Gale, Amador county, is paying handsomely—\$100 per ton of rock. The lode varies from one to three feet thick.

Metallurgical Treatment of Gold.

FUSION OF GOLD DUST.—The most simple metallurgical operation connected with the treatment of gold ore is the melting down into ingots of the gold dust obtained by the mechanical treatment of the various gold bearing deposits. This may readily be effected in ordinary black-lead crucibles, which can be treated in a round pot furnace, such as is used by brass-founders for the fusion of the various alloys of copper. Before the gold is introduced into the pot (which should previously be heated to redness), it must be mixed with a little dry borax, and as soon as the complete fusion of the mixture has taken place, the slag, which will be found floating on the surface, is thickened by the addition of a little lime or bone ash, and carefully skimmed off. The pot is now removed from the fire by the aid of powerful tongs, which grasp it firmly on the outside, and the metal poured into a cast iron mold, previously warmed and slightly greased on the inside. Instead of using borax alone, a mixture of borax and corrosive sublimate is sometimes used; the advantages of the addition of this substance are, however, extremely problematical, as its only effect on the results obtained would appear to be entirely due to the mechanical action communicated to the mixture by the volatilization of the mercurial salt. When the gold dust operated on contains a considerable quantity of the more oxidizable metals, the addition of a small amount of oil will be found advantageous. The slags skimmed off from the surface of the liquid metal, as well as the pots in which the fusion has been conducted, are subsequently ground down, and subjected to a careful mechanical preparation. The auriferous schlich thus obtained is afterwards fused with various substances yielding lead, and the resulting alloy treated by cupellation.

SMELTING GOLD QUARTZ.—From the great degree of infusibility exhibited by silica, of which sand and quartz are almost entirely composed, the process of smelting gold ores—that is to say, of extracting from them the metal by direct fusion, instead of first effecting their concentration by mechanical means, has hitherto failed in its application.

A process has, however, been recently secured by patent, which is stated to be extremely successful in the separation of gold from the siliceous gangue with which it is commonly associated. The ores to be treated by this method are first reduced to the state of a fine powder, and then fused with a mixture of lime and oxyd of iron with which the silica combines, giving rise to the production of various fusible silicates or slags. Into the fused mass thus obtained plates of wrought iron are from time to time introduced, and again withdrawn as soon as a thick deposit of metallic gold has taken place on their surfaces. As soon as these iron plates are removed from the fused ore they are plunged into a vessel of melted lead, by which the gold is dissolved off, and the iron plate is again placed in the furnace. It is stated that by the continued repetition of these manipulations, the whole of the gold is extracted from the ore, and that this is effected at a considerably less cost than is incurred by the usual processes of washing and amalgamation. Whether this process will really be found applicable to manufacturing purposes, experience alone can decide.

It was some years since proposed by a Russian gentleman, called Anosow, to melt the auriferous sands of the Ural Mountains with iron, or iron ore, instead of subjecting them to the various processes of washing by which they are at present treated. The auriferous cast iron thus obtained was dissolved in sulphuric acid, and the gold remained in the form of an insoluble residue in the bottom of the vessel in which the attack was made. This process, although stated by the inventor to be extremely economical, was never practically applied; and, in spite of the assertions made to the contrary, its success, if attempted, would be extremely doubtful.

The usual method of smelting auriferous ores, when they are sufficiently rich to admit of being metallurgically treated, is to fuse them, either with metallic lead or with some compound capable of liberating that metal during the elaboration of the charge in the furnace. The materials most commonly employed as sources of lead in the smelting of gold ores are litharge and galena, although the rich slags obtained both from the smelting furnace and ore-hearth are also occasionally used. In all these cases, the lead produced acts at elevated temperatures on the particles of gold in precisely the same way as the globules of mercury in the ordinary process of amalgamation. The auriferous lead, so prepared, is subsequently subjected to cupellation, and the gold is thus obtained either in a free state, or in combination with a certain amount of silver, from which it may be separated by the operation of parting. When litharge is chosen as the medium for the introduction of lead into the furnace, it will be sufficient to add with it about five per cent of small coal or coke-dust, in order to determine the reduction of the necessary quantity of lead; but when galena is employed, it is necessary to charge into the furnace a certain quantity of scrap iron, by the action of which the lead is set free.

The furnaces used for this purpose may be either of the reverberatory form, such as those employed in the English method of copper-smelting, or may resemble the ordinary slag-hearth, in which the lead is extracted from the slags of the smelting furnace and ore-hearth. The choice of the form of the furnace to be used, as well as the nature of the fluxes to be employed, must not only depend on the nature of the metal treated, but also on various local circumstances, with

which the metallurgist must make himself acquainted. As a general rule, however, the fuel employed for the reverberatory furnace should be pit-coal; and, consequently, in situations where this is not to be readily procured, the blast-furnace and charcoal must be used. Those ores which contain large quantities of quartz (silica) are rendered more fusible by the addition of bases, such as lime or oxyd of iron; whilst ores in which lime or oxyd of iron predominate, are rendered more easy of fusion by the judicious admixture of clay or siliceous sand. It may also be remarked that, when the reverberatory furnace is not used, the addition of oxyd of iron as a flux must be as much as possible avoided; since, in the blast furnace, a certain quantity of that oxyd is invariably reduced, and unites with the other metals present.

Instead of employing lead as the means of concentrating the ores of gold, iron pyrites is sometimes the agent employed. This mineral, on being exposed to an elevated temperature, loses exactly one-half its sulphur, and becomes converted into a ready fusible sulphide, which has the property of uniting with the gold present, and separating it from the associated gangue. When, then, gold ores—such, for instance, as auriferous quartz—are fused in a small cupola furnace with iron pyrites, which may itself likewise contain gold, the sulphide of iron unites with the greater portion of the gold present, and forms a heavy regulus or "matt," which subsides beneath the surface of the slags and scorie produced by the fusion of the earthy and siliceous gangue of the mineral treated. The matts thus obtained are subsequently roasted, so as to deprive them of a further portion of their sulphur, and again fused with fresh portions of the ore to be treated.

By operating repeatedly in this way, matts very rich in gold are ultimately obtained; and, on fusing these with litharge, or a mixture of galena and metallic iron, the gold is abandoned to the liberated lead, from the top of which the impoverished sulphide is readily skimmed off. The rich lead thus obtained is afterwards treated by cupellation.

CUPELLATION ON THE LARGE SCALE.—The extraction of the silver and gold contained in rich lead is conducted on a cupel forming the bottom of a peculiarly arranged reverberatory furnace. In this operation, the litharge produced, instead of being absorbed by the substance of the cupel, as in the case of gold and silver assays, is run off in a fluid state. The fire place of a cupelling or test furnace is usually about two feet in breadth and two feet six inches in length. This is separated from the body of the furnace by a fire-bridge eighteen inches in breadth, so as to allow the flame and heated air to pass directly over the surface of the cupel, from whence it escapes through separate flues into a high chimney. The cupel or test consists of an oval iron frame, surrounded by a ring four inches in depth; its greater diameter may be about four feet, and its lesser two feet six inches. This frame, in order to afford a better support for the bottom of the test, is provided with four or more cross bars, which are four inches in width and half an inch in thickness; the first of these is placed nine inches from the forepart of the ring, and the others at about equal distances between this bar and the other extremity of the rim. This test-frame is now beaten full of finely powdered bone-ash, slightly moistened with water, containing a small quantity of pearl-ash, which has the property of giving consistency to the bone-ash when heated. The center of the cupel, when the ring has been well filled with this mixture and solidly beaten down with a rammer, is scooped out with a small trowel, until the sides are left two inches in thickness at top and three inches at bottom, whilst the thickness of the sole itself is reduced to one inch above the surface of the iron cross-pieces.

At the fore-part of the test, called the breast, the width of the border is increased to five inches; and a space is here cut through the bottom, which communicates with the passage or gateway by which the fluid litharge makes its escape. The test, when thus prepared, is placed in the refinery furnace, of which it forms the bottom, and is firmly wedged at its proper height against an iron ring, built into the masonry of the furnace.

When this furnace is first lighted it is necessary to apply the heat with considerable caution, since, if before the test had become sufficiently dry, it were suddenly exposed to too high a temperature, it would be liable to split and fall to pieces. As soon as the test has in this way been raised to a cherry-red heat, it is evenly filled with the rich lead to be operated on, and which has been previously fused in a cast iron pot set in brickwork at the side of the furnace. The melted lead, when first ladled into the test, becomes covered on the surface with a grayish dross; but, on further increasing the heat, the surface of the bath uncovers, and a film of ordinary oxyd of lead, or litharge, begins to make its appearance.

The blowing apparatus, which furnishes the blast through a nozzle at the other extremity of the test is now set in motion, and forces the litharge from the back part of the cupel up to the breast, and over the gateway, from which it falls through the aperture in the test into a movable iron pot placed on the floor for its reception. The current of air which may be supplied either by a ventilator or bellows, not only sweeps off the litharge from the surface of the lead, but also furnishes the amount of oxygen necessary for its formation.

In proportion as the surface of the lead becomes depressed by its continual oxydation, and the constant removal of the litharge formed, more metal is added from the melting-pot, so as to again raise it to its proper height; and in this way the

operation is continued until six or eight tons of the original rich lead have thus been introduced into the cupel.

The contents of the test are now so far reduced in volume that the whole of the precious metals contained in the alloy operated on may remain in combination with only two or three hundred weight of lead, which is now removed from the test by making a hole through the bone-ash, of which the bottom is composed. When the lead has been thus removed, the tapping hole is again closed by a pellet of moistened bone-ash, and another charge immediately introduced. As soon as a sufficient number of these parcels of rich lead have been obtained as are found by assay to yield from one to two thousand ounces of the precious metals, they are again melted down and placed in a cupel, where the operation of refining is completed. The test used for this final cupellation differs from that in which the lead is first introduced, by being made more hollow at the bottom, so as to give a certain degree of thickness to the resulting plate of metal. When the operation is completed, the same brightening is observed which takes place at the close of experiments on smaller quantities; and if the gold present contains a considerable amount of silver, the surface of the mass, on cooling, sprouts forth into the most beautiful arborescent forms. The separation of the gold and silver obtained, as above described, is usually effected by means of nitric acid, although, on the Continent, sulphuric acid is largely employed for this purpose.

In addition to gold, many auriferous deposits, and particularly those of the Ural districts, afford a certain amount of platinum. This metal is invariably found in the native state, and presents the appearance of small flattened grains of a grayish-white color. These are insoluble in all the simple acids, but are readily dissolved in aqua regia; on adding to the solution thus obtained a small quantity of chloride of potassium (muriate of potash), a copious yellow precipitate is obtained. This test, together with its high specific gravity (20.98), will be sufficient for the recognition of this metal, which, when in a manufactured state sells at about 30s. per ounce.

Diamonds, which sometimes accompany the ores of gold and platinum, usually occur in the form of transparent octahedral crystals. These crystals resemble two four-sided pyramids joined together by their bases. The value of rough diamonds unless of extraordinary dimensions, may be estimated at about \$50 per oz.

New Discoveries.

On the 28th of March, Messrs. Russel and Joseph Cox discovered a remarkably rich silver lode about twenty-eight miles east of this place, near the Carson Valley road—about half a mile north of it, and near to Cox's station—which contains gold, silver, lead and antimony. Specimens of some of the quartz taken from the surface and also from the depth of three and five feet, have been assayed. That from the surface produced forty dollars to the ton in silver; that from the depth of three feet, one hundred and fifty-six dollars to the ton, and that from the depth of five feet, one hundred and sixty-one dollars—one hundred and twenty-nine dollars in silver and forty dollars in gold. Two of the assays were made by Mr. Brewster, of Upper Placerville, and the other by Mr. Arvidson. The width of the lode is some five or six feet on the surface, and appears to increase as the shaft is sunk. The company now having an interest in the claim, consist of Russel Cox, Thomas Cox, Henry Cox, John Harlow, John Kromer, D. A. Upham, Mark L. Bush and Martin Shroder. Their claim is 2400 feet long. The discovery and locality only became publicly known on the 10th inst., and by the next day there were a number of claims staked off. The discovery has produced quite an excitement, and a number of persons from our city and vicinity have gone to see the elephant. There is in the immediate vicinity of the lode, any amount of good timber, and water power sufficient to run any number of mills. We saw and examined some specimens of the quartz, which appeared to be remarkably rich indeed.—*Central Californian.*

DISCOVERY OF A CAVE.—On Wednesday last, a party of gentlemen, of this place, visited a cave which had been entered the day before by Dr. Heming, Charles and Doyle Thompson, and others whose names we do not know. This cave is located on a narrow limestone belt, some three miles below Jackson, and within a stone's throw of Jackson creek, and is a small ridge, thickly covered with chaparral, which, no doubt, accounts for the fact of its not having been sooner discovered. There are two entrances, the main one on the north side of the hill, and the descent to the bottom is about thirty feet, and not difficult. The main chamber is about ninety feet in length, and seventy five in width, and the ceiling from ten to thirty feet. There are but four stalactes and no stalagmites—the floor being deeply covered with decayed vegetable matter—though portions of the wall and ceiling are beautifully incrustated with carbonate of lime. We understand that some gentlemen residing near there intend renovating it; if they do, it will prove a pleasant summer resort, and is now well worthy a visit. It has been christened "Joaquin's Cave."

BIG PAY.—The Town Talk Company, at Howard's Hill, near Grass Valley, cleaned up twelve sluice boxes, some time ago, from which the company realized the handsome little sum of \$7,050, the proceeds of a week's labor.

To Explorers, Discoverers, Prospectors, and Miners,
on the Pacific Coast.

Of the Instruments and Processes of Subterranean Operations.—It is by the aid of geometry, in the first place, that the miner studies the situation of the mineral deposits, on the surface and in the interior of the ground, determines the several relations of the veins and rocks, and becomes capable of directing the perforations toward a suitable end. The instruments are: 1. The magnetic compass, which is employed to measure the direction of a metallic ore, wherever the neighborhood of iron does not interfere with its functions. 2. The graduated semi circle or clinometer, which serves to measure the inclination. 3. The cord or chain, for measuring the distance of one point from another. 4. When the neighborhood of iron renders the compass uncertain, a plane table or plate is employed.

Means of Penetrating into the Interior of the Earth.—1. Manual tools; 2. Gunpowder; and 3. Fire. The pick is a light tool used for digging or removing in small quantities. The side is used as a hammer; the point is of steel, carefully tempered. The gad is a punch or wedge of steel, with a wooden handle, driven into small openings of rocks. The shovel has a pointed form, to enable it to penetrate among the coarse and hard fragments of the mine rubbish. The blasting or shooting tools are, a mallet, borer, claying bar, needle or nail, scraper, tamping-bar. The borer is an iron bar, tipped with steel, formed like a thick chisel. A hole being bored, a cartridge is inclosed in it, furnished with a stem or tube, through which the powder may be inflamed. Any soft species of rock, free from flinty particles, is used for cramping the whole, and is rammed by the tamping-bar. Each hole bored in a mine should be so placed, in reference to the schistose rock, and to its natural fissures, as to attack and blow up the least-resisting masses. The quantity of gun powder should be merely sufficient to split it. In certain rocks and ores of extreme hardness, the action of fire is used with advantage, to diminish the cohesion of the rock.

When the existence of a deposit of ore is merely suspected, without positive proofs, recourse must be had to labors of research, in order to ascertain the richness, nature and disposition of a supposed mine. Subterranean workings afford the most satisfactory workings. They are executed, 1. By longitudinal galleries, hollowed out of the mass of the beds or veins themselves, in following their course; 2. By transverse galleries, pushed at right angles to the direction of the veins; 3. By inclined shafts, which pursue the slope of the deposits, and are excavated in their mass; 4. By perpendicular pits. If a vein or bed unveils itself on the flank of a mountain, it may be explored, according to the greater or less slope of its inclination, either by a longitudinal gallery, opened in its mass from the outcropping surface, or by a transverse gallery falling upon it in a certain point, from which either an oblique gallery or a sloping shaft may be opened.

Metallic ores occur in four modes: 1. In regular, interstratified layers or beds. 2. In veins or fissures crossing the strata, and filled with the ore, united with some matrix. 3. In irregular masses. 4. Disseminated in small fragments through the rocks.

METALS—THEIR CHEMISTRY AND GEOLOGY.

General Properties.—A metal is a body which conducts electricity and heat, which is opaque, and has a high and peculiar brilliancy, known as the metallic luster.

Extraction.—Metals are seldom found naturally in their metallic form. When they so occur they are said to be in a native state. Their characters are generally masked under some form of combination with oxygen or sulphur, and are then said to be in the state of ore. They are met with, generally, in veins penetrating the strata, intermixed with various earthy substances. To separate the metal, after it is dug from the mine, the mass is broken up, and subjected to the operations of sorting, stamping, washing, roasting, smelting and refining. Under each metal will be included the method of reducing its ores.

Assaying.—This is the determination of the quantity of any particular ore, to discover whether it will be worth while to extract it largely, and in what manner the process is to be conducted. The knowledge requisite for this is called the doctinic art.

1.—**GOLD.**—*Geognostic Situation.*—This metal has hitherto been found only in the metallic state, either pure or in combination with other metals. It occurs in veins, and disseminated in primary and secondary rocks, and abundantly in alluvium or drift, which constitutes certain plains, and margins of rivers. The rocks in which it most often occurs are granite, quartz, slate, hornstone, sandstone, limestone, gneiss, mica-slate, and especially in talcose slate, and rarely in graywacke and tertiary strata, but never in serpentine. It also occurs in veins of iron ore, antimony, zinc, lead, barytes, etc. When the metal exists in the bosom of primary rocks, it is particularly in schists. The gold of commerce is almost exclusively found in alluvial deposits, where it occurs in small particles or grains, called gold dust, mingled with debris. It sometimes occurs in beds or layers, instead of veins which conform to the regular structure of the slaty rocks. It is usually found alloyed with small portions of other metals, particularly silver and copper.

Extraction.—When native gold is found in a state of mixture with foreign matters, its extraction is commonly performed by amalgamation with quicksilver. The whole of the matter procured from the vein is collected and broken into pieces, about the size of a nut, which are arranged into

heaps according to their richness. The quantities thus procured are afterwards freed from most of the stony matter mixed with it, by pounding and washing. They are then reduced to powder, and made into a thick paste with salt and water. Quicksilver is now squeezed through a leather bag on the mixture, and as the metal flows in minute globules, it is intimately blended with it by means of wooden spatulas. When the requisite quantity of mercury is added the whole is beaten together, and kept for two or three days about the temperature of boiling water, by which means the union of the metals is promoted. The earthy matter is then carried off by washing or levigation, and most of the mercury removed by squeezing the remainder through a leather bag. The residue is subjected to distillation or benolity, by which the mercury is expelled and the gold obtained alloyed perhaps, with a little silver. When the gold is contained in other ores, the metallic ore first separated from the earthy substances. For doing this, the ore is reduced to a powder in stamping mills. This mill consists of a cistern through which water flows, and heavy beams of wood, terminated below by iron, and moved upwards and downwards. The powder is carried off by the stream into vessels, when it is deposited; the heaviest being deposited nearest the cistern. The vessels are of different sizes; that nearest the cistern being about twelve feet long and nine inches in breadth, and as many deep. The others gradually enlarge as they retire. They also vary in their inclination, the first having a slope of about three inches, the second about one inch, the third and fourth about half an inch, and the fifth and sixth being level. Each vessel is furnished with a groove at the extremity farthest from the cistern, into which pieces of wood are placed varying in height according to the quantity of ore collected in the vessel, and each vessel communicates with that beyond it. When the water flows from the mill into the first vessel, the heavy part of the ore is deposited and collected where the wood is put into the groove; as the powder reaches the top of this another piece is put over the former, and so on till the vessel is nearly filled; then the water is allowed to flow into the second vessel, and from thence, when full, into the third. The particles of ore thus procured are still farther freed from impurities by washing. Each parcel is put into a wicker basket, into which a stream of water flows, and is received on inclined tables, grooved in various directions. If the gold thus procured is mixed only with earthy matter, it is triturated with quicksilver, as before described, or fused in crucibles with some flux, as nitre or pearlash. If, however, it contains inflammable matter, as sulphur, it is roasted. Lime and lead ore are mixed with it in quantity proportionate to the gold, and kept at a red heat till part of the sulphur is driven off. Increase the heat until the whole melts, after which pour it into molds of sand. By repeated fusions, the gold is obtained alloyed only with silver, copper and lead, from which it is freed by refining or cupellation.

The impure gold is melted with two or three times its weight of lead, and exposed to heat on a cupel under a muffle or on a hearth of a refining surface. When the greater part of the foreign metals is abstracted, the remaining fused metal, if the process is completed, exhibit various colors, and at length suddenly brighten, and its surface become highly luminous. The metal is detached while hot. The gold even after this process, may be alloyed with a little silver; it is therefore subjected to the operation of parting. The principal agents employed in this process are nitric acid, marine acid, and sulphur. Parting by the first is the most convenient and most used. It is called simply parting. That made by marine acid is by cementation, and is called cement parting. Parting by sulphur is made by fusion, and is called dry parting.

[To be Continued.]

Theories of the Formation of Mineral Veins.

BY J. D. WHITNEY, STATE GEOLOGIST.

VEINS have originated in the filling of fissures, by injection of metallic and mineral matter in a state of igneous fluidity from below. This is the theory usually adopted to account for the phenomena of the veins of so-called igneous rocks, such as granite and trap; which, like modern lava, are supposed to have been once in a plastic or semi-fluid state, under the influence of a high temperature, and in such a condition to have invaded the superincumbent rocks, being forced into the crevices by upward pressure. However such a theory may adapt itself to the Plutonic veins, it cannot be considered as explaining the modes of formation of metalliferous lodes. It fails to account for, or rather is contradicted by, the often observed fact, that the character of the lode changes with the rock in which it is found, being rich in ore in one formation and barren in another adjacent one. This could not be the case if the vein had been forced up through the strata, as the nature of the rocks through which it was raised could have had no influence on its contents, the action being but momentary and mechanical. Besides if we consider the immense force which must have been required for such an upward motion as this theory supposes, it will be apparent that had it really taken place, evidence of its existence must have remained in the widening out of fissures in depth, and in the shattered condition of their walls; while there would have been a constant tendency in the more valuable metalliferous substances, being heavier than the veinstone itself, to occupy the lowest position in the vein. Such phenomena, however, have only been observed in isolated cases, while usually the appearance of the walls and the distribution of the mineral

matter and ore between them in true metalliferous veins, is such as to make this hypothesis of their formation entirely untenable.

The theory of formation by sublimation, according to which vein fissures were filled by the volatilization of metallic matter from the great center of chemical action beneath, namely, the ignited interior of the earth. That such may have been the origin of some metalliferous deposits, and that this agency may have contributed in some degree to the filling of veins, cannot be denied. The fact of the volatility of some metallic combinations is well known, and can be observed at the present day in the products of volcanic ejections. Evidence of the same character is afforded, in some instances, by the position of metalliferous particles on the under side of crystals lining the walls of a lode; as, for instance, at Nagyag, in Transylvania, where metallic arsenic is seen to have been sublimed and deposited on those faces of crystals of manganese spar which were turned downwards.

Specular iron is found sublimed into the fissures of volcanic craters, and sometimes carried to a considerable distance, and deposited. But these phenomena are of limited extent, and not by any means sufficient to account for the existence of the masses of ore and of earthy minerals filling the body of a large vein. Neither would such a theory account for the variation in the character of lodes in passing from one kind of rock to another, nor for the presence in them of substances not volatile in their nature, nor for any of the complicated phenomena exhibited by veins in their intersections with each other. Hence we must conceive that the agency of sublimation was of very secondary importance in the formation of regular metalliferous veins. In contact deposits, and some irregular forms of occurrence, where the whole mass of a lode seems to have been impregnated equally throughout by metallic particles, as especially exemplified in some mercury mines, we can conceive of no theory more probable than that of the diffusion of the metallic matter through them by sublimation. Thus originated the extensive beds worked at Almaden, so rich in mercury; and they offer the most striking example which can be given of the class of deposits to which this theory may be applied.

The theory proposed by Werner, which may be called that of aqueous deposition, presupposes a chemical solution covering the region in which the veins are found, from which solution, by chemical precipitation from above downwards, the vein-matter was accumulated in the fissures existing in the rocks below. This theory is in direct opposition to that of igneous injection, since, according to its principles, the origin of the contents of veins was a superficial one, their introduction into the fissures from above instead of from below, and the action a chemical instead of a mechanical one. But, in the sense in which this mode of formation was understood by Werner, but little importance can be attached to it. If any such fluid holding metalliferous substances in solution had actually covered the surface, we can conceive of no reason why it should have deposited its contents in the fissures rather than on the surface adjacent; and we ought, in accordance with his ideas, to find every vein connected with a flat sheet of metalliferous ore somewhere along its course, at the place which the solution occupied in the series of formations at the time of the filling of the vein-fissure. Such, however, is not the case, at least in regard to true veins; although there may be a limited class of mineral deposits to which this theory will apply. Besides, if disposition in veins took place in this manner, we should expect to find more or less matter introduced at the same time, mechanically, and showing its origin by its stratified condition. There is nothing of this kind, however, observed in true veins. The deposits all took place in a direction parallel to the walls, and not horizontally, as they would have been, in part, under the circumstance required by this theory. There are many other reasons equally conclusive against the ideas of Werner; but it is not necessary to enter into them at length, since his theoretical views with regard to the origin of veins have ceased to have the weight which was once attached to them.

NEVADA ITEMS.—We condense the following from the *Democrat* of the 13th:

A robbery was committed by four men at the cabin of one Schingle, near Nevada, last Friday night, while he was in bed in his cabin. The men were disguised, and when they had secured him they ransacked the cabin, got a small sum of money and decamped.

A workman in the shaft of Collins & Co., was nearly killed last Friday, by a tub of dirt falling on his head, in consequence of the breaking of a rope.

A new cemetery has been laid out near Nevada, on the Red Dog road.

A miner was severely injured near Caldwell's mill, by a bank caving upon him, not long since. His collar bone was broken and his body badly bruised.

FROM THE POTOSI MINES.—The *San Bernardino Herald* chronicles the arrival at that place, on the 29th ult., of a party of men from the Potosi mines. They report a large migration from California on the way thither. Considerable activity is manifested at Potosi in erecting buildings, and the furnace of the Colorado Mining Company will have been completed ere this. Several new and valuable claims have been discovered some four miles south of the Colorado Company's lode, on another range of mountains—the snow heretofore having prevented any person from examining them sooner. No doubt exists but that this lode will be traced for miles.

Mining and Scientific Press.

Classification of Rocks.

BY J. G. HORTON, M. D.

Much confusion has always prevailed in this department of geology, and often to the almost utter discouragement of the student in pursuit of geological knowledge. I allude to this fact as being not only a matter of my own personal experience, but also with very many others with whom I have had intercourse upon this particular branch of the science.

In examining the various authors upon the classification of the rocks composing the crust of the earth, we find a strong tenacity generally manifest to the adherence of certain self-conceived opinions, often speculative and discrepant wanting in that degree of lucid naturalness so desirable and essential to inductive science. More especially does this conclusion prevail in the classification of what has been termed non-fossiliferous or metamorphic rocks.

The nomenclature generally used in the lower series of rocks, I do not think well of; for instance, the term metamorphic is often made use of to designate a class of rocks which have undergone a change or transformation since their original conformation. This is a word of great latitude, and might with almost equal propriety be applied to nearly the whole crust of the earth; for all classes of rocks, both the stratified and unstratified, have undergone many changes since their original creation, either by mechanical, chemical, or other combined agencies. Now, all rocks, no doubt, belong properly to one of the two great general classes, igneous or aqueous, and could not have been produced without the presence of one or the other of these elements, and hence, it is natural to make such general classification. Again, all rocks are either stratified or they are not; they also either contain fossils or they do not. These are facts generally conceded. A system of arrangement or classification in any science which is based upon facts, natural and practicable, is by far preferable to any other, and the more simple and concise, the more easy is it in general application. The student of geology is supposed to have well learned his A B C, or, in other words, to have made himself familiar with the sciences of Botany, Zoology, Chemistry, and Mineralogy; then, and not till then, is he fully prepared to advance in the science. Thus prepared, the student will at once perceive a want of perspicuity and naturalness, very much needed. To say that a rock is porphyritic, felspathic, or earboniferous, is not all proper enough; to say that it is calcareous, siliceous, or micaeous, is well; but this only has reference, naturally, to its mineral character, without any definite regard to a lucid classification. But if we say a rock is non-fossiliferous, it is at once comprehensive and natural; we know that it does not contain organic remains, no matter whether it be stratified or unstratified, as this latter has no bearing upon a natural classical arrangement. For all practical purposes, then, I can see no impropriety, but rather essential simplicity and distinctness, in placing all the non-fossiliferous rocks in one general class, no matter what may have been their origin, whether igneous or aqueous, whether stratified or unstratified, and let their physical and mineralogical condition and appearance determine their relative age and position. This class of rocks, I would suggest, be denominated the first or No. 1. The reason for such arrangement is both simple and natural, because they most distinctly direct us to that period in geological history when animal and vegetable life did not exist, as also do their crudeness and mineral composition, whether produced anciently or recently, they are not conditioned to the development and progress of organic life. The arrangement of the fossiliferous rocks, I am happy to know, has been somewhat simplified. By the suggestion of Mr. Lyell and others, a classification has been founded purely upon paleontological principles, which is natural, simple and comprehensive. Yet to make the whole classification still more simple and natural, I conceive that the minerals should be made use of throughout the whole series, commencing with the non-fossiliferous as 1st, the lower order of organic remains as 2d, and so on through all of the ascending series up to the highest order of animal and vegetable life. This would be certainly the most natural classification, and what is most natural in science is by far preferable. All scientific minds will accede, I think, to the essential necessity of a simple and definite classification of the rocks in the pursuit of geological knowledge, so that the student may see at a glance the field

of his labors. Then by the aid of the other sciences, zoology, botany, chemistry and mineralogy, he will be enabled to mark the mineral character of rocks in the different geological epochs, to study the nature, character and habits of animals and plants from one period to another in the earth's history, and mark their progressive advance with a precision almost as easy as in the living species.

Practical Utility of Botanical Observations.

As an illustration of this subject, Dr. Kellogg said that while living at Brighton, just above Sacramento City, a few years since, a poor neighbor deplored the loss of his pigs; something they had eaten sickened his promising stock of pigs, and they had nearly all died. He was at a loss to account for the mysterious event, seeing they were so fat and fine when he let them out. Having saved many a planter of the South from impending ruin in this kind of stock, he was not long in divining the cause, although not previously aware of any cause existing in California. It should be remarked that his residence was on the flat above Patterson's, just where the oak timber begins to abound.

The fruit of the biennial bearing oaks, which have bitter acorns, causes a disease of the kidneys, resulting in weakness of the loins, loss of the use of the hind legs, and finally death.

I had observed, says Dr. K., that the squirrels, in their eagerness to get at the acorns in a green and bitter state, bite off the small branches; these, falling to the ground, are devoured by the pigs, as was pointed out to him from his own door, while we were discussing the matter. I said to him, "Shut up your pigs until the acorns ripen, and you will lose no more." This advice was followed, and the remainder saved. In some seasons, when the biennial mast is unusually abundant, many thousands of dollars would not cover the loss of a single State, Mr. Harris, of Columbus, Georgia, had a plantation in Russell county, Alabama, where I was then practicing my profession. I was personally knowing to his losing upwards of thirty head of hogs in a single season. The stock were remarkably large and in fine condition previously.

The hasty facts set forth, and our limits, will not allow more minute details. Similar cases are by no means rare, as any one we may happen to meet can substantiate similar instances.

He invited the attention of gentlemen to the article in the last MINING AND SCIENTIFIC PRESS. Its appearance at this particular juncture was accidental, being in the hands of the publishers previous to this discussion, or any thought upon the subject. It will be seen that the Death Camass is poison. And not only so when eaten by mistake by mankind, but, it may be added, rendering the milk poisonous when fed upon by cattle, often causing their death. A plant of this family at the East is known as Fall Poison, on account of cattle being urged by hunger to eat it when herbage is scarce. It is also well known among medical men in San Francisco that the milk, from some cause, is often poisonous, causing sickness and death among children. Any one in the habit of observing this plant must have remarked that the leaves are sometimes bitten off.

A gentleman of Alameda, Col. T. J. Nevins, informs him that hogs have been poisoned by it or its kindred. A volume would scarcely suffice for examples.

To the intelligent wool-grower, it is often a matter of much importance to know certain dangerous or pernicious grasses and herbs. These our time will not allow us to specify in detail, but as an illustrative case in point, which may be substantiated by referring to a gentleman in Sacramento (Milton Barny). A relation of his purchased a very large stock of sheep in Kentucky, on a speculation, and started South; while crossing the Cumberland mountains he lost thousands in a single night, and had to abandon the enterprise, simply by their eating an herb in the corners of the fence while passing through a lane. The President (Col. L. Ransom) remarked that his son-in-law, while driving his sheep to the southern part of this State, passing some low grounds bordering the tules, his flock cropped some weeds, what kind he could not say; forty head died; but that after crossing some alkaline waters, of which they drank freely, he lost no more.

In conclusion, he suggested that if we could, by any possibility, point out all the advantages of a survey there would be no need of making one. He had not the slightest doubt but that our boundaries of useful knowledge would be greatly enlarged by a thorough and proper survey of the State in all the usual branches of such an enterprise.

DR. BRADLEY'S RELAY MAGNET.

In laying the above illustration before our readers, we experience a particular pride, inasmuch that Dr. Bradley is a California citizen, and that the invention was first conceived in his adopted State. His Electro-magnet for telegraphic purposes has gained for him a world wide reputation for scientific research. We give herewith a still greater improvement effected by him, and as published by an Eastern journal:

On page 200, Vol. III. (new series) of the *Scientific American*, we give an illustration of Dr. Bradley's improved electro-magnet arranged in connection with his improved sounding apparatus. Since the publication of that illustration, this magnet has been extensively introduced into practical use in telegraph offices, and is generally pronounced by operators to be superior to the magnets heretofore in use, in two important particulars. It is more rapid in its operation, and it can be worked by a much feebler current, several operators stating that they find that they can receive messages by it in rainy days when it is impossible to obtain communications at all by the ordinary magnet. We now present an illustration of Dr. Bradley's magnet as arranged for a relay.

By inspection of the cut it will be seen that but a single helix is employed. The soft iron core passes through the helix, *a*, and is bent at right angles over the end of the helix and down its sides, terminating in the two poles, *b, b*. These poles are arranged at sufficient distance apart, laterally, to permit the vibrating armature, *c*, to be suspended vertically between them. The armature is suspended at its middle upon a very delicate spring, which, without any friction, offers the least possible resistance to a vibrating motion, horizontally, of the two ends of the armature. As the upper pole of the magnet, while the current is passing through the helix, attracts the upper end of the armature to the left, and the lower pole attracts the opposite end to the right, the full power of the magnet is exerted to tip the armature from its vertical position, which position is instantly resumed on the cessation of the current. The spiral which draws the armature back to its vertical position is kept in a state of constant tension by a weak counteracting spring; it having been discovered by Dr. Bradley that a spring thus arranged is more prompt in its action than one which returns in its operation to a state of relaxation. At the lower extremity of the armature is a platinum plate, which, as the armature is drawn from the perpendicular, is brought in contact with a platinum point in one of the adjusting screws, thus closing a second circuit in the usual manner.

The outer elbows of the core are, in their whole length, in close proximity to the outer surface of the helix, and are consequently directly under the influence of its magnetizing power; the arrangement embracing the principle of the helical ring.

The following explanation of the prompt action of this magnet, as compared with those heretofore in use, is offered by the inventor. It is plausible, and will be found to suggest a new idea in the science of electro-magnetism:

"By careful observation, in a long series of experiments, I have discovered and satisfactorily demonstrated that, in this form of magnet, the magnetic force developed in the soft iron is more instantaneously and fully established and discharged, and consequently capable of producing more instantaneous and rapid movements of the armature, than it is possible to obtain by the form of magnet in which two helices are employed. The rationale of this interesting and important phenomenon, aside from the arrangement of the parts, by which all friction is avoided, the inertia to be overcome reduced to the lowest point, and the poles brought so near together as mutually to react upon each other, I conceive may be found in an explanation of the two principal modes in which magnetism is induced, and the operation of the laws under which it is developed.

"If we place a bar of soft iron in the interior of a helix, and a current of electricity be made to traverse the helical wire, the iron becomes magnetized. If the length of the bar coincide with that of the helix, the modification in its molecular construction attending magnetization is wrought, upon each and every one of the particles composing it at the same instant of time; and, if the current be intermitting the demagnetizations are equally instantaneous. If the bar

be placed along the outside of the helix, the same effects are produced, though in a degree less marked. If we now take the bar from the helix, and apply to one of its extremities a pole of either an electro magnet or of a permanent one of steel, magnetization is effected as before; but the order in which the molecular derangement takes place among its particles, is essentially different. In this case, the particles constituting the first layer at the end touched are first magnetized; these induce magnetism in the particles of the next layer, and these in the next, and so on until the opposite end is reached. This consecutive induction along the innumerable particles of which the bar is composed, requires appreciable time for its full development—a time somewhat dependent upon the power of the inducing magnet, as well as on the softness and purity of the iron.

"By a moment's inspection of the cut, it will be seen that in this form the mode of magnetization first described prevails throughout; whereas, in the magnet with two helices, the portion of iron that serves to connect the two cores, as well as the armature itself, are magnetized by the latter or consecutive process."

The patent for this invention was granted August 28th, 1860, and further information in relation to it may be obtained by addressing the inventor, Dr. L. Bradley, New York City.

MOORE'S PATENT QUARTZ MILL.

This is a five stamp battery; the framing is constructed of wrought iron strongly braced with diagonal rods, the whole resting on a cast iron mortar bed. The stamps weigh five hundred pounds each and crush through wrought iron grates filled in the mortar bed, which has an opening at the bottom. The mill is principally designed for dry crushing, and for this purpose it is found to be admirably adapted. The ore is fed in the hopper, shown in front in the above cut. It is crushed on the grates; a large portion of it is at once reduced to fine powder, and passes through the spaces between the grates into a channel cut through the mortar block, bending into an elevator which takes it all up, coarse and fine, into a revolving wire screen or bolt set on an incline. The portion of the ores that has been reduced fine enough passes through the screen into a funnel that discharges it ready to be operated upon for amalgamation; whatever portion is too coarse to go through the screen is discharged at the lower end of the bolt and returned to the battery by a conducting pipe to be crushed again. In this way ores may be crushed to any degree of fineness, by having the screens correspondingly fine.

The battery can be constructed for wet crushing by substituting a solid mortar bed, with dies, instead of a perforated one with grates, and it can be made to discharge through screens on every side, if required.

This mill recommends itself to those interested in mining, by its compactness and durability. It saves a large amount of labor and timber, by doing away with the cumbersome wood framing of the usual construction, and at the same time it retains the desirable features of simplicity, solidity, and other advantages of straight batteries; it is easily transported, and does perhaps more work than any other mill with the same weight of stamps. Several batteries of this construction are already in operation in the Washoe silver mines, and it is pronounced by all competent judges to be one of the best mills yet introduced there. The patent has been applied for by the inventor, Mr. J. Moore, and the Vulcan Iron Works Company, of this city, have the exclusive right of manufacturing them.

From Bear Valley.

SEVERAL miners, who are residents of this place, arrived in town on Monday from Hulemb Valley. They report everything prosperous and quiet; all those who are at work get in return for their labor, an average of an ounce a day to the man. Some of the most successful miners have reached as high as thirty dollars to fifty dollars, and on one occasion, one man cleared up, as the product from one rocker, the snug sum of eighty-five dollars. The Lane, Butler & Sliter quartz vein has been opened and exposed to view to the depth of about twenty feet, and an opening made at the side of the vein for a distance of some twenty or thirty yards. Other veins were opened. It was expected the water would not last more than ten days longer for washing in the placer diggings. Still another vein of silver ore had been discovered on the north-west slope of the mountains. A town has been laid out at the east end of Hulemb Valley, by Mr. Cushionberry, and which takes the name of the proprietor—Cushionberry City.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. MUNN & CO., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$5. For arguing the case in the event of a rejection, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as a gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

Prospectus

OF THE

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR!

VOLUME III.—NEW SERIES!

A new number of this extensively circulated paper commenced March 30 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This journal will be valuable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our before extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine & Stationary; Straight Quartz Mills of all sizes and designs; Stamp Shoes and dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goldard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Smut Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lam's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before?" It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe.
Bartola Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco.

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.

2d. Having two driving wheels, if one slips the other does the work.

3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.

4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.

5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.

6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.

7th. The cutter-bar being hinged to the machine, can be packed up without removing bolt or screw.

8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.

9th. It is mostly of iron, simple in construction, and a boy can manage it easily.

10th. It has no side draft.

11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchasing.

KNAPP, BURELL & CO., ap19 310 (Old No. 80) Washington street, near Front, San Francisco.

OFFICE AND SALESROOMS—No. 102 Montgomery Street.

PEREMPTORY SALE OF 500 HOMESTEAD LOTS

IN THE

HAYES' VALLEY TRACT,

—AT—

PLATT'S MUSIC HALL, Montgomery Street.

SECOND GRAND SALE OF THIS VERY DESIRABLE PROPERTY.

NOTICE—ON SATURDAY, THE 27TH DAY OF APRIL, A. D. 1861, AT 12 O'CLOCK noon, we shall offer for sale, at Platt's Music Hall, Montgomery street, without reserve, to the highest bidder,

500 HOMESTEAD LOTS

—IN THE—

HAYES' VALLEY TRACT.

In subdivision of 30 by 109 feet, and 27½ by 120 feet, with front and rear entrances.

The location of this beautiful property is well known to every inhabitant of San Francisco and therefore needs no special remark or commendation. The Market Street Railroad, with its branch to "Hayes' Park," passes through the midst of the lots now offered for sale, thus affording easy access to the heart of the city every hour of the day. The soil is prolific, and an abundant and never failing supply of water can be had at an average depth of 10 feet throughout the Valley.

The streets and roads are all graded, and many of them macadamized, so that carriages can drive past every lot offered for sale.

THE TITLE TO THIS FINE PROPERTY IS PERFECT.

TERMS OF SALE will be announced in a few days, at which time LITHOGRAPHED MAPS and CATALOGUES of the property can be had at our salesroom.

IMPROVED VULCANIZED
GUTTA-PERCHA BELT.

We are now prepared to furnish to Machinists, Engineers, Millers and others, the above article of

Machine Belting,

which has been proved to be far superior to any other kind in use, being

entirely free from the undesirable qualities of both Leather and Rubber.

While possessing the good qualities of both,

IT DOES NOT STRETCH,

it is not affected by oil, heat or steam; and in fact, is well high PERFECT,

as all who have used it attest.

Besides all this, the fact that

It Costs Less

than either Leather or Rubber, which makes it supersede them altogether as soon as its merits are known.

We have also produced an article of

HYDRAULIC MINING HOSE,

which is offered to miners as SUPERIOR to any other article heretofore used

for this purpose. It is made to

Stand Any Pressure Required,

Will WEAR LONGER than any other article; will not Mildew or Rot; costs a moderate price, and is altogether

THE BEST AND MOST ECONOMICAL HOSE

ever used in California. It is made four and a half to eight inches in diameter,

of different thickness, and stretch to stand pressure of from fifty to

200 feet perpendicular fall.

Catalogues and Price Lists sent on application to

CHARLES F. DANIELL & CO.,

Sole Agent for Pacific Coast,

41 California street, San Francisco.

ja24

A. KOHLER,

NO. 178 WASHINGTON STREET, SAN FRANCISCO.

Forty Cases of Musical Instruments Just Received,

Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS.

Also, TAMBORES, BANJOS, FIFES, FLUTES, CLARION PICALOES, VIOLIN BOWS, BOW-HAIR, ROSIN BRIDGES, PEGS, TAIL PIECES, FINGER

BOARDS, TUNING FORKS, SSS ROMAN STRINGS (four lengths and four

thread), and

ALL KINDS OF MUSICAL INSTRUMENTS,

Fresh every two months from Italy.

All of these goods will be sold to the trade, as they are direct importations

from the manufacturers of Europe, and imported in large quantities by A.

Kohler. He will sell them THIRTY PER CENT. CHEAPER than any other house in

California; therefore it would be the interest of all to call and examine before

purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by

the whole block from Clay to Commercial street.

ANOTHER PREMIUM AWARDED TO THOMAS DONOLLY, AT
the Alameda County Fair, held in June, 1860, for the best manufactured
CALIFORNIA YEAST POWDERS.

Read the report of the Committee, which is a sufficient guarantee for the superior quality of T. Donolly's California Manufactured Yeast Powders, and which are now admitted to be superior to any now in use in California or elsewhere. The following is the report of the Committee:

"We would notice as worthy of patronage the very superior Yeast Powders on exhibition by T. Donolly, having tested them, and found them much better than those imported."

Mrs. J. B. Weller,

Mrs. S. E. Alden,

Mrs. C. M. Wentworth,

Mrs. F. K. Slattuck,

Mrs. Dr. Newcomb.

The above decision is a satisfactory guarantee of the superior quality of T. Donolly's famous California Premium Yeast Powders.

People of California! encourage home manufacture, and in the one article of Yeast Powders, you will benefit the State several thousand dollars a year that are taken away for an imported article that cannot compete with your own manufacture.

Try Donolly's Yeast powders, and you will find them superior to any one genuine unless labelled on the top of every can, and dated, 1860. Manufactory, 25 Front street, San Francisco. All orders will meet with prompt attention.

FIRE INSURANCE.

The undersigned offer insurance in the following well known first-class companies, on the most favorable terms:

Hartford Fire Insurance Company, Hartford,

Phoenix Insurance Company, do.,

Merchants' Insurance Company, do.,

City Fire Insurance Company, do.,

Charter Oak Insurance Company, do.,

McLEAN & FOWLER, Agents,

Office—Northeast Corner of Clay and Battery Streets.

TO OUR FRIENDS AND THE PUBLIC AT LARGE.

J. C. MEUSSDORFFER, HAVING RETURNED FROM HIS BUSINESS VISIT TO PARIS, desires to invite the whole hat wearing community to favor him with a visit, and inspect the largest and most beautiful assortment of

Gents', Ladies, Misses, Yonths' and Infants' Hats and Caps,

Ever exhibited west of the Atlantic. They were selected by Mr. Meussdorffer himself, who has eleven years' experience in this State, and who feels confident that all, even the most fastidious, can be suited.

Our Department for Ladies and Misses contains, among others, the following new styles:

EMPERE ELEGANCE,
BOLEDO MONTELO,
TUDOR NOIR,

ANDALOUX MARCON,
IRLANDAIS GISELLE,
FRANCOIS FANTASIE.

IRLANDAIS MONLOW,
BOLEDO MARCON,

Our extensive arrangements in Paris and New York enable us to sell any kind of Hats at least fifteen per cent cheaper than any of our competitors.

Mr. M., having had some very superior MOLESKIN FLUSHES manufactured expressly for him at Lyons, is prepared to produce a finer MOLE HAT than was ever before manufactured. Our prices are:

No.	1	2	3	4	5	6	7	8	9	10
No. 1	Extra Super Mole Skin Hat, made to order,	\$8								
No. 2	" " " " " "	6								
No. 3	" " " " " "	6								
No. 4	Imported " " " " "	4								

Meussdorffer's stock of SOFT HATS, CAPS and STRAW HATS, is the largest in the State, and receives additions of the newest styles by every steamer from Paris and New York.

Every one and all,
Please give us a call,

—AT—

MEUSSDORFFER'S HAT MANUFACTORY,

635 and 637 Commercial street (Old Number, 163).

and says some ugly things. Tut! dear Rabbi; we shall make the amende honorable. The True Pacific Messenger is at this time the best Jewish literary publication on the continent!

SUMMARY OF MINING NEWS.

WASHOE.—It is established that valuable mines have been found in the foothills about Washoe Valley. Washoe Valley is some distance from the celebrated mines, and until recently has shown no "indications," although from it the silver region took its name. A very extensive ditch is in progress of construction, and a new road has been made to Esmeralda.

NEW INCORPORATION.—The Alhambra Mining Company have filed a certificate of incorporation in the County Clerk's office. It purports carrying on mining operations in Silver City, Carson county, Nevada Territory. The capital stock of the Company is to be \$100,000, to be divided into two thousand shares of fifty dollars each. The first Board of Trustees is to consist of H. Michels, John O. Stranch, T. L. Meyer, Juan M. Lucio and Francisco de Leon.

The Tulare silver mines are attracting much attention at the present time. An experienced miner who spent a portion of the past summer prospecting in that region, states, in his opinion, that the Coso mines will prove rich and extensive. He will start back in a few days.

A CHINA.—Ballard & Co.'s claim, on Hunt's Gulch, is a good one. While ground-sluicing last week, they picked up several pieces, one weighing nearly two ounces.

The Washoe Lake placer mines are now attracting a good deal of attention. One or two companies commenced sluicing last week, and though they had not cleaned up when our informant left, yet there was much cheering show of ore to be seen in their boxes. Other companies will commence operations soon. We expect reports from that locality shortly. These diggings are in Wisconsin District.—Washoe Times.

SILVER ORE.—The following is an easy test, says an exchange, for ascertaining whether a mineral contains silver: Put a small piece of the mineral on a shovel or stove, then drop it into nitric acid, and apply a solution of salt and water. If the mixture changes to a milky blue, the mineral contains silver. It is a cheap and easy way to test the matter.

Bartola Mill.

THESE works are situated just below the town, and are superintended by Mr. Brooks. Though this establishment is small, it is very compactly built, and capable of doing much more than one would at first suppose.

The main building, containing the engine, boiler and stamps, is eighteen by sixty-four feet, and the area of the amalgamating room is thirty by forty feet. Everything is constructed with an eye to convenience and economy of room.

The motive power consists of a very fine improved twenty horse power locomotive boiler, and a double-slide valve engine of eighteen horse power—the cylinder being one inch bore and two feet stroke.

They are running one of Bryant's improved four-stamp straight batteries, under which the ore is crushed in a wet state, at the rate of eight tons per day. They have a fine well of water, from which the boiler and amalgamators are supplied—thirty amalgamators, Bartola's process, crushing ore from the Potosi claim.

They have a blacksmith shop, etc., attached to their works, and every convenience for pursuing their business in the most economical manner. The superintendent and attaches of the establishment showed us every attention and gave us all the necessary information in relation to the works.—Washoe Times.

THE PRESS is a most excellent journal of science, art, mining, agricultural, manufactures, chemistry, inventions, etc. It is one of our best exchanges, and we add it to our list with the greatest pleasure.—*Id.*

Deutscher Naturwissenschaftlicher Verein.

(GERMAN SCIENTIFIC CLUB.)

WEDNESDAY EVENING, April, 24th, }
Society's Hall, Clay street, over the Merchants' Exchange. }
DR. ECKEL in the Chair. Minutes were read and accepted. Present Drs. Reigensburger, Lanzweert, (by invitation, Dr. Lüne, recently from the Atlantic States), Messrs. Schmidt, Rehn, (Secretary pro tem) B. Hens, H. Jordan, Michels, Silversmith, Wallich, Aug. R. moné, Rotherberg, George Lilientaine, and others. Dr. Lanzweert presented a fine specimen of silver ore from the Colorado mines, estimated to be valued at \$335 per ton, containing 75 per cent lead. A splendid collection of about 100 specimens butterflies, with a cursory description thereof, were donated by Mr. Behrens. Another donation by Dr. Eckel, of scientific works was presented to the Association. The business of the evening having been disposed of, the President in behalf of the Association requested Mr. Rehn, Mineralogical Curator to the Society, to give a dissertation upon some given specimen of ore from the cabinet. The discourse was listened to with great avidity, for which the President took it upon himself to thank Mr. Rehn in appropriate terms, on behalf of the members. Dr. Lanzweert promised to read a paper on the silk worm at the next meeting. Delighted with the intellectual discourses of the evening, the Society closed to meet again on Wednesday evening, previous to which, members were informed that a herbarium was in preparation.

California Academy of Sciences.

MONDAY, April 22, 1861.

COL. RANSOM in the Chair. Minutes of the last meeting were read and accepted. Present Dr. Eckel, (by invitation, Dr. Reigensburger), Dr. Kellogg, Dr. Frank, Secretary, Dr. B. H. Messrs. Bommer, Silversmith, Stevens, Nims, Hanks and Clayton. The application of Mr. Alfred Rising was accepted, and the usual Committee appointed. The President presented several specimens of coal from the Puzburg and Paecek claims, near Monte Diablo; a quantity of red clay from Red Bluff, and a chart or skeleton map of California, showing the lines of equal variation recently compiled and published by him. Mr. Hanks presented a small bottle containing ammonia salt, obtained on the Chincha Islands. Dr. Kellogg gave notice that he would read a description of a new species of onions "*Allium Asceps*," brought from Washoe by Mr. Andrew Veatch, and is now cultivated by Mr. H. G. Bommer, Botanist to the Academy. The same gentleman has also in preparation the Shasta species of onion, of which a dissertation will follow. The subject: "What uses exist in Botany?" was ably discussed. This matter has been recently agitated through the PRESS, especially with reference to our Geological Survey of this State. We refer our readers to an able exposition of his views, by Dr. Kellogg, elsewhere in our issue of to-day. All matters being disposed of, the Association adjourned.

HENRY G. HANKS,

HOUSE AND SIGN PAINTER,

AND DEALER IN

PAINTS, OILS, GLASS, PUTTY, BRUSHES, etc. etc.

VOL. III.

SAN FRANCISCO, SATURDAY, MAY 4, 1861.

NO 6

HEYNEMAN, PICK & CO.'S

Bensley Water Works.

Among the important acquisitions to the manufacturing institutions of this State, the annexed will be classed as one of the most valuable, and as its title indicates, the "Pioneer Woollen Factory." We have often alluded to the progress and importance of these institutions, and we are only too happy to present our readers with an illustration of the factory, which is beautifully situated on Black Point, North Beach. The buildings were erected for that purpose in 1859, and occupy an area of one hundred and twenty-five feet by fifty feet—two story fire-proof brick edifices, near Bensley's San Francisco water works. J. A. Angus, Esq., is the superintendent of the establishment, whose experience we are informed is extensive, having spent a number of years as superintendent at home in large woollen factories. Some forty operatives are now employed, who are turning out from one hundred to one hundred and twenty-five blankets, of various colors and qualities, a day. They do not, however, confine themselves to blankets woollen goods of every description are being manufactured. The factory is now complete, and most judiciously arranged for drying, weaving, dyeing, the most of which branches are conducted with steam-power. There are eight hundred spindles in active operation, and three sets of cards. All the machines are of the most recent and improved models and patents, working with the greatest rapidity and easiest manner imaginable. The amount of wool consumed averages about one thousand pounds a day. Messrs. Heyneman, Pick & Co., on California street, in this city, are the exclusive owners. Their enterprising spirit will ere long reap the pecuniary reward they are so justly entitled to. They have of late erected new machinery for manufacturing flannel tweeds, coatings and other woollen goods. We have noticed of late a material reduction in the shipment of woollen goods from Eastern markets, which is undoubtedly caused by the fact that the demands for such articles in California can be fully supplied by this factory, at the same rates as the imported goods, and at the same time of far superior quality.

Hayes' Park Pavilion.

GRAND preparations for the German May Fest, to be held on Sunday and Monday next, are being carried out. Messrs. Caler and Seidenstricker, the enterprising managers, have so far spared no expense in carrying out the design in making this fest the grandest ever attempted in this State.

SILVER AND GOLD IN EL DORADO.—The Central Californian says, "The excitement consequent upon the discovery of a rich gold and silver lode near Cox's Station, about twenty-eight miles from this city, still exists, and more extended and richer discoveries than those mentioned in the last Californian have since been made. We see no good reason why silver should not exist in as large quantities in this country as on the other side of the ridge."

RICH.—The California Company are now taking out ore that shows a large percentage of gold intermixed with the silver. It is as rich as could be desired.—*Terr. Ent.*

PIONEER SAN FRANCISCO WOOLLEN FACTORY.

PATENT HEMMER.—By the steamship before the last, Josiah Howell, of this city, received from Washington a patent for his newly invented Hemming Guide for sewing-machines. Speaking of this invention, the *Scientific American* says: "The invention relates to hemmers of the tubular kind. It consists in a certain construction of the tube of the hemmer in three pieces, whereby the hemmer is made adjustable to turn hems of various widths in a very simple manner, and without the complication of parts as found in adjustable hemmers of other construction." Heretofore sewing-machines have been provided with sets of hemming guides, but the advantage in Howell's patent is that the one guide answers for turning every width of hem. Its superiority is therefore apparent.

THE MINES STILL "GIVING OUT."—A friend from Timbuctoo informs us that the Union Company at that place cleaned up their sluices lately, after ten days' washing, and took out the handsome sum of \$4938. Such yields are common in these claims, so it appears that in mining as in national affairs, the Union and prosperity are synonymous. *Apped.*

EVERY day's work by the American Mining Company, is an improvement on the last. They are now engaged in carrying their ditch around the mountain side, in order to supply other companies. Next week it is supposed that fifteen or twenty companies will commence taking out the ore.

SAN JOSE RAILROAD.—It is said that ground will be broken about the 1st of May, near Redwood city, for the grading of the railroad from San Francisco and San Jose. Engineers are now engaged in locating the route through San Mateo county.

RICH diggings have been struck near Prairie City, Sacramento county, and have attracted hundreds of prospectors.

THE late rains have retarded mining operations in Grass Valley, to an amount not less than \$300,000.

THE Bensley Water Company have liberally reduced their rates for water. The Spring Valley Company have nine miles of pipe now afloat, and on the way here from Europe and the Atlantic States. The Bensley Company intends to relinquish the plumbing business at an early day, and confine itself to tapping and conveying water as far as the outside line of the side-walk, free of expense to the consumers. The Spring Valley Company are about to commence work on their great Lake Honda reservoir, covering five acres of ground, and being fifty feet deep. Before long San Francisco will have water enough to drown the city out, in case such an aqueous necessity should arise.

We have in course of preparation a diagram, showing the main pipes as laid together with some interesting details of the whole works, management and progress. This enterprising company have reduced the rate of water twenty-five per cent., and as will be seen in advertisement elsewhere in our columns.

CALIFORNIA AND THE WORLD'S FAIR.—The following resolution has been adopted by the Assembly, and referred to the Committee on Mines and Mining Interests in the Senate:

Resolved, By the Assembly, the Senate concurring, That the State Geologist be and he is hereby authorized to open a correspondence with the managers of the Great Exhibition of Arts and Manufactures of all Nations, which is to be held in London in 1862, and in other ways to inform himself as to the propriety and advantages of having the State of California represented at that Exhibition by a collection of ores, minerals and agricultural products; also, that the State Geologist be requested to communicate the results of this correspondence to the Governor, who shall lay the same before the next Legislature at as early a period in the session as practicable.

GOLD ON THE HUMBOLDT.—Sam Davis, who is constructing a station at Edwards' Creek, on the overland route, lately showed us some specimens of gold, weighing half an ounce each. The specimens had been pounded between rocks to disengage the quartz, by the Indians, from whom Mr. Davis obtained them. He says that the Indians procured the gold about one hundred and fifty miles north of his station, but thinks it would hardly be safe for small parties to go out there unless they are acquainted with the Indians.—*Ter. Enterprise.*

A correspondent of the *Colonist*, writing from Fort Hope, under date of April 13th, says: Gold has been discovered on creeks flowing into Okanagan Lake near the boundary line. I hear on good authority that John McDougall, a half-breed, went on a prospecting tour this winter in the neighborhood of the lake and obtained twenty-five cents to a shovelful of dirt taken from the bed of a creek. He also took out a piece worth fifty cents from the second shovel. The baaks were frozen hard and he could not prospect them.

To Explorers, Discoverers, Prospectors, and Miners, on the Pacific Coast.

Parting by Nitric Acid.—The first step employed is quartation, which consists in fusing three parts of silver with one of the gold; for to ensure success, the silver must be to the gold as three to one. The alloy must next be granulated by melting it in a crucible, pouring it into cold water and stirring it briskly. It is then put into vessels of a pear-shape, about twelve inches long and seven wide at the bottom, with twice its weight of nitric acid (aqua fortis). The vessels are then gently heated on a sand-bath, and when the action has ceased, the liquor is to be poured off and more acid added. The gold left is washed with tepid water, until the liquor which comes off does not stain a piece of copper. It is then fused in a crucible with borax and niter. The silver in the liquor may be recovered by putting in a piece of pure copper.

Centrated Parting or Cementation.—The alloy is first beaten into thin plates, and placed in alternate layers in a pot, with a cement composed of four parts of bricks powdered and sifted; of one part of copperas calcined till it becomes red; and of one part of common salt: this is made into a thick paste with a little water. The whole is covered with a lid and luted, and then exposed to heat, until a great part of the alloying metals are removed. This will take twenty-four hours, but the heat must not be raised so as to melt the gold. If it is not sufficiently pure, it is cemented a second time. This process is chiefly used to extract silver from the surface of gold.

Dry Parting or Fusion.—The alloy is first melted and granulated. About seven-eighths of it are then mixed with about one eighth of the flowers of sulphur, and the mixture heated in a covered crucible, first slowly, and afterwards till the whole is brought into fusion, in which state it is kept on the fire for an hour; one-third of the alloy reserved is then added and thoroughly stirred with it by means of a wooden rod, and the whole is again heated for about an hour. Another third of the alloy is then mixed with it, and after a similar operation the remainder is added, and the mixture kept fused for three hours, during which it is frequently stirred. When the surface has become quite white, it is then poured into greased cones. When cold, the upper part will be found to be sulphureted of silver, and the lower a metallic button composed of gold and silver. If the former contains gold, it must be heated in an open crucible. The metal is repeatedly subjected to the same process; and the gold is thus concentrated into a smaller part, so that it may be parted by aqua fortis without too much expense.

When the gold is found mixed with sand or gravel only, it may be separated by washing; a process in which advantage is taken of the difference of specific gravity. It is sometimes performed by hand, in wooden vessels or troughs, which cross a current of water; and sometimes, if the ore is rich and valuable, upon inclined tables, covered with cloth. The metal sinks first, while the stony matter, which is lighter, is carried farther down the current. A decided improvement on this has been made by a European, and patented in 1844. In this process the gold, with its impurities, is subjected to the combined action of two currents of water—one vertical and the other horizontal; the former carrying the impurities above the level of the metallic particles, and the latter washing them away. The apparatus consists of a series of sieves separated by partitions, and surrounded by a casing with a valve opening upwards, and placed at one end of the series. The materials are dropped into the first sieve of the series from the hopper above, adapted to the delivery in given quantities, and the sieves then receive a vertical reciprocating movement in a water tank. On the descent of the sieves, the water passes through the meshes of the sieve and the valve; the former producing the vertical current, loosening the lighter and impure particles, and carrying them above the partitions; and the latter, the horizontal current, washing all that has been carried above the partitions to the next sieve, and so on to the end of the series, to catch the particles of gold that may have been carried up with the impurities.

Assaying.—Reduce the ore to powder, mix it with four parts, by weight, of dry caustic potash and one of fused borax, and subject it to heat in a silver crucible. When fused, pour it out, and if any remains in the vessel, remove it by muriatic acid. Digest this with the fused matter reduced to powder in muriatic acid, to which from time to time add a little alic acid. When the action ceases, pour off the solution, and wash well with water the residue, the washings being mixed with the solution. To the solution add copperas until no precipitate falls, wash the precipitate and fuse it in a crucible with half its weight of niter and a little borax, when a button of pure gold will be found at the bottom.

Iron pyrites containing gold is analyzed by digesting the ore in muriatic acid, with the addition of a little aqua fortis. What is left is roasted to drive off the sulphur, and again digested in acid. The solutions obtained must be neutralized by potash, and proto-nitrate of mercury is added. The precipitate thrown down is then fused with niter, by which the gold is procured. If there be silver in the ore, it is obtained by treating that part of it not acted upon by the acid with caustic, potash and muriatic acid. Lead ore containing gold is analyzed by digesting it in aqua regia, evaporating the solution, and then adding proto-nitrate of mercury. The part insoluble, when treated as above, will yield the silver in a pure state.

The assay of the alloys of gold will be treated under article Silver.

The process of assaying in the dry way consists in melting

the gold with lead in a cupel, when the lead, combining with the other metals the gold contained, sinks into the substance of the cupel, leaving the gold on the surface. Gold dust is thus assayed.

External Characters.—Color, golden or orange yellow, passing into grayish yellow; in some varieties inclines to brass-yellow. Seldom occurs massive, often disseminated, capillary, amorphous, dendritic, and crystallized in cubes, octahedrons, rhomboidal dodecahedrons, and tetrahedrons. Internally, shining, glistening and metallic. Fracture, hackly. Tessular. No cleavage. Soft, malleable, ductile, tenacious. Specific gravity = 19.26 to 19.5.

Chemical Characters.—Unaltered by exposure to air, moisture or acids. Soluble in aqua regia. Fusible with the blow-pipe. Melts at 2160° Fahrenheit.

Distinctive Characters.—Gold is the only metal which has a yellow color. Its malleability will distinguish it from iron and copper pyrites, and from yellow mica, for each of which it is often foolishly mistaken.

The gold of Africa is often adulterated with these pyrites and brass filings. This fraud may easily be detected by throwing the dust into aqua fortis, which dissolves the substances and leaves the gold untouched.

2.—PLATINUM.—Geognostic Situation.—This metal occurs only in the metallic state, associated or combined with various metals, as copper, iron, lead, gold, silver. It is frequently disseminated in rocks of igneous origin, as the primary. It is often found in sienite, associated with gold. But it occurs principally in alluvium or drift.

Extraction.—The grains must be first spread on a table, and a current of air from a bellows passed obliquely over them. By this the lighter particles, as quartz and iron ore, are removed. The crude metal is then dissolved in aqua regia, and a solution of sal-ammoniac added. The precipitate is then exposed to heat. The fine powder thus obtained is subjected to violent pressure in a brass tube. It is then heated to the highest temperature of a smith's forge, and carefully hammered. After this operation it is coated with a reddish crust, which is removed by covering it with borax and exposing it to a white heat; it is then washed with muriatic acid, which leaves the metal resplendent.

Sometimes the grains contain a little gold. This may be separated by dissolving them in aqua regia. To the solution add copperas, and fuse the precipitate with niter and borax.

Assaying.—Digest in a retort one hundred grains with ten times its weight of aqua regia; apply the heat of a lamp till half of the acid passes over into the receiver; decant the fluid remaining, and repeat the process with acid. Filter. To the solution add a solution of sal-ammoniac; wash and dry the precipitate. Heat in a crucible until all fumes cease. The weight of the spongy mass will show the percentage of the metal.

External Characters.—Color, very light steel-gray, approaching to silver-white. Occurs in grains and rolled pieces, seldom larger than a pea, and resembling coarse iron filings. Roundish. Shining and glistening. Streak unchanged. Hardness nearly equal to that of iron. Malleable; ductile. Structure sometimes lamellar, but often not obvious. Specific gravity. = 20.98.

Chemical Characters.—Insoluble in the hottest furnaces, but melts before the compound blow-pipe. Unaltered by exposure to air, moisture or acids. Dissolves in aqua regia.

3.—SILVER.—Geognostic Situation.—This metal is found mostly in primary and secondary slates. It is found native, also combined with sulphur and muriatic acid. It likewise occurs in the metallic state, mixed with copper, antimony, lead, arsenic, gold. The rocks richest in it are gneiss, mica slate, clay-slate, graywacke.

Extraction.—Silver is extracted from its ores by amalgamation and fusion. The first process is followed when the ore is rich in silver, the latter when it contains little.

Amalgamation.—The ore, being freed as much as possible from its stony ingredients, is mixed with common salt, in the proportion of nine to ten per cent. It is then exposed for some hours on the floor of a reverberatory, till the vapor ceases to come off; the mixture being frequently stirred. When the matter is cold it is reduced to powder in a mill, and mixed with an equal quantity of quicksilver. The amalgamation may be performed in barrels, which are made to revolve. The mixture being put into these vessels it is made into a thick paste with water, and kept agitated for about forty-eight hours; and when the amalgam has fallen to the bottom, it is withdrawn through an aperture. The remainder is then washed to get more of the amalgam, and the residual matter roasted with about three per cent of sulphur, and subjected to a similar process. The amalgam is squeezed in a leather bag to remove the superfluous mercury, and then subjected to distillation.

Fusion.—The ore generally subjected to this process is lead glance. It is first subjected to stamping and washing, then roasted in a reverberatory, the heat not being raised so much as to melt it; and when it begins to adhere together on its surface it must be well stirred. In five or six hours, the flame changes from blue to white; charcoal in powder is then thrown in, by which part of the lead collects at the bottom. When enough is formed, quicksilver is mixed with the scoria to thicken it, and the fused metal is drawn off. After this the heat is continued, and the metal is taken out as it is formed, the temperature being increased. The metal as it is collected is covered with charcoal, and the scoria removed. It is then covered with sawdust, pieces of wood, and a little resin, and constantly stirred. When the flame

ceases it is poured into moulds. It is then subjected to cupellation, as described under article Gold.

When the ore contains copper, it is mixed with another ore containing silver, iron, and sulphur, and with the scoria of a former process. The mixture is fused in a blast furnace. The matter, during cooling, separates; that below is roasted to expel the sulphur and arsenic, and to rust the iron. It is then mixed with one and a half of rich ore and some scoria, and is fused. The metallic matter obtained is again roasted, and fused with about one half of litharge and as much scoria. When cold it separates into three parts; the second, containing copper and silver, is melted with lead and copper scoria, afterwards with litharge and scoria. If it is not pure, then it must be repeatedly fused.

Assaying.—The method of examining the purity of silver is by mixing with lead, and is the same as cupellation. The ore must first be roasted, and then mixed with litharge and quickly fused. The product is then fused with black flux; the metallic button which falls is mixed with the proper quantity of lead and placed in the cupel.

Assay of Gold Alloyed with Silver.—The alloy being mixed with the due proportions of lead and silver (the latter amounting to three times the quantity of gold) is placed in a muffle, and the cupellation performed as above. When the process is finished the button of metal is taken out, and kept in a state of fusion in a crucible for some time, by which the lead is expelled. When cold, it is beaten into a plate, again made red hot, and slowly cooled. It is afterwards extended into a thin leaf between steel rollers, and coiled loosely up, in which state it is submitted to the process of parting, described above. The quantity of lead added in the alloy should be forty parts to three of silver. In the cupellation there is little risk of making the heat too high.

The best mode of separating copper and silver is to throw the article in a glazed earthenware dish, in which one pound of niter is dissolved in nine pounds of oil of vitriol, with the aid of a little heat. The heat is then raised to about 200°. When the silver is dissolved the fluid is poured off, and the metal is precipitated by common salt, and obtained in the usual way, or the solution is diluted with water, and pieces of pure copper are immersed in it.

[To be Continued.]

Lord Bacon's "New Philosophy."

THE claim of this wonderful man to rank as a discoverer in science will scarcely be allowed by those who question the title of his predecessor, and, in some respects, prototype, Roger Bacon, to that distinguished honor. Nevertheless, Francis Bacon, Lord Verulam, "by his hours of leisure, by time hardly missed from the laborious study and practice of the law, and from the assiduities of a courtier's life," became the father of modern science, and will be justly looked upon in all future ages as the great reformer of philosophy. His own actual contributions to the stock of physical truths were small; and his observations and experiments in physical science, viewed beside the results obtained by his immediate successors, do not appear to great advantage; nor can we compare them at all with the brilliant discoveries of his contemporary, Galileo. It is only when viewed in reference to the general state of knowledge in his own times that Bacon's recorded experiments and observations can be fairly estimated. To glance at these characteristics of his philosophic mind, and at the effect of his labors, rather than detail the labors themselves, is all that can be here attempted.

Francis Bacon was born in York House, on the south side of the Strand, in 1561. His health was very delicate; and to this circumstance may be partly attributed to that gravity of carriage, and that love of sedentary pursuits, which distinguished him from other boys. We are told that while still a mere child he stole away from his play fellows to a vault in St. James's Fields for the purpose of investigating the cause of a singular echo which he had observed there. It is certain that at only twelve years of age he busied himself with very ingenious speculations on the art of legerdemain; a subject which, as Professor Dugald Stewart has most justly observed, merits much more attention from philosophers than it has ever received.

In his thirteenth year, Bacon was sent to the Trinity College, Cambridge, where he studied with diligence and success. Dr. Rawley, his chaplain and biographer, relates that "while he was comorant at the University, about sixteen years of age (as his lordship hath been pleased to impart unto myself), he first fell into the dislike of the philosophy of Aristotle—not for the worthlessness of the author, to whom he would ever ascribe all high attributes, but for the untruthfulness of the way—being a philosophy (as his lordship used to say) only strong for disputations and contentions, but barren of the production of works for the life of man; in which mind he continued to his dying day." Thus early Bacon is said to have planned that great intellectual revolution with which his name is inseparably connected.

In his great work on the *Instauratio of the Sciences*, he first made a survey of knowledge as it then existed. In its second part, the *Novum Organum*, in the first book, the main object of science is pointed out, its true end being "to enrich human life with new discoveries and wealth." In the second book Bacon explains the mode of studying nature which he proposed for the advancement of science. The last division includes the use of instruments in aiding the senses, in subjecting objects to alteration for the purpose of observing them better, and in the production of that alliance of knowledge and power which has, in our day, crowded every

port of civilized life with the most useful inventions. The great merit of Bacon undoubtedly consists in the systematic method which he laid down for prosecuting philosophical investigation; and at the present day, those especially who busy themselves with physical pursuits, would often do well to recur to the severe and rigorous principles of the *Organum*. Experience and observation are the guides through the Baconian philosophy, by which its author so largely contributed to the existing knowledge in matters of fact. Of his foreseeing anticipation, we quote an instance. Bacon, after remarking that every change and every motion requires time, has the following very curious anticipation of facts which appeared then doubtful, but which subsequent discovery has ascertained:

"The consideration of these things produced in me a doubt altogether astonishing, namely, whether the face of the serene and starry heavens be seen at the instant it really exists, or not till some time later; and whether there be not, with respect to the heavenly bodies, a true time and an apparent time, no less than a true place and an apparent place, as astronomers say, on account of the parallax. For it seems incredible that the species or rays of the celestial bodies can pass through the immense interval between them and us in an instant, or that they do not even require some considerable portion of time."

"The measurement of the velocity of light," Professor Playfair subjoins, "and the wonderful consequences arising from it, are the best commentaries on this passage and the highest eulogy on its author."

It must not be forgotten how much is due for the foundation of the Royal Society to Lord Bacon, who died only thirty-six years before its incorporation. In his *Novum Organum*, rejecting syllogism as a mere instrument of disputation, and putting no trust in the hypothetical system of ancient philosophy, he recommends the more slow but satisfactory method of induction, which subjects natural objects to the test of observation and experience, and subdues nature by experiment and inquiry; and "it will be seen how rigidly the early Fellows of the Royal Society followed Bacon's advice." It is, however, in his *New Atlantis* that we have the plan of such an institution distinctly set forth; and Sprat considered that there should have been no other preface to his account of the Royal Society than some of Bacon's writings.

After the glory of Bacon had set forever, and his name had become tarnished with infamy, he was stripped of his offices, banished from the court, heavily fined and imprisoned; but then, discharged and his sentence commuted, his ruined fortunes were never repaired; and the record of his frauds, deceits, impostures, bribes, corruptions and other malpractices, is one of the blackest pages in history. He passed the remainder of his days in the society of the few friends whom adversity had left him. Scientific pursuits were his consolation and at last caused his death. The father of experimental philosophy was the martyr of an experiment. It had occurred to him that snow might be used with advantage for the purpose of preventing animal substances from putrefying. On a very cold day, early in the spring of the year 1626, he alighted from his coach near Highgate in order to try the experiment. He went into a cottage, bought a fowl, and with his own hands stuffed it with snow. While thus engaged he felt a sudden chill, and was soon so much indisposed that it was impossible for him to return to Gray's Inn. The Earl of Arundel, with whom he was well acquainted, had a house at Highgate. To that house Bacon was carried. The Earl was absent; but the servants who were in charge of the place showed great respect and attention to the illustrious guest. Here, after an illness of about a week, expired early on the morning of Easter Day, 1626. His mind appears to have retained its strength and liveliness to the end. He did not forget the fowl which had caused his death. In the last letter that he ever wrote, with fingers which, as he said, could not steadily hold a pen, he did not omit to mention that the experiment of the snow had succeeded "excellently well." In this letter Bacon calls himself the "martyr of science," and compares himself to Pliny the elder, whose death was caused by his over-zealous observation of Mount Vesuvius. In his will, Lord Bacon "expressed, with singular brevity, energy, dignity and pathos, a mournful consciousness that his actions had not been such as to entitle him to the esteem of those under whose observation his life had been passed, and at the same time, a proud confidence that his writings had secured for him a high and permanent place among the benefactors of mankind. So at least we understood those striking words which have been often quoted, but which we must quote once more: 'For my name and memory, I leave it to men's charitable speeches and to foreign nations and to the next age.'

"His confidence was just. From the day of his death his fame has been constantly and steadily progressing; and we have no doubt that his name will be named with reverence to the latest ages, and to the remotest ends of the civilized world."

The great practical value of the benefits which have resulted from the Baconian philosophy has been thus eloquently illustrated by Lord Macaulay:

"Ask a fullwar of Bacon what the New Philosophy, as it was called in the reign of Charles II., has effected for mankind, and his answer is ready: 'It has lengthened life; it has mitigated pain; it has extinguished diseases; it has increased the fertility of the soil: it has given new securities to the mariner; it has furnished new arms to the warrior; it has spanned great rivers and estuaries with bridges of form

unknown to our fathers; it has lighted up the night with the splendor of the day; it has extended the range of human vision; it has multiplied the power of human muscles; it has accelerated motion; it has annihilated distance; it has facilitated intercourse, correspondence, all friendly offices, all dispatch of business; it has enabled man to descend to the depths of the sea, to soar into the air, to penetrate securely into the noxious recesses of the earth, to traverse the land in cars which whirl along without horses, and the ocean in ships which run ten knots an hour against the wind. These are but a part of its fruits, and of its first-fruits; for it is a philosophy which never rests, which has never attained, which is never perfect. Its law is progress. A point which yesterday was invisible is its goal to-day, and will be its starting post to-morrow."

The same brilliant writer denominates the two leading principles of the Baconian philosophy to be *utility* and *progress*, of which there cannot be more direct evidence than in the fact that the writings of Lord Bacon have been more extensively read in England during the last forty years than the two hundred years which preceded.

New Patent Law.

AN ACT in addition to "An act to promote the progress of the useful arts."

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Commissioner of Patents may establish rules for taking affidavits and depositions required in cases pending in the Patent Office, and such affidavits and depositions may be taken before any justice of the peace or other officer authorized by law to take depositions to be used in the courts of the United States, or in the State courts of any State where such officer shall reside; and in any contested case pending in the Patent Office it shall be lawful for the clerk of any court of the United States for any district or territory, and he is hereby required, upon the application of any party to such contested case, or the agent or attorney of such party to issue subpoenas for any witnesses residing or being within the said district or territory, commanding such witnesses to appear and testify before any justice of the peace, or other officer as aforesaid, residing within the said district or territory, at any time and place in the subpoena to be stated; and if any witness, after being duly served with such subpoena shall refuse or neglect to appear, or, after appearing, shall refuse to testify (not being privileged from giving testimony), such refusal or neglect being proved to the satisfaction of any judge of the court whose clerk shall have issued such subpoena, said judge may thereupon proceed to enforce obedience to the process, or to punish the disobedience in like manner as any court of the United States may do in case of disobedience to process of subpoena *ad testificandum* issued by such court; and witnesses in such cases shall be allowed the same compensation as is allowed to witnesses attending the courts of the United States; provided, that no witness shall be required to attend more than forty miles from the place where the subpoena shall be served upon him to give a deposition under this law; provided, also, that no witness shall be deemed guilty of contempt for refusing to disclose any secret invention made or owned by him; and provided, further, that no witness shall be deemed guilty of contempt for disobeying any subpoena directed to him by virtue of this act, unless his fees for going to, returning from, and one day's attendance at the place of examination shall be paid or tendered to him at the time of the service of the subpoena.

Sec. 2. And be it further enacted, that for the purpose of securing greater uniformity of action in the grant and refusal of letters patent, there shall be appointed by the President, by, and with the advice and consent of the Senate, three examiners-in-chief, at an annual salary of three thousand dollars each, to be composed of persons of competent legal knowledge and scientific ability, whose duty it shall be, on the written petition of the applicant for that purpose being filed, to revise and determine upon the validity of decisions made by examiners when adverse to the grant of the letters patent; and also to revise and determine in like manner upon the validity of the decisions of examiners in interference cases, and when required by the Commissioner in applications for the extension of patents, and to perform such other duties as may be assigned to them by the commissioner; that from their decisions appeals may be taken to the Commissioner of Patents in person, upon payment of the fee hereinafter prescribed; that the examiners-in-chief shall be governed in their action by the rules to be prescribed by the Commissioner of Patents.

Sec. 3. And be it further enacted, that an appeal shall be allowed to the examiners-in-chief from the decisions of the primary examiners, except in interference cases, until after the application shall have been twice rejected; and the second examination of the application by the primary examiner shall not be had until the applicant, in view of the references given on the first rejection, shall have renewed the oath of invention, as provided for in the seventh section of the act entitled "An act to promote the progress of the useful arts, and to repeal all acts and parts of acts heretofore made for that purpose," approved July 4th, 1836.

Sec. 4. And be it further enacted, that the salary of the Commissioner of Patents, from and after the passage of this act, shall be four thousand five hundred dollars per annum, and the salary of the chief clerk of the Patent Office shall be two thousand five hundred dollars, and the salary of the librarian of the Patent Office shall be eighteen hundred dollars.

Sec. 5. Be it further enacted, that the Commissioner of

Patents is authorized to restore to the respective applicants, or, when not removed by them, to otherwise dispose of such of the models belonging to rejected applications as he shall not think it necessary to be preserved. The same authority is also given in relation to all models accompanying applications for designs. He is further authorized to dispense in future with models of designs when the design can be sufficiently represented by a drawing.

Sec. 6. And be it further enacted, that the tenth section of the act approved the 3rd of March, 1837, authorizing the appointment of agents for the transportation of models and specimens to the patent office, is hereby repealed.

Sec. 7. And be it further enacted, that the Commissioner is further authorized, from time to time, to appoint, in the manner already provided for by law, such an additional number of principal examiners, first assistant examiners, and second assistant examiners, as may be required to transact the current business of the office with dispatch, provided the whole number of additional examiners shall not exceed four of each class, and that the total annual expenses of the patent office shall not exceed the annual receipts.

Sec. 8. And be it further enacted, that the Commissioner may require all papers filed in the Patent Office, if not correctly, legibly, and clearly written, to be printed at the cost of the parties filing such papers; and for gross misconduct he may refuse to recognize any person as a patent agent, either generally or in any particular case; but the reasons of the Commissioner for such refusal shall be duly recorded, and subject to the approval of the President of the United States.

Sec. 9. And be it further enacted, that no money paid as a fee on any application for a patent after the passage of this act shall be withdrawn or refunded, nor shall the fee paid on filing a caveat be considered as part of the sum required to be paid on filing a subsequent application for a patent for the same invention.

That the three months' notice given to any inventor, in pursuance of the requirements of the twelfth section of the act of July 4th, 1836, shall be computed from the day on which such notice is deposited in the post office at Washington, with the regular time for the transmission of the same added thereto, which time shall be endorsed on the notice; and that so much of the thirteenth section of the act of Congress, approved July 4th, 1836, as authorizes the annexing to letters patent of the description and specification of additional improvements, is hereby repealed, and in all cases where additional improvements would now be admissible independent patents, must be applied for.

Sec. 10. And be it further enacted, that all laws now in force fixing the rates of the Patent Office fee to be paid, and discriminating between the inhabitants of the United States, are hereby repealed, and in their stead the following rates are established:

- On filing each caveat, ten dollars.
- On filing each original application for a patent except for a design, fifteen dollars.
- On issuing each original patent, twenty dollars.
- On every appeal from the examiners-in-chief to the Commissioner, twenty dollars.
- On every application for the re-issue of a patent, thirty dollars.
- On every application for the extension of a patent, fifty dollars; and fifty dollars, in addition, on the granting of every extension.
- On filing each disclaimer, ten dollars.
- For certified copies of patents and other papers, ten cents for one hundred words.
- For recording every assignment, agreement, power of attorney, and other papers, of three hundred words or under, one dollar.
- For recording every assignment and other papers over three hundred and under one thousand words, two dollars.
- For recording every assignment or other writing, if over one thousand words, three dollars.
- For copies of drawings, the reasonable cost of making the same.

Sec. 11. And be it further enacted, that any citizen or citizeness, or alien or aliens, having resided one year in the United States, and taken the oath of his or their intention to become a citizen or citizens, who, by his, or her, or their own industry, genius, efforts, or expense, may have invented or produced any new and original design for a manufacture, whether of metal or other material or materials, and original design for a bust, statue, or bass relief, or composition in alto or basso-relievo, or any new and original impression or ornament, or to be placed on any article of manufacture, the same being formed in marble or other material, or any new or useful pattern, or print, or picture, to be either worked into or worked on, or printed, or painted, or cast, or otherwise fixed on any article of manufacture, or any new and original shape or configuration of any article of manufacture, not known or used by others before his, her, or their invention or production thereof, and prior to the time of his, her, or their application for a patent therefore, and who shall desire to obtain an exclusive property or right thereto to make, use, and sell, and vend the same, or copies of the same to others, by them to be made, used and sold, may make application in writing to the Commissioner of Patents expressing such desire; and the Commissioner, on due proceedings had, may grant a patent therefor, as in the case now of application for a patent, for the term of three and one-half years, or for the term of seven years, or for the term of fourteen years,

[Continued on sixth page.]

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAYMAY 4, 1861

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Our Traveling Correspondent.

THE patrons of the PRESS throughout the interior will be visited by our correspondent, Dr. J. G. Horton, who will henceforth take charge of the geological and mineralogical department of this journal, and is for that special purpose making the tour throughout this State, Washoe and Esmeralda. The doctor will give his attention to the surveys of all mining regions, and report correct data, descriptions and details. We hope that every facility and attention may be shown him, that he may accomplish this arduous task. The doctor will also disseminate the MINING AND SCIENTIFIC PRESS among the mining community, and obtain such patronage in the subscription, advertising, engravings and illustrations, applications for patents, caveats, etc., as may be intrusted to him, and to be executed by us. Our facilities for job work and book printing are now complete, and shall be pleased to hear through Dr. Horton of many commissions in that department. Our interior cotemporaries and friends who will receive him kindly, we will some day reciprocate the compliment.

California's Future.

THE impending crisis is deeply deplored by every citizen, and being on this coast, and in many of our sister States on the Atlantic side, bringing, as it does, war, famine and destruction. Commerce, Arts and Science will thereby be thrown back and impaired to an almost irreparable extent, and it will take years of toil and labor to regain their original grandeur. The spirit of discord and disunion bears hard upon and pervades almost the whole American continent, and how to meet the catastrophe will trouble the keenest politicians who, we may assert, are the authors thereof. We are indeed gratified that so far California and the States and Territories generally on the Pacific have kept aloof from this striking and desperate cause. We are at peace with all the universe, and we pray the gods that they will strengthen us in the loyalty so quietly assumed. The slave question will, we trust, never be espoused by the people on this coast. We are surrounded and occupied by different interests and pursuits, which render California the Paradise of the world, where luxury, climate, society and peace reign.

Possessing all these attributes, besides a great field for the agriculturist, mechanic and manufacturer, we predict that California will see one of the greatest immigrations ever heralded, in a very short while. A new era will dawn, that will work miracles, throwing into the shade past wonders and accomplishments effected during the last twelve years.

Our extensive mineral and agricultural fields will find eager laborers to "pick and spade." Our commerce, coast-wise, with the Pacific Islands, China, Japan, East India, and Amoor River, will receive such an impetus as was never before equaled. Berkeley's adage:

"Westward the Star of Empire takes its way,"

is becoming verified. We would much rather see a spirit on the part of our Press in this State to apprise our sister States of these peculiar advantages than to indulge in hot headed Union or secession fire articles, which can little influence the affairs at home, or create a better feeling among the political factions in this State. Their common theme should be the future of California.

State Prison Labor.

THE attempt to procure the State prison laborers for manufacturing purposes by some of our factories has been laid aside by the Legislature, as is just and equitable. We are yet too young a State to have our mechanics and manufacturers, who have begun under difficulties and unfavorable circumstances, to be interfered with. In other States and countries the State prisoners are only allowed to make such articles which do not require apprenticeship of its operatives. The revenue derived from such a source would not be adequate to the injury of the tradesman or manufacturer, who pays taxes and assessments, or to cope in anywise with such formidable schemes, likely to undermine the tradesmen of our coast.

Boot and Shoe Factory.

THE PRESS has too often hinted the importance of the erection of a factory for the manufacture of boots and shoes. If some enterprising capitalist would but examine into the extent of these importations from the Atlantic States, he would find that much of the gold shipped home goes for these articles. An immense profit is made. The demand is constant. The materials are simple and easily obtained. We have several tanneries, and their leather bears comparison with any importations. Our hides are shipped to the East by some of our commercial houses, who pay a good price for them; they have traveling agents making collections of all raw materials, hides forming the chief bulk. The investment in a boot factory would, in our opinion, prove far more lucrative than any other manufacturing institution, and requires comparatively little machinery compared with other factories. A retrospective view of all those engaged in that business have, without a single exception, enriched themselves, as every citizen of several years' residence here will assert. We have upwards of 60,000 miners, and perhaps as many agriculturists in our State, all of which require from three to five pair of boots per annum—by far the greater part are importations. We know that they can be manufactured here, allowing that wages are higher here. Freight, insurance, time and exchange, will amount to more than the advance rate of wages.

Deutscher Naturwissenschaftlicher Verein.

(GERMAN SCIENTIFIC CLUB).

THURSDAY EVENING, May 2nd.
Society's Hall, Clay street, over the Merchants' Exchange.

AGREEABLE to a notice in the *Alta* to postpone the meeting of this association till Thursday evening at half-past seven o'clock, the following named members were called to order by President, Dr. Eckel in the chair. Messrs. Schmidt, Neuhaus (Sec.), Jordan, George, Silversmith, Erbe, and others. The minutes of last meeting were read and adopted. Mr. Otto Hasbach was presented for a resident member; upon a motion he was elected by acclamation. New additions to the cabinet were made by Messrs. Bauer and Schmidt. The promised essay on minerals, by Mr. Erbe, was postponed till the next meeting, but another subject on the poisonous colors in fabrics and flowers was approached and ably discussed. Mr. Schmidt read the proceedings of the scientific discourses for adoption. Dr. Eckel gave notice that he will at an early day read a paper on a new theory, established by a professor in Vienna, on Gravel and Kidney diseases, after which the association adjourned.

California Academy of Sciences.

MONDAY, April 29th.

THE members being called to order Mr. Bloomer was requested to preside. Present—the secretary, Dr. Trask, Dr. Eckel, Dr. Veatch, Dr. Ayer, Dr. Behr, and Dr. Kellogg, Messrs. Hanks, Boynton, Stivers, Dunn, Nevins and Silversmith. The minutes were read and accepted. Dr. Ayer placed upon the table a work received from Vienna, entitled the Geological Year-book. The following gentlemen subscribed funds for the purchase of seats:

Dr. Eckel \$2 50, Mr. Bloomer, \$1, Dr. Ayer, \$2 50, Mr. Stivers paid dues, \$2.

Dr. Ayer verbally communicated some facts pertaining to some new species of smelt, which he described, though by other curators specially classified and named, are now a specie belonging to a common family of fish.

Dr. Kellogg, botanical curator to the institute, read a description of a new plant entitled *Monolopia globrata*, or the smooth thimble cap—also, the *Allium attenuifolium*, the one brought from Washoe by Mr. Veatch. The business for the evening being finished the association adjourned.

MONTHLY PERIODICALS.—Rev. Dr. Scott's *Expositor* has come to us with excellent and choice literary articles. The *Hesperian*, by Mrs. Day, contains as usual its quantum of fashion, plates, etc. *Hutchins's Magazine* has not appeared yet. Mr. Pillsbury has kindly handed us the *Cal. Mountaineer*. It promises to succeed well and is deserving of commendation.

AN interior exchange mentions in connection with mining enterprise at Washoe and Esmeralda that Bryan's mill is destined to be the most important and practicable mill for crushing quartz. Many companies use it now, and others have ordered it, it being simple, durable and easily transported, and perhaps cheaper than most others.

Chloroform—Its Use and Utility.

In this article we are under promise to determine the constitutionality of a patient suitable to administer chloroform, after which the mode of administering it.

First, I hold that it is a great mistake with the public mind that but few can take it with impunity. Most of persons can take it, unless they are constitutionally impaired around the brain, with unnatural causes, such as excesses of venery, contusion of the head, causing a predisposition for coma, synchopie, epilepsy, etc. Any well regulated organism, with a proper balance of brain and vital tissue through the spinal column can take it. What is here determined or hinted at is that often males, and not unfrequently females, so far exhaust the vital and functional energies of the spinal column and cerebellum portion of the brain (hack part) that they are thrown out of the element and constitutionality of their being, from excesses of the above kind. Foreign agents, such as psychology, opiates, electricity, the odic forces of the earth, either laughing gas, chlorodyne, or chloroform, cannot be given with impunity to a constitution so impaired.

As a general rule or feature, such patients at once look cadaverous, become rigid, the vital organs become passive, and if in that state long, no doubt life would become extinct; from the simple fact that the principle and tenacity of life were so impaired by such excesses that there is no functional power in the organism sufficiently strong to hold life in the body while these agents act upon the sensations of organism.

The above described persons are generally those that the mesmeriser and psychologist generally select to induce a belief in their dogmas, while the weary and credulous are led to all manner of excitements, isms and injurious doctrines.

To such I would say, do not take chloroform, opium, or any such agent, but emancipate yourself from your excesses and with an iron will be determined to conquer and battle on until you succeed; or your excesses will drag you down, and your moral corruption will be tenfold greater than your physical pollution.

I have found in my practice that any well organized constitution and a properly-balanced head can take it at any and all times, if wisely and judiciously administered. If the patient is predisposed to plethora or biliary ailments, the only caution to be observed is not to administer too soon after a meal, and even then, if in the end it should create nausea, a slight emetic will counteract all unfavorable apprehensions.

In regard to a nervous patient, the more nervous, the greater the need of the patient being at once placed under its influence, from the fact that the functions and office proper for the cerebral as well as the lateral portion of the brain ceases in the application of fear; and while these functions are, for the time, subdued; the operation may be performed with success and impunity, whereas had the same operation been performed with entire consciousness, the excess of the patient's apprehension might have induced an exhibition of hysteria or frenzy that would have, no doubt, in many instances, proved most serious.

Many persons apprehend, that if they have a cough or diseased larynx or lungs, that they should not take it.

It is of great use as an internal remedy for the lungs, combined with tinct. opii, camphorated mixtures, and other preparations; and as I remarked in my preceding article, it is rapidly coming into use as a remedial agent, in the medical world.

The danger in its use as an agent to impair pain, has more to do with the brain than any other portion of the system, when, indeed, there is any possible danger.

A full volume of air should first be breathed into the lungs and chest. Just as the patient takes the seat or lies down to receive it, long and full breaths should be induced, that it may be well disseminated in the venous, as well as in the arterial blood, before it reaches the brain direct. By this mode, the transition of sensation is general and throughout the system, while the patient quietly becomes passive and unconscious, when the operator can proceed. The latter, whether dentist, surgeon or physician, should have full control of his own nerves, and be as cool and dispassionate as if he were reading a book or mending his quill pen. Then let him proceed.

I am at the present time giving from two to six pounds of it a week in my office on Third street, to ladies, children and men, extracting teeth and excising bone about the face and head, and have used it regularly for seven years in this climate, on some 2000 different persons, and as yet I have not to my knowledge known of any contingent or serious injury by using it; but, on the contrary, have universally been successful.

If the reader doubts the above, please to call and witness its administration at all hours in the office.

In my next article I will give you the mode and modes that different operators employ in the administration of chloroform.

W. H. IRWIN, M. D.

The Barometer: Torricelli and Pascal.

The invention of the Barometer is one of the most curious events in the history of philosophy. No new discovery, not even those substantiated by the telescope, ever knocked so hard at the door of a received system, or in a manner which so imperiously demanded admission. The circumstances attending it are briefly these:

The phenomena of the common pump had been well known for more than a century at least before the Christian era. The mode of explanation was simply the well-known maxim that "Nature abhors a vacuum;" but no attempt had been made to discover why. Sir John Herschel observes, that "if any such abhorrence existed, and had the force of an *acting cause* which could urge water a single foot into a pipe, there is no reason why the same principle should not carry it up two, three or any number of feet; none why it should suddenly stop at a certain height, and refuse to rise higher, however violent the suction might be—nay, even fall back, if purposely forced up too high."

It is related that the engineers of Cosmo de Medicis, wishing to raise water higher than thirty-two feet by means of a sucking-pump, they found it impossible to take it higher than thirty-one feet. Galileo, the Italian sage, was applied to in vain for a solution of the difficulty. It had been the belief of all ages that the water followed the piston from the horror which nature had of a vacuum; and Galileo improved the dogma* by telling the engineers that his horror was not felt, or at least not shown, beyond the heights of thirty-one feet! At his desire, however, his disciple, Torricelli, investigated the subject. He found that when the fluid raised was mercury, the horror of a vacuum did not extend beyond thirty inches, because the mercury would not rise to a greater height; and hence he concluded that a column of water thirty-one feet high, and one of mercury thirty inches, exerted the same pressure upon the same base, and that the antagonistic force which counterbalanced them must in both cases be the same; and having learned from Galileo that the air was a heavy fluid, he concluded and published the conclusion in 1645, that the weight of the air was the cause of the rise of water to thirty-one feet, and of mercury to thirty inches. He then filled a tube more than three feet long, and open at one end only, with mercury; and then, stopping the open end with the finger, he placed the tube in an open vessel of mercury, with the open end downward. On removing the finger, the mercury in the tube sunk until it stood in the tube at about twenty-eight inches higher than the mercury in the vessel. He thus constructed what is at this time considered the best form of the barometer.

In 1646, Pascal, the young philosopher of Clermont, repeated these experiments at Ronen, before more than 500 persons, among whom were five or six Jesuits of the college, and he obtained precisely the same results as Torricelli, with whose explanation, however, he did not become acquainted until the following year, when, assuming that the mercury in the Torricellian tube was suspended by the weight or pressure of the air, he suggested that it would necessarily fall in ascending a high mountain, by the diminution of the superincumbent column of air. At his request, his relative, M. Perrier, tried the barometer at the summit and the base of the mountain of Puy de Dome, in Auvergne; the result was, that the mercury which, at the base, stood twenty-six and a quarter inches (French), was only twenty-three and a sixth inches at the summit. Pascal afterward found the same result sensibly shown in the ascent of a church tower and of a private house.

After this important experiment was made, Pascal intimated that different states of the weather would occasion differences in the barometer, according as it was cold, hot, dry or moist; and M. Perrier tested this opinion by observations made at Clermont from 1649 to 1651. Corresponding observations were made at the same time at Paris and at Stockholm; and from these it appeared that the mercury rises in cold, cloudy and damp weather, and falls when the weather is hot and dry, and during rain and snow; but still with such irregularities, that no general rule could be established. At Clermont, the difference between the highest and lowest state of the mercury was one inch three and a half lines; at Paris the same; and at Stockholm, two inches two and a quarter lines.

The discovery was, however, at first much misconceived, and even disputed, till the question was finally decided by an appeal to a *crucial instance*; one of the first, if not the very first, on record in physics. "It was then seen," says Sir John Herschel, "as by a *glaring instance*, that the maintenance of the mercury in the tube was the effect of a perfectly definite external cause, while its fluctuations from day to day, with the varying state of the atmosphere, fifteen pounds on every square inch, that pushes water into the void left by the up-drawn piston of a pump; and there is, of course, a limit beyond which it cannot push the water, viz., the point of height at which the column of water in the pump-tube is exactly balanced by the weight of the atmosphere. It is just a question of balance; fifteen pounds can only support fifteen pounds—a thing which everybody now understands, thanks to Galileo, Torricelli and Blaise Pascal, the seer, the discoverer and verifier of the fact.

Pascal evinced such early eagacity, that, at the age of eleven, he was ambitious of teaching as well as learning; and he then composed a little treatise on the refractions of sounds of vibrating bodies when touched by the finger. One day he was found alone in his chamber, tracing with

charcoal geometrical figures on the wall; and on another occasion he was surprised by his father just when he had succeeded in obtaining a demonstration of the thirty-second proposition of the first book of Euclid—that the three angles of a triangle are equal to two right angles. Astonished and overjoyed, his father rushed to his friend, M. Railleur, to announce the extraordinary fact; and the young geometer was instantly permitted to study, unrestrained, the Elements of Euclid, of which he soon made himself master without any extrinsic aid. From the geometry of planes and solids he passed to the higher branches of the science; and before he was sixteen years of age he composed a treatise on the Conic Sections, which evinced the most extraordinary sagacity. When scarcely nineteen years of age, too, Pascal contrived a machine to assist his father in making the numerical calculations which his official duties in Upper Normandy required.

In later life, Pascal found researches in geometry an occupation well fitted to give serenity to a heart bleeding from the wounds of his beloved associates. He had for some time renounced the study of the sciences, when, during a violent attack of toothache, which deprived him of sleep, the subject of the cycloid forced itself upon his thoughts. Fernal, Roberval, and others had trodden the same ground before him; but in less than eighteen days, and under severe suffering, he discovered a general method of solving this class of problems by the summation of certain series; and as there was only one step from this discovery to that of Fluxions, Pascal might, with more leisure and better health, have won from Newton, and from Leibnitz the glory of that great invention.

Pascal's treatise on the weight of the whole mass of air forms the basis of the modern science of Pneumatics. In order to prove that the mass of air presses by its weight on all the bodies which it surrounds, and also that it is elastic and compressible, Pascal carried a halloo half filled with air to the top of the Puy de Dome. It gradually inflated itself as it ascended; and when it reached the summit it was quite full and swollen, as if fresh air had been blown into it, or, what is the same thing, it swelled in proportion as the weight of the column of air which pressed upon it was diminished. When again brought down, it became more and more flaccid; and when it reached the bottom, it resumed its original condition. In the above treatise, Pascal shows that all the phenomena and effects hitherto ascribed to the horror of a vacuum arise from the weight of a mass of air; and—after explaining the variable pressure of the atmosphere in different localities and in its different states, and the rise of water in pumps—he calculates that the whole mass of air round our globe weighs 8,983,889,440,000,000,000 French pounds.

Seeing that little more than two centuries have elapsed since the exposition of this great principle of hydrostatics was clearly established, we are not surprised to find that the science in the Dark Ages enabled the ancient magicians to impose upon their dupes with unimpeachable certainty. To name a few of the most celebrated instances: the magic cup of Tantalus, which he could never drink, though the beverage rose to his lips; the fountain in the island of Andros, which discharged wine for seven days, and water for the rest of the year; the fountain of oil, which burnt out to welcome the return of Augustus from the Sicilian war; the empty urns, which, at the annual feast of Bacchus, filled themselves with wine, to the astonishment of the assembled strangers; the glass tomb of Belus, which, after being emptied by Xerxes, could never again be filled; the weeping statues of the ancients, and the weeping virgin of modern times, whose tears were uncourtously stopped by Peter the Great when he discovered the trick; and the perpetual lamp of the ancient temples, were all the obvious effects of hydrostatical pressure.

PLACER MINING.—The discovery of placer diggings, in the foot hills adjacent to Washoe Valley, was announced some months since; since which time, numerous prospects, indicating good diggings, have been shown around our streets, without creating any excitement; perhaps we might say without inducing the belief that extensive placer diggings existed on the eastern slope. The company owning the ground, have, however, organized under the name of the American Mining Company, by electing Robert Logan, Foreman, and a Mr. Beard Treasurer. Last week the company got to work with three hands; the result of four days' work was twelve ounces, of as handsome gold as we have ever seen in California. One ounce a day to the hand, was esteemed good pay in California's best days, and in Nevada, with her untold mineral wealth such diggings are an addition not to be despised. It is to be hoped, that the American Company may find their claims as extensive as rich. Affording employment for the hundreds of idle hands that are laying around our towns waiting for something to turn up.

With real pleasure we place on our exchange list the MINING AND SCIENTIFIC PRESS of San Francisco. This is the only mining and scientific journal published on this side of the Pacific. Its pages abound with matter of the most important character to those engaged in mining and scientific pursuits. Subscribers can send their subscription, \$4 per annum, to J. Silversmith, editor and proprietor, at Government House, Rooms No. 20 and 21, San Francisco.—*San Francisco Gazette.*

Correspondence.

SAN FRANCISCO, May 1st, 1861.

EDITOR MINING AND SCIENTIFIC PRESS.—DEAR SIR:—In presenting another annual report of the Oregon fruit trade with San Francisco, we have little to offer further than a table showing the amount received during each month of the season, and the average price of sales. The first apples received were in the month of August, as follows:

August.....	490 boxes 5c. to 12½c.	per lb.....	Average 8c.
September.....	5271 " 4c. to 10c.	"	" 6½c.
October.....	9290 " 4½c. to 7c.	"	" 6½c.
November.....	15,350 " 5c. to 10c.	"	" 7c.
December.....	24,375 " 4c. to 9c.	"	" 6c.
January.....	8,249 " 5c. to 11c.	"	" 5c.
February.....	30,612 " 5c. to 11c.	"	" 7½c.
March.....	7,342 " 5c. to 11c.	"	" 7c.
April.....	4,736 " 5c. to 10c.	"	" 10c.
Total.....	85,914		

Making a total of nearly eighty-six thousand boxes, averaging 1½ bushels per box, equal to one hundred and seven thousand five hundred bushels, in the estimate. Cherries, plums, etc., which come in small quantities, are not included, as we took account only of apples received. The average sale of the whole crop is at six cents per pound, perhaps a little above that figure, so that the total value of sales is somewhat over \$300,000.

Notwithstanding the reports, and general belief of a short crop, and the fact, that in some localities fruit was mostly cut off by early frosts, the result shows 14,000 boxes more received here than the previous year; which is accounted for by the large year increase where 80 many young orchards are coming into bearing. There have been much improvement in the uniformity of size and style of the packages over former years.

During the early part of the season, it was well assorted and well packed, all small and inferior fruit having been rejected, and almost invariably arrived in fine condition.

By some shippers the same care and management was apparent throughout the shipping, and such invoices generally sold several cents above ordinary sales. Large quantities of Fall fruit was held back till December, with a view, probably, of obtaining better prices, which, coming in over-rapid and out of season, was sold for three cents per lb. less than the same fruit brought a month and six weeks earlier, besides considerable loss from decay. From about the 20th of November to the same time in December, there was received 30,000 boxes, an average of 1000 boxes daily, one-half of which was more than a month too late. The result was a glut in the market and a heavy decline in prices; occurring as it did just as the winter rains set in, rendering transportation in the interior both difficult and expensive. Had it come forward at its proper season it would have arrived in good order, and at a time when the roads in the interior were good, and the demand sufficient to have taken it, with little or no decline in prices.

Again, to render the former error still worse, fully one third of it was too small and inferior to send to any market.

Since the winter fruit commenced there has been much small, inferior, worthless trash received, which had better been left under the trees on which they grew, which has been one of the principal causes of depressed prices.

The crop of peaches, and other early fruits of California production, was large, and the market through the summer well supplied at moderate rates. Apples were brought to market before they were fairly ripened, to get them in before the Oregon fruit. Present appearances indicate a much larger fruit crop in California than any previous year, and a greater necessity will exist to send no inferior fruit.

Choice fruit will without doubt find ample market at remunerative prices. At no very distant day, however, Oregon must seek some other outlet for her fruit products. This city can now boast of green fruit the entire twelve months, and but few years will elapse, before it will be abundant and cheap at all seasons, and the produce of California soil.

Respectfully yours,

KNAPP, BURRELL & CO., 80 Washington st.

SANTIAM SILVER ORE.—A correspondent, writing to the *Oregonian*, speaking of the Santiam, Oregon, silver mines, says: "Some ore sent by me to California, has been assayed and found to contain silver, and an old and experienced miner (who discovered one of the best leads in Washoe, and sold the same for \$20,000,) sends me word, that if that was surface ore, the prospect is excellent, and he is anxious to come up and assist in opening the lead. The piece assayed is really from the surface, not two inches in, and I am determined to see further into it. Mr. Driggs, of Linn county, has gone with a person who has followed smelting in Mexico, to put up a furnace and commence work. And the first thing you may hear, may be news of rich leads opened and worked on the Santiam."

MINING ON HUMBURG.—During a recent visit to the above renowned locality, we were very agreeably surprised to witness the great amount of labor which has been performed in the way of ground sluicing during the past winter. If old Humburg does not yield a large amount of the ore, during the ensuing spring and summer, it will not be because her miners are indolent or underserving. We heard of only one company, that of Baltzell & Co., who, as yet, have begun to wash up. Though not fabulously rich, their prospects are flattering, they having taken out about eight hundred dollars in two weeks, with three men at work.—*Yreka Journal.*

BROKE GROUND.—Messrs. Leventhal & Co, have this week commenced the erection of a fine fire-proof stone building on the west side of the plaza, adjoining the Gem Saloon. We hope to see many substantial buildings erected during the season.

GRAND VOCAL AND INSTRUMENTAL CONCERT

THE BEST TALENT IN THE CITY ENGAGED.

To come off at Tucker's Academy of Music, on

Wednesday,.....May 15th, 1861.

On which occasion will be distributed SIXTY GIFTS, consisting of well known and immensely valuable Mining Claims in the Esmeralda District Estimated at \$7,475.

Tickets, One Dollar Each.

NATHANIEL GRAY,

UNDERTAKER,

155 Sacramento Street, corner of Webb, San Francisco.

Bodies prepared and shipped to all parts of the Atlantic States. ap11

WATER POWER FOR SALE OR LEASE!

FROM FIVE HORSE-POWER TO ANY AMOUNT WANTED, READY TO APPLY TO ANY kind of machinery, within five minutes' walk of the Sacramento Valley Railroad Depot, Folsom. Address COOVER & STOCKTON, mh15-1m Granite Flouring Mills, Folsom,

As the said applicant may elect in the term of his application. Provided that the fee to be paid in such application shall be for the term of three years and six months, ten dollars; for seven years, fifteen dollars; and for fourteen years, thirty dollars; and provided that the patentees of designs under this act shall be entitled to the extension of their respective patents for the term of seven years from the day on which said patents shall expire, upon the same terms and restrictions as are now provided for the extension of letters patent.

Sec. 12. And be it further enacted, that all applications for patents shall be completed and prepared for examination within two years after the filing of the petition, and in default thereof they shall be regarded as abandoned by the parties thereto, unless it be shown to the satisfaction of the Commissioner of Patents that such delay was unavoidable; and all applications now pending shall be treated as if filed after the passage of this act; and all applications for the extension of patents shall be filed at least ninety days before the expiration thereof, and notice of the day set for the hearing of the case shall be published, as now required by law, for at least sixty days.

Sec. 13. And be it further enacted, that in all cases where an article is made or vendible by any person under the protection of letters patent, it shall be the duty of such person to give sufficient notice to the public that said article is so patented, either by fixing thereon the word patented, together with the day and year the patent was granted, or when, from the character of the article patented, that may be impracticable, by enveloping one or more of said articles, and affixing a label on the package, or otherwise attaching thereto a label, on which the notice with the date is printed; on failure of which in any suit for the infringement of letters patent by the party failing so to mark the article the right in which is infringed upon, no damage shall be recovered by the plaintiff except on proof that the defendant was duly notified of the infringement, and continued after such notice to make or vend the article patented. And the sixth section of the act entitled "An act in addition to an act to promote the progress of the useful arts," and so forth, approved the 29th day of August, 1842, be and the same is hereby repealed.

Sec. 14. And be it further enacted, that the Commissioner of Patents be and he is hereby authorized to print, or in his discretion to cause to be printed, ten copies of the description and claims of all patents which may hereafter be granted, and ten copies of the drawings of the same, when drawings shall accompany the patents: provided the cost of printing the text of said descriptions and claims shall not exceed, exclusive of stationary, the sum of two cents per hundred words for each of said copies, and the cost of the drawing shall not exceed fifty cents a copy; one copy of the above number shall be printed on parchment, to be affixed to the letters patent; the work shall be under the direction and subject to the approval of the Commissioner of Patents, and the expense of the said copies shall be paid for out of the patent fund.

Sec. 15. And be it further enacted, that printed copies of the letters patent of the United States, with the seal of the Patent Office attached thereto, and certified and signed by the Commissioner of Patents, shall be legal evidence of the contents of said letters patent in all cases.

Sec. 16. And be it further enacted, that all patents hereafter granted shall remain in force for the term of seventeen years from the date of issue; and all extensions of such patents is hereby prohibited.

Sec. 16. And be it further enacted, that all acts and parts of acts heretofore passed which are inconsistent with the provisions of this act be and the same are hereby repealed.

Approved, March 21, 1861.

MINING IN SAN DIEGO.—Francisco Zapata Carbon, from whom the Zapata silver mine of the San Gabriel derives its name, is now engaged with a company in developing a rich silver lode in San Diego county, thirty-six miles below the town of San Diego, east, and about one hundred and eighty miles from this city. The country around is described as fertile and beautiful, plenty of wood, water and luxuriant grass abound. Good crops of wheat and barley can be raised. Placer gold diggings are said to exist in the vicinity.

SAN GABRIEL MINES.—We learn from a miner who came in town a few days ago, from the above locality, that there are about one hundred and fifty men at work in the cañon, as a general thing doing well. One company, Blake-well & Co., have been taking out an ounce a day for some time past. The company who are sinking a shaft to the bed rock, in the bed of the river, have not made much progress as yet. The miners complain bitterly of the want of mail facilities.—Ex.

NEW MINING COMPANY.—The Tajo Mining Company have filed articles of incorporation with the County Clerk, Capital \$192,000. with S. A. Hastings, James Nooney, C. L. Farrington, Millin Griffith and F. A. Benjamin, trustees. The scene of operations to be in the city of Rosario, on the river Rosario, in the State of Sinaloa.

TO INVENTORS AND DISCOVERERS, MECHANICS AND MACHINISTS:

The undersigned, having had great Experience and Facilities for completing and carrying out Inventions and Improvements upon all kinds of Machinery and Implements, also preparing the requisite Drawings, Models, and Specifications, and is otherwise conversant with all principles in Mechanics of modern practice, and could prove, therefore, of invaluable aid to Inventors and Discoverers. Those contemplating placing their inventions in a proper shape before the U. S. Patent Commission are particularly requested to consult the subscriber.

WILLIAM A. BURKE,
At A. Kohler's Piano and Music House,
ap11 Sansome street, between Clay and Commercial, up stairs.

ANOTHER PREMIUM AWARDED TO THOMAS DONNOLLY, AT THE ALAMEDA COUNTY FAIR, HOLD IN JUNE, 1860, FOR THE BEST MANUFACTURED CALIFORNIA YEAST POWDERS.

Read the report of the Committee, which is a sufficient guarantee for the superior quality of T. Donnelly's California Manufactured Yeast Powders, and which are now admitted to be superior to any now in use in California or elsewhere. The following is the report of the Committee:

"We would notice as worthy of patronage the very superior Yeast Powders on exhibition by T. Donnelly, having tested them, and found them much better than those imported."

Mrs. J. B. Weller, Mrs. C. M. Wentworth,
Mrs. S. E. Alden, Mrs. F. K. Shattuck,
Mrs. Dr. Newcomb.

The above decision is a satisfactory guarantee of the superior quality of T. Donnelly's Genuine California Premium Yeast Powders.

People of California! encourage home manufacture, and in the one article of Yeast Powders, you will benefit the State several thousand dollars a year that are taken away for an imported article that cannot compete with your own manufacture.

Try Donnelly's Yeast powders, and you will find them superior to any. one genuine unless labelled on the top of every can, and dated, 1860. Manufacture, 35 Front street, San Francisco. All orders will meet with prompt attention.

T. DONNOLLY & CO.

IMPROVED VULCANIZED GUTTA-PERCHA BELT.

We are now prepared to furnish to Machinists, Engineers, Millers and others, the above article of

Machine Belting,

which has been proved to be far superior to any other kind in use, being ENTIRELY FREE from the undesirable qualities of both Leather and Rubber. While possessing the good qualities of both,

IT DOES NOT STRETCH,

it is not affected by oil, HEAT OR STEAM; and in fact, is well nigh PERFECT, as all who have used it attest.

Besides all this, the fact that

It Costs Less

than either Leather or Rubber, which makes it supersede them altogether as soon as its merits are known.

We have also produced an article of

HYDRAULIC MINING HOSE,

which is offered to miners as SUPERIOR to any other article heretofore used for this purpose. It is made to

Stand Any Pressure Required.

WILL WEAR LONGER than any other article; will not Mildew or Rot; costs a moderate price, and is altogether

THE BEST AND MOST ECONOMICAL HOSE

ever used in California. It is made four and a half to eight inches in diameter, of different thickness, and stretch to stand pressure of from fifty to 200 feet perpendicular fall.

Catalogues and Price Lists sent on application to

CHARLES P. DANIELL & CO.,
Sole Agent for Pacific Coast,
41 California street, San Francisco.

ja24

A. KOHLER,

NO. 178 WASHINGTON STREET, SA FRANCISCO.

Forty Cases of Musical Instruments Just Received,

Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS.

Also, TAMBOURINES, BANJOS, FIFES, FLUTES, CLARION PICALOE, VIOLIN BOWS, BOW-HAIR, ROSIN BRIDGES, PEGS, TAIL PIECES, FINGER BOARDS, TUNING FORKS, SSS ROMAN STRINGS (four lengths and four thread), and

ALL KINDS OF MUSICAL INSTRUMENTS,

Fresh every two months from Italy.

All of these goods will be sold to the trade, as they are direct importations from the manufacturers of Europe, and imported in large quantities by A. Kohler. He will sell them THIRTY PER CENT. CHEAPER than any other house in California; therefore it would be the interest of all to call and examine before purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by the case.

The wholesale department of this House is on Sansome street, occupying the whole block from Clay to Commercial street. mh8

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our before extensive establishment, we can confidently announce to the public that we now have—
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp Mills and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Frames; Horse Powers; Smut Mills; Boiler Fronts; Wind Mills, of Huot's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to.

Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This Mill will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe.
Bartola Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco.

ASTROLOGER.

REMOVAL TO NO. 520 CALIFORNIA STREET, SIX DOORS ABOVE MONTGOMERY STREET.

Prof. COHEN begs to inform his friends and the public generally, that he has removed his office three doors above his former location.

Ladies and gentlemen, if you want to avoid trouble and misfortune, go and see the celebrated ASTROLOGER, Prof. COHEN. He has convinced many of his visitors that he is the only living Astrologer who is able to give correct information of the PAST, PRESENT and FUTURE, on Business, Health, Matrimony and sickness, any subject they may require; and he offers his services with entire confidence that he can give perfect satisfaction through his natural gifts and knowledge.

Prof. COHEN will draw an Astrological Diagnosis in cases of Illness, and will prescribe for and guarantee a perfect cure.

Consultation Hours—From 9 to 12 A. M. and from 2 to 11 P. M. every day. Consultations can be had in five different languages, including German. Consultation fee, two dollars, and by letter, five dollars. Address letter box 1697, or through Wells & Fargo's Express.

P. S.—When personal consultations are had, the age of the person is not required, but by letter it is necessary.

Four Reception Rooms are fitted up in elegant style for the comfort of visitors. Consultations can be engaged in advance for any hour agreed upon. ap19

HEYNE MANN, PICK & CO.

311 and 313 California street,

WAREHOUSE OF THE SAN FRANCISCO

POINER WOOLEN FACTORY.

Have Constantly on Hand

A FULL ASSORTMENT OF WHITE, BLUE, GREEN AND SCARLET, 2½, 3 and 4 point Blankets.

—ALSO—

Superior All-Wool Family Blankets.

—ALSO—

Sluice Blankets, especially adapted for Quartz Mining. This article has met with general approbation, and Quartz Mills in general will do well to give it a trial.

Having made great improvements in the works of the Factory, including new steam engines, etc., special attention will be paid to the execution of all orders.

Steamers and Hotels can be supplied with Blankets of the shortest notice. Buyers will please examine the California make, the superiority of which over imported Blankets is generally admitted.

All business connected with the Factory is transacted exclusively at their office—no other party being connected with it. ap19

GOVERNMENT HOUSE.

ONE OF THE BEST BUILT, MOST COMMODIOUS AND JUDICIOUSLY ARRANGED HOUSES in this city is the

GOVERNMENT HOUSE,

Located on the

Northwest corner of Sansome and Washington streets.

The building is new, has been recently repared, varnished and painted throughout; is furnished in the best style; is centrally and favorably located, being within easy access of the boats, places of public entertainment, and in the business heart of the city, and is admirably constructed with a view to the comfort and convenience of families.

For further particulars, apply at the office, ROOM NO. 5, first floor. ap19

HUNT'S

IMPROVED FIRST PREMIUM WIND MILLS!

AN ASSORTMENT KEPT CONSTANTLY ON HAND AT THE MANUFACTORY,

Nos. 30 Second street, 208 & 201 Jessie street, SAN FRANCISCO.

THIS WINDMILL WAS AWARDED THE FIRST PREMIUM AT THE MECHANICS' FAIR OF 1860, in San Francisco, for its great simplicity, strength and durability. It is easily controlled, and will be sold cheaper than any other Mill built. Further particulars in circulars.

The following committee awards the above premium: Devoe, Garratt & Ware; all of this city.

PRICES.—Eight feet wheel, \$50; Ten feet wheel, \$75; Twelve feet wheel \$100 to \$125. ap19 E. O. HUNT, Builder.

UNDERTAKING.—The undersigned would most respectfully inform their friends and the public that they have opened their

COFFIN WAREHOUSES

at 161 Sacramento street, below Kearny, and are ready at all times, night or day, to attend to every call in their line of business. Their stock is very complete, and will enable them to furnish every description of funeral, plain or costly, at the shortest notice.

All persons wishing to make interments in Lone Mountain Cemetery, can do so by applying to us at 161 Sacramento street. nov3

BENJAMIN D. DEAN, M. D.,

PHYSICIAN, SURGEON AND ACCOUCHEUR,

Has taken an Office No. 621 Clay street, in the Saving and Loan Society's building, between Montgomery and Kearny streets, where his friends and the public may consult him, professionally, during all hours of the day or night. dec28

STEINWAY & SONS' AND RAVEN & BACON'S

PATENT OVERSTRUNG PIANOS,

Just landed on ship GOLDEN EAGLE.

A Splendid Assortment of the above Celebrated Instruments have just been opened. Intending purchasers will please give us an early call. ap6 GRAY & HERWIG, Sole Agents, New No. 613 Clay street, San Francisco.

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work. The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be oiled, throws in or out of gear, without the driver leaving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up without removing bolt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- 12th. We invite Farmers wishing a machine to call and see before purchasing. KNAPP, BURRELL & CO., ap19 310 (Old No. 80) Washington street, near Front, San Francisco.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE Scientific American Patent Agency of Messrs. Munro & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$5. For arguing the case in the event of a rejection, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an appeal to the Circuit Court a reasonable extra charge will be made. For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LAT. COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as a gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States. ap25

NO 7.

Capital vs. Labor.

An important move has recently been made by the laborers of this city. On Saturday last they held a meeting at Sarsfield Hall, and resolved to work no longer at the ruling rates of wages, viz: \$2 and \$1 75 a day, nor for the ruling rates of time, viz: twelve hours. They consider their services worth \$2 50, and that they should not be obliged to work more than ten hours every day. Several hundred of the laborers have signed the constitution and by-laws of a society which they have organized under the name of the "Laborers' Protective Union," whose objects are as above. On Tuesday last the "Union" marched through the city, visiting all the places where they recently labored, inviting those whom they found at work to join them, but uttering never a threat if their peaceable request was not complied with.

There is no question in our mind as to the propriety of the step which the laborers have taken. They have been trodden upon by the contractors, until they turn to bite. It is said to be primarily owing to the fact that irresponsible persons hid for contracts, perform them, receive the money therefor, and then, pretending that they have lost much by the operation, fail to pay the hands. Thus these irresponsible parties contrive to make (or steal) money, and responsible contractors are forced to put in extremely low bids, and reduce the wages of the laborers correspondingly.

This plea may hold good in some cases, but not in general. It has always been our impression that the contractor, as any other business man of any stability, looks not to his profit on any individual job, but to those of the whole year. Our street contractors are shrewd men, and take good care seldom to lose anything, and generally make a great deal by their contracts. They average a handsome profit on each. If they happen then to lose on one, is that any reason why they should make wry mouths, and cry 'loss'? Wages of labor are too high now-a-days; they must be reduced?"

We sympathize with all our heart, with the laborers in this matter. The sum of two dollars and fifty cents a day is little enough in all conscience for the daily support of a family, but one dollar seventy-five! Why, it is starvation price! As for the ten hour system, we have always favored it; as we know from the experience of years that men will do quite as much in ten hours as in twelve. With only ten hours, there will be no "sknking" or "letting up!" The men will work heartily, and with a will. Contractors ought to know this, and if they are unwilling to learn, they should be made to.

IODINE AS A CURE FOR THE BITE OF THE RATTLESNAKE.

some of the Western papers, and with the authority of Judge W. F. M. Army, a naturalist who has been engaged for several years in gathering reptiles for the Smithsonian Institute, recommends iodine as a certain cure for the bite of the rattlesnake. Judge Army says, "I have usually used a dose of four or five drops of the tincture of iodine upon a lump of loaf sugar, to be taken inwardly by the person bitten—then cut slightly the skin, with a knife or lancet, at the place bitten, and saturate it thoroughly with the iodine. This treatment I have never known to fail."—*E.x.*

HUNT'S IMPROVED FIRST PREMIUM WINDMILL.

The accompanying illustration represents one of Hunt's Improved First Premium Windmills. It is so constructed that the pressure of the wind from behind (instead of in front of) the sails sets them in motion, and neither vane nor tail are required to keep it before the wind. By means of a very powerful brake, which can be worked by a woman or child, the mill can be stopped at any moment, without the slightest personal danger. The regularity and steadiness of its motion is superior to that of any other windmill known, and after thorough tests for four years, it has proved itself strong enough to withstand the most violent wind storms without the least damage. For cheapness, utility and durability this mill stands unrivalled. They are constructed of various sizes and power—from an eight-foot wheel, which costs \$50, upwards—by E. O. Hunt, at his factory, No. 28 Second street, in this city, where he has them constantly on hand.

A Valuable Book.

With pleasure we acknowledge the receipt from H. H. Baneroff & Co., of a work by John S. Hittell, Esq., entitled "Baneroff's Hand Book of Mining, for the Pacific States," the design of which is admirable, and as admirably carried out. It comprehends a condensed treatise on mining, and of the mineral resources of California—the mineralogy, chemistry and geology of gold; descriptions of the mining districts, prospecting, assaying, modes of placer mining, quartz mining, silver mining, with a digest of the laws of mining in California; and miscellaneous matter—the whole forming one of the most complete works of the kind, in handy shape for reference, that we have ever seen. It is gotten up in the style of Appleton's Hand Books, and reflects great credit upon author, publisher and printer. It will prove an invaluable companion to all.

POROSI.—The Pittsburg, the only tunnel in gravel, is doing even better than during the winter. A few days ago the Pittsburg boys cleaned up one hundred and eighty-three ounces, the result of ten days' run,—no more than half of the boxes being cleaned. This Pittsburg is not a dirty hole. —*Mountain Messenger.*

Valuable Hints as to the Construction, Location and Management of an Industrial State Prison.

On the 2d inst., Thomas Mooney, Esq., delivered an address, in the Assembly chamber, before the Legislature, upon a subject to which he has evidently devoted much time and thought. His suggestions, many of them, are very sensible, and we presume will have their influence during this, or a succeeding session, in removing the State Prison from its present profitless location to Folsom. We give a very brief synopsis of the gentleman's remarks:

The water power and granite of Folsom determine its suitability as a location for the State Prison. To build it, \$300,000 can be raised in State bonds of twenty years date, at 6 per cent. per annum. It must be built near a waterfall, and constructed in an octagonal shape, so as to give the most convenient play to machinery in eight compartments, each of which shall be a separate factory. One compartment shall be a woolen factory, the total cost of construction, machinery of the same, material and stock, being \$75,000; profit, \$200 a day, fifty men being engaged. Another shall be a paper mill, the buildings for which will cost \$12,000, machinery \$40,000, and working capital \$20,000; total, \$72,000. This will turn out 3000 pounds of paper a day and yield a daily profit of \$420. Another compartment shall be used for the manufacture of steel cutlery, in which fifty men can profitably be engaged; capital required, \$10,000. Another can be used as a tannery, the fitting up of which with sufficient working capital, would be \$20,000. Farming implements can also be manufactured with handsome profits; also household furniture. Hat making, requiring a capital of some \$10,000, is a branch of trade that could easily be carried on, and would prove remunerative. The making of hemp cordage should also be carried on, which would supply labor to hundreds of prisoners, and make California cordage famous throughout the world. Hardware, metal and tinware might also be manufactured with good returns. Extensive works for the reduction of quartz at very low prices, with improved machinery, might be erected, and mines of ores that at present do not pay, be made profitable. There are many marble quarries too, at Folsom. These could be cut into slabs and polished by the machinery driven by water power. Stone-dressing, quarrying can be engaged in; and as for the juvenile convicts, they can be employed in the manufacture of baskets, brushes, brooms, matting, etc.

We have some few works in this State for the manufacture of many of the articles above enumerated, but the great bulk unquestionably comes from the Atlantic States, and are the product of State Prison industry there. Thus the manufacture of these articles would not affect the Californian but the Eastern manufacturer. It would lessen our imports, and perhaps ultimately increase our exports. At present the convicts are as drones in the hive of the body politic. They live on the industrious people of California, swallowing twenty-five cents of every dollar of taxes collected by the State!

Said the lecturer: "I own not a foot of earth or water in Folsom or in Sacramento county, but I adopt that point as the theater of operations because railway and quarry, and water power there do concentrate; because there the prisoners may be visited at their works by the world as it passes by; because purchasers can drop in without expense on their way from the interior to the capital; because it is within an hour's ride of the Governor's office; because clerical men are ever passing through the place, and might without heavy expense, visit the fallen inmates, and contribute by their frequent exhortations to restore their moral sensibilities."

First American Ship in the Port of San Francisco.

THE first mention of an American ship in these waters occurs in the following letter from the Governor of California to the Captain of the Presidio of San Francisco:

SANTA BARBARA, May 13th. 1789.

"Whenever there may arrive at the port of San Francisco a ship named the *Columbia*, said to belong to General Washington, of the American States, commanded by John Kendrick, which sailed from Boston in September, 1787, bound on a voyage of discovery to the Russian establishments on the northern coast of this peninsula, you will cause the said vessel to be examined with caution and delicacy, using for this purpose a small boat, which you have in your possession, and taking the same measures with every other foreign suspicious vessel, giving me prompt notice of the same.

"May God preserve your life many years.

"To Josef Arguello.

PEDRO FAGES."

Twenty years before, this same Fages had sailed on the *San Carlos* to rediscover and people California. The *San Carlos* and the *Columbia*, and Fages the connecting link! The United States of America and California joined for the first time in a thought! It is impossible by any commentary to brighten the interest with which we read this document. Its very errors, even to the Governor's ignorance of the geography of his own country, are profoundly suggestive.

The *Columbia* did not enter the ports of California, but made land further to the north and discovered the Columbia river.

Fourteen years later, it would appear that American ships were more frequent on this coast.

On the 26th of August, 1803, José Arguello, Comandante of the Presidio of San Francisco, writes to Gov. José Joaquín de Arrillaga:

"That on the first of the present month, at the hour of evening prayers, two American vessels anchored in the port (San Francisco), one named the *Alexander*, under the command of Captain John Brown, and the other named the *Aser*, under the command of Thomas Raben; that as soon as they anchored, the captain came ashore to ask permission to get supplies of wood and water, when, observing that he was the same *Brown* that was there in the preceding month of March, he refused to give him permission to remain in port; that on the day following, at six in the morning, he received a letter from the captain (or supercargo), a copy of which he transmits, which is as follows:

"PORT OF SAN FRANCISCO,
August 12th, 1803."

To the Señor Comandante of the Port:

Notwithstanding your order for our immediate departure from this port, I am constrained to say that our necessities are such as to render it impossible for us to do so. I would esteem it a great favor if you would come aboard and see for yourself the needy circumstances in which we are placed. For during the whole of the time we have been on the north-west coast, we have had no opportunity of supplying ourselves with wood and water, the Indians being so savage that we have not been able to hold any kind of friendly intercourse with them whatever.

We have had several fights with them in the Straits of Chatham; the first was in the port of Istiquin, where we were attacked by 300 canoes, each canoe containing from ten to twenty-three Indians, each one with two or three escopetas, and their pistols and spears. Three times in one day they attempted to take the ship, but we defended the same without losing any of our men.

From this port we went to the Ensenada of Icaña, in said straits, at which place we found about 1000 Indians encamped, many of whom came aboard of our vessel for purposes of trade, carrying their arms in one hand and their skins in the other.

After we had been four days in this port, all the Indians came aboard, saying they were not afraid of the Americans, since they were but few, while there were many Indians, who had many arms.

On the fifth day of our stay in this port, about six o'clock in the evening, three or four canoes came alongside the ship, and on being ordered to leave they refused, when our captain seized a gun and fired it in the air, on which the Indians laughed very much, saying he did not know how to shoot, and could not kill; whereupon the captain seized another gun, fired at and killed the Indian, on which the rest retired to the land, and all of them went to a neighboring island; and from 10 o'clock at night till 8 in the morning they made no further demonstrations against us, at which time we made sail, in the meantime striking upon a rock and somewhat injuring our vessel.

From this port we went to Junco de Fuca, at which place we learned from the chief Tactu that the chief Quatlazape had taken the ship *Boston*; that when the said vessel had been some four days in port, the Indian chief and the captain of the ship having some difficulty in relation to trade, the captain of the ship said to the chief that he had traded with many chiefs to the north, and that he knew he did not act like an honorable chief; whereupon the chief, Pioque, replied to the captain that he was a bad man; at this the captain seized a gun and ordered him ashore; whereupon he went to his ranchera, and issued an order for the assembling of all the neighboring Indians, from the straits of Juan de Fuca to the point of Nulka, which were so assembled within three days; and after holding a council they determined to take the *Boston*, which they effected in the following manner:

At seven o'clock in the morning they went aboard, and asked permission of the captain to have a dance, as a ceremony of the renewal of friendship after their recent dispute. To which the captain replied that he was willing that they should do so. Accordingly, at eight o'clock in the morning a company of chiefs came and danced on the quarter deck, having, in the meantime ordered their people to arm themselves with knives, so that while they were dancing they could jump aboard and kill the whole crew, which they did; for while they were dancing they made presents of otter skins to the captain, and also to the sailors, who in a short time had collected on the quarter deck, when suddenly the Indians fell upon them, in their defenceless condition, and butchered all save two, who escaped and concealed themselves; the Indians carrying off everything that could be removed during the whole of that day and night, and until 12 o'clock the following day; having, in the meantime, discovered the two hidden sailors, who, after some cruel treatment, were handed over to the chief, who spared their lives, and they are now at that place. On the following day the ship was beached, and her decks and part of cargo burnt. Quatlazape has made a fortification at the place where the Spaniards were established.

This is all the account I am able to give of the matter, and I pray you, in the name of God, to come aboard our ship and see the needy circumstances in which we are placed, destitute of wood and water, and our vessel needing repairs. Trusting in your Christian charity, and that of your nation, we hope to be permitted to remain in this port the time necessary to obtain supplies and make repairs, since otherwise we will certainly lose our ship.

God preserve your life many years. JAMES ROWAN."

Ships' Compasses—Dangerous Attraction—Engines and Iron Hulls.

SINCE iron has commenced to enter so largely in the construction of ships, the errors of the compass have become very frequent and dangerous. Any useful information on this subject has, therefore, a specific claim upon maritime nations, and upon none more than ourselves. A very interesting paper on this topic was lately read before the Convention of Naval Architects, in London, by F. I. C. Evans, R. N., superintendent of the compass department in the Admiralty. He stated that in sailing vessels the north pole of the needle was almost invariably drawn toward the ship's head, but the action, in all cases, was very limited in power. In steamships with wooden hulls the machinery oftentimes disturbs the needle, and the magnetic force varies in direction, according to the arrangement of the engines and boilers; therefore, great care should always be observed in fitting up machinery, so as to arrange it in such a manner that the least possible attraction will be exerted to disturb the true action of the needle.

In most all iron vessels, the errors produced in the compass by local attraction are very uncertain and dangerous, and more so than is commonly suspected by the builder, owner, or navigator. In constructing an iron steamer, the hull very frequently becomes a large magnet, divided into two portions, similar to a magnetic bar, having a north and south pole. This is caused by the repeated hammering necessary in riveting the plates. When this is the case, the poles of the iron hull attract and repel the poles of the delicately-poised compass needle, and render it unreliable. It has been found that different kinds of iron used in shipbuilding possess different magnetic qualities. The softer the iron, the more subject is it to great magnetic changes, and therefore the more likely to lead to errors in the compass, and to increased dangers in navigation.

It has also been noticed that iron ships are in more danger from local attraction immediately after being launched than after they have made one or two voyages. Owners of iron steamers should, therefore, be very careful not to send them to sea very soon after they are launched, but first trim them carefully, and be sure to have the compasses perfectly adjusted before a voyage is undertaken. An iron ship should be thoroughly tested with the compass when the hull is completed, and when being equipped and its engines put in, its head should always be turned in a contrary direction from that which it occupied when the hull was in process of construction. As iron steamers which have their engines put in before they are launched cannot comply with these arrangements, it would be better not to fit up machinery in any case before launching. After the engines are fitted up in working order in a steamer, they should be kept constantly moving for several days at the dock, before a trip is undertaken even when all the parts are in working trim. This suggestion is made in order that the magnetism acquired by the hull through the riveting operations, may be "shaken out." The long vibration of the engines will tend to destroy the induced magnetism in the mass of iron which results from the hammering of the plates, as the magnetism induced by the latter is due to long continued and short vibrations.—*Ex.*

We learn by the last pony that Lieut. Mowry received from Washington instructions to discharge the employees of the Boundary Commission, sell the property of the Commission to the best advantage, and report any indebtedness which the sale would not discharge, for payment immediately, and to wait further orders. These instructions will, of course, close all operations in reference to our boundary for the present. We also learn that Lieut. Mowry forwarded to President Lincoln the resignation of his Commissionership some two weeks since, to take effect immediately.

New Mills.

THE Crown Point Company, whose claim is located a little south of the Gold Hill claims, on the same line, after having sufficiently tested their rock, have incorporated as a company, with a capital of \$120,000. The following gentlemen have been chosen officers: President, Capt. Creary; Secretary, Mr. Jones; Superintendent, Mr. Staples. They have commenced the construction of a substantial mill, which they expect to have completed in thirty days. The mill will be forty-two by forty feet, with ample room, if required, for its extension. The engine will be twenty-horse power. Bryant's batteries and Knox's amalgamators are to be used. The foundation for this mill is of the most substantial character, and the supply of water sufficient during the entire year. The investment cannot but prove a profitable one, as the rock obtained from the lead is of established value, and the amount almost inexhaustible. About two hundred yards from this mill, Mr. Hobart is constructing a large one, to be propelled by a forty-horse power engine. The batteries, twenty-four in number, are to be of the Bryant patent and Knox's amalgamators will be used. The enterprising proprietor expects to have it in running order in about thirty days.—*Ter. Enter.*

Rich Diggings.

WE understand from a gentleman from Forest Hill, that the Independent Company have struck what is supposed to be the "Buck Lead," in the Forest Hill Ridge. Our informant states that the gold lies in blue gravel, and he describes it as being "lousy" with gold. The Independent Company have been prospecting for this lead for about two and a half years, at an expense of about \$70,000. They ran a "slope" tunnel at an angle of about forty five degrees to the depth of about 450 feet, when they struck the rock pitching towards Devil's Cañon. They then turned and ran a slope, following the rock down to a great depth until the deposit was reached. The gold found in the slope is not upon the rock, but is imbedded in a strata of blue cement gravel. This discovery will add much to the permanence and prosperity of Forest Hill. In fact, it will cause hundreds of thousands of dollars to be immediately invested in tunnels upon the Devil's Cañon side of the ridge.—*Territorial Enterprise.*

Salt.

SOME parties from Carson and Virginia cities have discovered a large salt lake or marsh near the sink of Walker river. The section of country in which it was found abounds in saline springs. The lucky proprietors of the lake say that an unlimited supply of the article can be procured. They obtained 1100 pounds in a few hours. The managers of the Central and Spanish mills, after testing the salt, pronounce it a very superior article. The discovery of salt so near home is an item of great importance; for, in addition to the amount required for culinary purposes, vast quantities are used by our mills in reducing ore—the proportion being about one ton of salt to twenty tons of ore. Salt is now worth from ten to twelve dollars a hundred pounds in this market, so that some idea of the value of salt mines may be formed. As our mines are more thoroughly developed, the value and consumption of salt will materially increase.—*Territorial Enterprise.*

Gold Hill.

ANOTHER proof that Gold Hill is getting richer the lower the leads are followed down, may be seen by the following results: Harold & Dryman had crushed at the mill of Mosheimer & Co., on Carson river, 300 tons just as it came out from the mine; the first hundred tons paid about \$30 a ton, the second hundred tons \$60, and the third hundred tons, \$90. If the yield keeps at this rate, the lucky proprietors will soon realize a fortune worth having. In the claim of Messrs. Mosheimer & Winters, they have struck in their main lead (which is now twenty feet wide) another smaller vein, from which they took out twelve bags of ore in one day, paying on an average, \$1 60 a pound, or \$1200 to the ton. This ore is taken out 100 feet above their tunnel, which is already 200 feet long. In about ten days they expect to strike the main lead.—*Territorial Enterprise.*

THE AMERICAN COMPANY.—This company continue to get pay at the rate of an ounce a day to the hand. Their ditch is now completed, and they are ready to furnish water to companies at reasonable rates. Recent developments lead to the belief that the paying range is extensive. On the opposite side of the hill, prospectors are getting seventy-five cents to the pan, with encouraging prospects for rich hill diggings. An assay shows the gold obtained thus far to be worth \$17 50 an ounce.—*Washoe Exchange.*

MIGRATORY.—The *Mariposa Gazette* says that one-third of the people of that county will cross the mountains this summer, destined for the silver regions. It also says that mules are so cheap that silver-hunters can supply themselves without atealing, as many have done.

GOOD PAY.—The San Andreas Independent has been informed that Huford & Sherer, who own a quartz ledge at Carsons, which they have recently tested, obtained from one hundred tons of average rock, crushed in the Crystal mill at Angels, \$4,000, or \$40 a ton.

SCORPION COMPANY.—This company, after running their tunnel a distance of 270 feet, have reached the casing of their ledge, and will strike it in a few days.

New Mining Invention.

SAN JUAN, says the *Hydraulic Press*, boasts another inventor. Mr. Joseph Thomas has just completed the model of a drum for saving gold in quartz mining, which, it strikes us, must come into general use.

The invention is a sheet iron drum, ten feet in length, and three in diameter, in exact resemblance to a steam boiler. An iron axle traverses the interior of the boiler, longitudinally, which is held to its place by six series of spokes, with fellows, like those of a wagon wheel, which fellows are joined and form complete circles around the inside of the drum, and serve as rifles, against which the quicksilver is deposited. The drum is placed at an angle of half an inch to the foot, and has a rotary motion in a box, similar in appearance to a wayside water trough, at one end of which there is a gate for the escape of sand, gravel and water. The pulverized quartz is precipitated with a steady stream of water into this revolving drum, where the current becomes almost imperceptible, and is yet so complete as to permit an escape of all the tailings without the loss of any gold, for what little may escape from the drum is sure to be caught in the trough, where there is also a deposit of quicksilver. Mr. Thomas has made an application for a patent.

For the Scientific.

THE Milwaukee correspondent of the Railroad Review states that there is an engine in use on the Milwaukee and Prairie du Chien Railway, which when fired up, shows the presence of electricity, in a manner and to an extent which, to machinists in this section, is unaccountable. If any of your readers can furnish an explanation of the cause, we should be pleased to have them do so. When she is blowing off, or steams escaping from the safety-valve, the lever and everything connected therewith are heavily charged with electricity, even the roof of the cab. By touching either, the engineer receives a severe electric shock. At night it seems more highly charged than during the day, and the light or current of electricity can be seen passing along the upper works of the engine. Sometimes when she is standing still, and escaping steam, the report is similar to the explosion of fire crackers or percussion caps. She throws off small globules resembling oxid of iron, in considerable quantities. What is singular, there are twenty five engines of the same make and sixteen as near alike to this as can be made, in use upon this road, and none of the others have any appearance of being electrified.

QUICKSILVER IN EL DORADO.—Mark H. Myers, of Forrest Hill, writes to the *Placer Courier* as follows:

About one year since I, in company with some other miners, in prospecting about one mile east of Centerville, in El Dorado county, discovered specimens of cinabar, which clearly indicated the presence of quicksilver. We at once staked off our claims, and last year expended some four hundred dollars in sinking shafts on the lead which we traced some two thousand feet. Some of the ore we had assayed, which yielded eighty per cent. We design commencing operations again on the 1st of May, and shall fully test the value of the lead.

INTERIOR MINES.—The Jacksonville *Sentinel* of the 13th, says: "We have special reports from Williamsburg, Applegate, Table Rock and Gasburg diggings. At each district the miners are steadily employed, with water plenty, and the average wages obtained. Mr. A. Savage, of Table Rock mines, has shown us a thirty-five dollar piece of gold and quartz taken from his claim last week.—General reports from all other mining localities are favorable. One company at the Pleasant creek diggings had realized ten dollars a day to the hand from a new cut recently made, although right adjoining. A little while ago, the earth scarcely paid for washing.

CENTRAL MILL.—The Central mill is doing finely. The Veatch process is a success, and extracts within ten per cent of the value of the ore. The mill crushes about three tons of rock a day, the average of the rock yielding two hundred and fifty dollars to the ton. The value of the metal when in bars is from one dollar thirty to one dollar forty per ounce. In the lead of the company is found a vein of the black sulphurets of silver, about two feet in width, which is supposed to extend the entire length of the vein, as it has been struck in five different places. The rock from this strata assays from fifty dollars to six hundred dollars a ton. This company are doing a moderate safe business, and are making money.—*Ex.*

CALIFORNIA COMPANY.—This Company are now taking some superb rock from their claim. They have had to run but one hundred and fifty feet to strike their ledge, and the facilities for working it are very convenient. The lead is about sixty feet in width, but the richest rock is obtained from a strata about twelve inches wide. The company intend to ship their rich ore to San Francisco for the present, but will erect a mill the coming season.—*Ex.*

PROSPECTORS.—Quite a number of prospectors in Long Valley, are waiting for news from the Indians around Pyramid Lake (as it was reported they were hostile) before proceeding there to prospect.

Galena District.

As a mining locality, this district does not sustain the reputation abroad to which it is justly entitled; one reason for which, is found in the fact that in all the ores found in this district lead largely predominates. The impression exists in the minds of a majority of the world, that silver is found only in very small quantities, so small that it will not pay the expenses of reduction. From the best information we can obtain on the subject, this mineral can be smelted at for less cost than such as has not lead for a base. Assays show silver from sixty to six hundred dollars a ton, and experience proves that the deeper the mine is worked the larger the proportion of silver; or, in miners' phrase, "lead runs into silver."

The facilities for wood and water, are unequalled, titles undisputed, and the amount of mineral inexhaustible. With these advantages we can see no reason why investments in the Galena District should not be made with a reasonable probability of satisfactory returns. The prospects will certainly justify the erection of a smelting furnace, and a fair test of the productiveness of the ores.

Two companies, the Independent and Quincy, have organized joint stock associations, and seem disposed to test the value of their claims. As yet their progress is so slow that we are forced to believe them deficient in enterprise. Would it not be advisable for these two companies to offer some inducement to parties willing to erect furnaces. Our experience is that it is better to own half of a paying claim than the whole of a non-paying one.

Quartz Mining about Volcano.

QUARTZ mining about Volcano has received a new impetus, and is now engaged in by more persons than ever before. At the Siebenthaler lode a new shaft has been opened, and better quartz found than in either of the old ones. Geo. L. Gale, at Contreras, as we are informed, is getting out some rich rock. Tulloch and Stacy are down on their new shaft, about forty-five feet. At that depth the vein is forty feet wide, and pays the whole width. This is, perhaps, the best quartz lode in the county, if not in the State. It has averaged since last summer about thirty-five dollars to the ton. The rock is divided as it comes from the shaft, Mr. Stacy having his part crushed at Judge Fiske's toll mill, on Grass Valley creek, and Tulloch crushing his own. He has two mills—a steam stamp mill on Else's creek, and a water arastra on Sutter creek. The arastra mill is a model one. It only cost some twenty-five hundred dollars, runs two sets of arastras and two stamps, to partially pulverize the quartz before placing it in the arastras—and crushes sixty tons a month, at an expense of no more than about one dollar and a quarter a ton. This mill is well worthy the attention of those who think of engaging in quartz mining. In the immediate neighborhood of this lode are a number of others, some of them known to be good; among these are the Italian Company, James & Co.; Capt. Douglas, and Frank McBride have leads there, and say that they are getting encouraging prospects. The lodes in this vicinity are very large, and nearly all have more or less gold in them.—*Amador Dispatch.*

Clear Creek Ditch.

It is now a fixed fact that this company have made arrangements to immediately extend the present line of their ditch, and run it a short distance beyond Dinsmore's Four Mile House, where a reservoir covering one hundred and sixty acres of land will be built. From thence it will be carried in ditches upon the rich mineral lands of Maj. P. B. Reading, Salt Creek, Lower Springs and Middle Creek. It is expected that the work will be completed in about three months. This enterprise will then give employment to at least one thousand men the year round, in the richest mineral lands in the State.

Large fortunes have already been made in these mines, wherever parties have been enabled to bring natural water upon them. And now that ditch water can be supplied to these diggings, we will be much surprised if tons of gold are not taken out during the coming fall.

This enterprise on the part of the Clear Creek Company when completed should be highly appreciated by our miners, merchants and citizens generally, as a new era in the business prospects of our country.

God speed the enterprise—for he knows we need it—and many more such during the summer.—*Shasta Courier.*

Quartz Machinery for Sonora.

WE saw lately, at the Union Foundry of Mr. Peter Donahue, portions of a new steam quartz mill, which is being made for the Alzurus Company, proprietors of the Los Bronces mines in Sonora. The order for the mill was brought to this city by Mr. Duffin, an experienced engineer, who is to superintend it after it goes into operation. The machinery is being made in the excellent manner for which Mr. Donahue's foundry is famous throughout the State, and it will be finished in a superior style. The engine will be of thirty-horse power. The boiler will be in pieces of two joints each, and the fly-wheel in three pieces, for convenience of transportation over the mountains by Indians. The mill will run four barrels and fifteen stamps. When finished it will be the finest piece of machinery of the kind ever turned out in this city; and it will doubtless excite much curiosity among the Sonoranians, who have never seen any mining machinery more complicated than an arastra.

To Explorers, Discoverers, Prospectors, and Miners, on the Pacific Coast.

The forms in which silver occurs in nature are:

Native Silver.

Geognostic Situation.—Primitive and secondary rocks with the ores of silver, copper, cobalt, etc. It often occurs penetrating crystals, or amorphous pieces of common quartz.

External Characters.—Color, silver white, often tarnished gray, or reddish. Occurs dentiform, capillary, ramose, reticulated, seldom massive, more frequently disseminated; also in plates and spangles, and crystallized in tubes, octohedrons, rhomboidal dodecahedrons and tetrahedrons. Luster, splendid to glimmering. Fracture, fine hackly. Specific gravity = 10 to 10.5.

Chemical Characters.—Fusible into a globule. Melts at 1873° or a red heat. Soluble in aquafortis, forming the well known lunar caustic.

Distinctive Characters.—Its color and malleability.

Composition.—Silver, with a little iron, antimony, copper or arsenic.

Antimonial Silver.

Geognostic Situation.—In primary rocks, as granite and clay-alute, associated with the other ores of silver.

External Characters.—Color, silver or tin white. Occurs massive, in grains and in cylinders, also in curved laminae. Yields to the knife. Fracture, conchoidal. Specific gravity = 9 to 10.

Chemical Characters.—Fusible, with the emission of antimonial vapor, into a globule of silver.

Distinctive Characters.—Want of ductility; and the antimonial vapor; not giving a blue globule with borax.

Composition.—Silver 84; antimony 14.

Sulphuret of Silver.

Geognostic Situation.—Primary and secondary rocks, associated with the other ores of silver. It is an important ore for the extraction of the noble metal.

External Characters.—Color, dark, lead-gray, often with an iridescent tarnish. Occurs in tubes and octohedrons; also reticulated, ramose, lamelliform, amorphous, and in plates. Cleavage, imperfect. Fracture, flat, conchoidal. Malleable. Easily scitile. Specific gravity = 7.

Chemical Characters.—Fusible with intumescence and odor of sulphur, leaving a globule of silver.

Distinctive Characters.—It may be distinguished from native silver by its less specific gravity, and its sulphurous odor under the blowpipe.

Composition.—Silver 85; sulphur 15.

Brittle Sulphuret of Silver.

Geognostic Situation.—Primary rocks, with the other ores of silver. It is a very rich ore.

External Characters.—Color, dark, lead-gray, or bluish gray, passing into iron black. Occurs massive and disseminated; also in hexahedral prisms. Luster, metallic or dull. Structure, foliated; crystals mostly intercept each other. Soft and brittle. Fracture, conchoidal. Specific gravity = 7.

Chemical Characters.—Fusible, with the evaporation of sulphur, arsenic and antimony, into a globule of silver surrounded by a slag. Soluble in aquafortis.

Distinctive Characters.—It differs from sulphuret of silver in its want of malleability, and from other ores by its dark color and brittleness.

Composition.—Silver 66.5; antimony 10; iron 5; sulphur 12; arsenic and sulphur 5.

Sulphuretted Antimonial Silver. (Red Silver).

Geognostic Situation.—Primary rocks, chiefly in granite, mica slate and porphyry. It is a valuable ore.

External Characters.—Color, red of various shades, passing into lead gray and grayish black; powder, crimson red. Occurs in masses and grains, also dentritic, membranous, capillary and crystallized in hexahedral prisms, terminated by hexahedral prisms; also, in double six sided pyramids. Luster, metallic adamantine; crystals often striated. Structure, imperfectly foliated. Yields to the knife. Translucent, opaque. Specific gravity = 5.20 to 6.68.

Chemical Characters.—Fusible, with antimonial fumes.

Distinctive Characters.—It differs from sulphuret of arsenic in having a greater specific gravity, and in leaving a globule of silver. Sulphuret of mercury is entirely dissipated by the blow pipe. The sulphuret of silver is malleable. Specular oxyd of iron is magnetic after being submitted to the blowpipe, and the red oxyd of copper is readily reduced to the metallic state by the blowpipe.

Composition.—Silver 60; antimony, 20.3; sulphur, 14.7; oxygen, 5.

[To be continued.]

SILVER AND GOLD IN EL DORADO.—The excitement consequent upon the discovery of a rich gold and silver lode near Cox's Station, about twenty-eight miles from Placerville, still exists, and more extended and rich discoveries than those mentioned in the last Californian have since been made.—*Marysville Express.*

NEW DIRECTORY.—The Sacramento Directory for 1861, compiled by H. J. Bidleman, issued from the press this morning, and will be rapidly supplied to subscribers. The Directory consists of about two hundred pages, and contains upwards of five thousand names.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY MAY 11, 1861

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Effects of the War upon our Industrial Pursuits.

Now that civil war, with all its long train of horrors, has burst upon the United States, it is well to glance at the effects that will be produced upon the industrial pursuits of California. People differ materially as to the length of time that must transpire ere peace again smiles upon our Union. Some imagine that the war will be protracted for many years; others that six months or one year will see the supremacy of the Government re-established on a firmer basis than ever. We are of the latter belief, but as we are "neither a prophet nor the son of a prophet," we claim no superiority of prediction over others. The effect of the war in the Eastern States will be to strike terror to the hearts of thousands of wealthy and timid people, who will naturally seek refuge in some more peaceful land. Europe threatens to be convulsed with war, so that would afford an insecure refuge. The climates of Asia and Africa and South America are uncongenial; Mexico is insecure; Canada may yet, in some way, become involved in the terrible struggle just commenced between North and South. California and Oregon are the only States upon the continent of America, where, during the fierce conflict, these families and their wealth can remove and live among their own countrymen, enjoying a perfect security of life, property, religious and political tolerance, and universal liberty of conscience, under the free institutions of our Government, preserved in all their original purity. Here martial law will not raise his forbidding front. We are, fortunately, so far removed from the seat of war, that it will scarcely be felt, except in the advanced prosperity of the State, and in our hearts, whose anxious beatings will keep time to the harsh throb of the war-drum, leading our brothers to the deadly conflict. To the quiet shores of the broad Pacific, then, these families will fly; and as California offers far greater inducements to the immigrant than Oregon, nine-tenths of them will settle here.

With this largely increased population and wealth, will be brought the necessities and the means for increased productions in every individual pursuit. Old factories will be enlarged, new ones erected; every branch of mechanical labor will thrive; the arts and sciences will flourish; wider fields will be thrown open for the agriculturist, and all available land will be successfully cultivated; our mineral resources—not gold and silver alone, but of the baser metals—will be more thoroughly explored and developed; and instead of being an importing State, California will be known to the world as a great manufacturer and producer. Her foreign commerce will receive an incredible impetus, because the commerce of the actively warring States of the Union will be severely checked, and all pursuits, save that of blood-red war, seriously retarded. When factories are stopped in one place, they must spring up in another, for the great world is progressive, and the wants of the world increase instead of diminishing. Thus, when we hear of the factories in the Eastern States stopping, we naturally look to see them arise in California, and they will.

If the present war prove of short duration, California, however much she may regret the unnatural strife, will be a pecuniary gainer; but, if it be protracted, she will achieve the most glorious destiny ever prophesied by her most enthusiastic admirers, in an inconceivably short time. Thus, out of this terrible national trouble, this black shadow which now darkens our beloved land, can we draw this drop of consolation. Yet we would not that, like the ignoble carrion-crow, California should grow fat upon the blood and mangled flesh of the dead and dying. Rather let our prospects as a State languish (if they must) than that this unholy war continue. Much as we love California, we love the Union more.

CRAIG'S FLAT.—Some parties bought, a week or two since, the American Co's diggings at Craigs, for \$7000 in cash. A saddle train is now running from Eureka to the Flat.

The California Miner of Yesterday and To-day.

Of all legitimate business excitements in the world, there is none so intense as gold mining; of all pursuits known to mankind there is none so fascinating. The love of gold, which is the "all in all" to human beings, is the prime motor in nearly all our actions; and the search for it has been ardent and constant ever since its first discovery—whether in the mine or the studio of the alchemist. In California, you will, even at this comparatively late day, find few of our lawyers, physicians, editors, bankers, merchants and shopmen, who have not had their experiences in mining. Adventurous spirits they but "easy come, easy go," has been the rule which has ruined most of the earliest wielders of the pick and shovel, and few indeed among the "old '49-ers" are possessed of an independence. And yet, though bereft of fortune, through improvidence or rash business speculations, these glorious old pioneers of California still derive a species of pleasure from the reminiscences of the golden past. Often in dreams, by day or night, they are transported back to the halcyon days when "rich strikes" were frequent and "six-ounce diggings" common.

In the early days, when sometimes flour was two dollars a pound, and potatoes to be had for neither love nor money; when a small-sized onion would fetch a dollar, and pork and beans, at high prices, was the standing dish; when gum boots were unknown and sluicing uninvented; when the seeds of rheumatism were being sown, and scurvy paid periodical visits to the mining camps; when a "Live Woman in the Mines" was a phenomenon, and preachers bowed to the shrine of Mammon; in those good old days, the California miner was very different from the California miner of today. Then, if the traveler stopped to speak to a group of delvers, whether in placer, cañon or river diggings, he would be pretty sure to find among them men of classical education, large experience, varied information and high accomplishments; men from Oxford and Cambridge, Göttingen and Freiberg, Yale and William and Mary's; men of rare scientific knowledge, proficient in the various professions, and who would crack a joke in Latin or Greek, as readily as they could handle a boulder. And the strangest part of all, was that these well-bred gentlemen and ripe scholars, with big brains, delicate features, small white hands and slight frames, could work like Trojans and put born laborers to the blush! This much for the Spirit of Man—the Spirit of the Will—which, loaded by ambition, worked many a poor devil of them to death. The traveler will often see in his journeyings amongst the Sierras, patches of luxuriant vegetation, sprung from the mould enriched by the flesh and bones, and brains, of such men. Poor fellows! all their learning and ambition, and energy, availed them not. Mothers and wives, and daughters, yet mourn them as lost treasures. May these departed lights shine brighter in the better world—that world whose existence few question and all hope for.

These scholar and gentlemen miners of the good old days have nearly all disappeared from the mines. Death, as we have observed, has done his work with many; others have gone to their homes, either with a sufficiency of wealth to make them comfortable for life, or disgusted with laboring on and on with lessening prospects; and the others have nearly all rejoined their proper social spheres, and are now to be found in the cities and towns of our State, practising their professions or engaged in some more lucrative and congenial business than mining, which at best is the rashest class of speculation.

The mines of California still throng with men of good education, strong sense, and the noblest impulses of human kind, whose patriotism, too, in these dark days of treason and rebellion, is strong as it was in the hearts of the fathers of the Republic. Few indeed are the California gold miners who are not true as steel to our common country; and if needs be, twenty thousand of the bravest and hardest spirits in the whole world would drop shovel and pick, and rifle in hand, would fly to the support of our glorious Union!

COLD CAÑON.—Didn't reach this camp, but were informed that business was at a stand still, and claims failing to pay much. A gentleman from the Cañon, however, informed us that a good prospect had recently been obtained in the tunnel of Fashion No. 2.—*Mountain Messenger.*

Deutscher Naturwissenschaftlicher Verein.

(GERMAN SCIENTIFIC CLUB).

WEDNESDAY EVENING, May 8th.

Society's Hall, Clay street, over the Merchants' Exchange.

Dr. Eckel presiding, called the members to order. Present—Messrs. Neuhaus, Sec., Schmidt, Drs. Lane and Regensburger, Behrens, J. Silversmith (Ed. Press), Erbe, Hiller, Bornemann and Michels. The minutes as read were adopted.

Dr. Eckel stated that he had received letters from the vice governor of Silka, Rns. Pos., saying that he instructed a scientific friend, Mr. Bauer, to interest himself in behalf of this praiseworthy institution.

A resolution, transposing the day of meeting to Thursday instead of Wednesday, was ordered published, and will be argued at the next meeting. Mr. C. I. Milde, of Luebeck, renowned as an Entomological Delineator, and curator to the museum of Luebeck, was offered by Mr. Behrens as a corresponding member. The motion for the election of a special room committee was lost. Some discussion was had over this matter, the committee reported it expedient to remove at once. The association finally instructed the committee to act at will. A beautiful bureau was donated by Mr. Riehn to the society, for which he received their thanks.

Mr. Erbe deferred his mineralogical discourse, owing to the limited number of members present. He gave, however, a very interesting description of the several leading elements, oxygen, hydrogen, carbon, sulphur, etc. We are promised by Mr. Erbe a written report for publication in the Press, which, for its scientific research, data, facts, theories and figures, will prove highly interesting and instructive.

California Academy of Sciences.

MONDAY, May 6th.

Society's Hall, Court Block, Clay street.

The members being called to order, Col. Ransom took the chair. Present—Drs. Trask, Kellogg, Eckel, Behr, Messrs. Nevins, Dunn, Stivers, Hanks and Silversmith (Ed. Press).

Minutes of last meeting were read and adopted, with an amendment by Dr. Kellogg to strike out that portion pertaining to the description given by him of the *Monolopia Globata*. Mr. Stivers presented a specimen of rock brought from Washoe. Dr. Kellogg described a variation of the "Astragalus Hypoglossis Strigosa." The same reported that he had obtained through Mr. Dunn a new *Alum*, now cultivating at Alameda, of which he will give a synopsis shortly. But little business or new matter being transacted the society adjourned.

MINERALS IN OUR BODIES.—In the body of a man weighing one hundred and fifty-four pounds, there are about seven and half pounds of mineral matter, consisting of phosphate of lime, five pounds thirteen ounces; carbonate of lime, one pound; salt, three ounces, three hundred and seventy-six grains; peroxyd of iron, one hundred and fifty grains; silica, three grains. Making seven pounds, five ounces and forty-nine grains, with minute quantities of potash, chlorine and several other substances. The rest of the system is composed of oxygen, hydrogen, nitrogen, and carbon; one hundred and eleven pounds of the oxygen and hydrogen being combined in the form of water. Though the quantity of some of these substances is very small it is found absolutely essential to health that this small quantity should be supplied; hence the importance of a variety of food. If we furnish nature with all the material required, she will select such as the system need, and always just in the proper quantities.—*Ec.*

TELEGRAPH COMPANY.—Articles of incorporation were filed on the 13th instant, in the County Clerk's office, at San Francisco, by the Overland Telegraph Company. The routes proposed are from San Francisco to Salt Lake City, and to El Paso. The capital stock is \$1,250,000, in shares of \$100 each. The following amounts have already been subscribed for: H. W. Carpenter, \$1,200; J. Mora, Moss, \$600; J. M. McDonald, \$600; D. S. Roberts, \$100; R. E. Brewster, \$100; James Gamble, \$260; I. M. Hubbard \$600, and James Street, \$4,160.

STILL THEY FIND IT.—We were shown some ore taken from the Grattan ledge, Silver City, which is proving very rich. There is a shaft one hundred feet deep, sunk on the ledge, which is from four to six feet wide. The owners in the Grattan are very confident that they will realize their fortune. They are still going down and are certain they will find the real stuff—soon.—*Terr. Enterprise.*

HAWLEY & CO.

IMPROVED AGRICULTURAL IMPLEMENTS.

The adjoining engraving represents the large salesrooms of Messrs. Hawley & Co., at the corner of California and Battery streets, in this city, where perhaps the largest and best assortments of farming implements that can be found on the Pacific Coast, are kept constantly on hand. We visited them recently, and found among great modern improvements in agricultural labor, the celebrated "Buckeye Mowing Machine," which has proved itself to be the best mowing machine in the world; the Kentucky Harvester, a combined reaper and mower; "Ketchum's Reaper and Mower;" "Easterly's Self-acting Reaper and Mower;" and "Russell's Patent Threshing Machine"—all bearing high repute in the minds of American farmers, and in extensive use throughout the United States. We found these and other patented improvements in farming implements, well worthy of examination, and it would be wanting in duty to our agricultural readers, did we not recommend them to pay the salesrooms of Messrs. Hawley & Co., in San Francisco, or at the corner of E and First streets, Marysville, a visit before going elsewhere.

It may not be amiss to state that Mr. Hawley has been engaged in his present business since 1849, and that estimable gentleman has always given the greatest satisfaction of those who have had the discrimination and good fortune to transact business with him.

PATENT LAW AMENDMENT.

OF 1861.

HOW TO OBTAIN PATENTS

UNDER THE

NEW LAW.

The Patent Law Amendment Act, passed March 4th, 1861, and now in force, introduces several important changes in our Patent System. The general practice of the Patent Office, however, in regard to the examination and issue of Letters Patent for new inventions, remains nearly the same as heretofore.

The first question, therefore, that presents itself to an inventor who desires to procure a patent, is: "Can I obtain a patent?" A positive answer to this question is only to be had by presenting a formal application for patent to the Government, embracing a petition, specification, model, duplicate drawings and the payment of the prescribed official fees. Aside from these, the inventor can do no more, to submit his plans to persons experienced in the business of obtaining patents, and solicit their opinions and advice. If the parties consulted are honorable men, the inventor may safely confide in their plans to them, and they will inform him whether or not his invention is probably patentable.

Those who have made inventions and desire to consult with us respecting the same, are cordially invited to do so. We shall be happy to see them in person at our office, or to advise them by mail, or through the Mining and Scientific Press. In all cases they may expect from us an honest opinion. For these consultations, opinion, and advice, we make no charge. A pen and ink sketch and description of the invention should be sent, together with a stamp for return postage. Write plain; do not use pencil or pale ink; be brief.

Remember that all business committed to our care, and all consultations, are kept by us secret and strictly confidential.

PRELIMINARY EXAMINATIONS.

In some cases it may be advisable as a measure of prudence to order a preliminary examination. This consists of a special search, made at the U. S. Patent Office, Washington, through the medium of our house in that city, to ascertain whether among all the thousands of patents and models there stored, any invention can be found which is similar in character to that of the applicant. On the completion of this special search we send a written report of the result to the party concerned, with suitable advice. Our charge for this service, including the report, is ten dollars. This charge, though it involves the expense just named, will usually prove satisfactory. If the same device has been before patented, the time and expense of constructing models, preparing documents, etc., will, in most cases, be saved; if the invention has been, in part patented, the applicant will be enabled to modify his claims and expectations accordingly. Many other obvious advantages attend the Preliminary Examination; although the strictest search does not always enable the applicant to know positively whether a patent can be had. Applications are often rejected because the Examining officer finds a description of the alleged invention in some foreign publication; or some other person has been previously rejected on an analogous device; or some other invention for a similar purpose but partially resembles the applicant's in its construction; or the Government makes an unjust or uncommon decision. Against none of these contingencies does the Preliminary examination provide; it will, however, generally inform the applicant whether an improvement similar to his, and used for the same purpose, has ever been patented or not in this country.

Parties desiring the Preliminary Examination are requested to remit the fee (\$10), and furnish us with a sketch and description of the invention,

CAVEATS.

A caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat, is that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, and which is adjudged to be novel, and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for this service varies from \$15 to \$20. The Government fee under the new law is reduced to \$10; and this sum does not apply, as heretofore, as part of the fee on presenting an application for a patent.

Inventors will oftentimes find it very important to take advantage of the caveat system—the expense under the law being comparatively small. To enable us to prepare caveat paper, we only require a sketch and description of the invention; no model being necessary.

EXPENSE OF APPLYING FOR A PATENT; REJECTIONS, ETC., ETC.

Under the new law, the Government fee, on filing an application for a patent, is fifteen dollars; and if the patent is allowed, twenty dollars additional is required. If rejected, the first fee of fifteen dollars is all that is demanded. English, French, Austrian, Spanish, and American patents, of every nationality, may now obtain patents in the United States upon the same terms as our own citizens. The only discrimination made is against subjects of governments that discriminate against the inhabitants of the United States.

To the foregoing official fees must be added the attorney's fees for preparing the various documents and drawings. Our charge for preparing a case, presenting it to the Government, and attending to all business connected with it, until a decision is given, is generally thirty dollars; but the charge is higher if unusual labor is involved. If the patent is granted no further agency expenses ensue. If the application is rejected we cause a thorough investigation to be made into the reasons presented by the Commissioner for

refusing the patent. In making this examination we have access to all the drawings, models, books and specifications cited in reference, and we report the result as early as possible to our client. For this service we make no charge. If the rejection proves to be an unjust one, which sometimes happens—it can generally be reversed, and the patent obtained by contesting the case. For this prosecution we charge a fee proportionate to the extra labor involved, payable only on the issue of the Patent; but our demand will be reasonable and satisfactory to our clients, and will be arranged beforehand by special agreement. No risk whatever will be made, unless we succeed in procuring the grants of Letters Patent.

GENERAL REMARKS.—For the information of applicants, we would state that some agents are in the habit of charging for the preparation of the case, and, having no further facilities, decline all investigation or prosecution when rejected. Others, also, having no facilities of their own, advise their clients to go to the expense of procuring official copies of the drawings and specifications of all the references. Again, others are in the habit of charging a high price at the outset, in which they include the cost of prosecuting the case, if by them deemed necessary. Under this system, if the patent issues, or is justly rejected, no further prosecution is needed, but the inventor has paid full price for a service not waited and never rendered.

Our object in making the above statement is, not to reflect upon the manner in which other agents conduct their affairs, but simply to have our own method of doing business clearly understood.

The system adopted by us works well, gives general satisfaction, and presents to all applicants, rich or poor, an equal opportunity of having their inventions prepared, conducted, and prosecuted in the best manner, by experienced attorneys, upon the most moderate terms. Inventors who have rejected cases, prepared either by themselves or for them by other agents, and desire to ascertain their prospects of success by further efforts, are invited to avail themselves of our unequalled facilities in securing favorable results. We have been successful in securing Letters Patent in hundreds of such cases. Our terms for such services are very moderate.

MODELS, REMITTANCES, ETC.

The law requires that the inventor shall, in all cases, furnish a model, which must not exceed twelve inches in any of its dimensions; it should be neatly made, of hard wood or metal, or both, varnished or painted; the name of the inventor should be engraved or painted upon it conspicuously. Where the invention consists of an improvement on some known machine, a full working model of the whole will not be necessary. It should be sufficiently perfect, however, to show, with clearness, the nature and operation of the invention.

As soon as the model is ready, it should be carefully boxed and shipped by express or otherwise, to our address, namely, J. Silversmith, Government House, Rooms 20 & 21, San Francisco. Prepay the expense, and send express receipt to us by mail.

Simultaneously with the model, the inventor should also send us the first installment of the Government fee, fifteen dollars. The money may be forwarded either by express, with the model, or by mail. The safest way to remit is by draft on San Francisco payable to our order. Always send a letter with the model, and also with the remittance, stating the name and address of the sender. We sometimes receive envelopes containing money, but without any explanation; models are also frequently sent us from persons unknown to us.

A full written description should also be sent with the model, embodying all the ideas of the inventor respecting the improvement.

On the reception of model and Government fee, the case is duly registered upon our books, and the application proceeded with as fast as possible. When the documents are ready, we send them to the inventor by mail, for his examination, signature, and affidavit, with a letter of instruction, etc. Our fee for preparing the documents is then due, and will be called for. The case will then be presented to the Patent Office, and as soon as the patent is ordered to be issued, the applicant will be notified to remit the last installment of the Government fee, namely, \$20.

Inventors who do business with us will be notified of the state of their application in the Patent Office, when it is possible for us to do so. We do not require the personal attendance of the inventor, unless the invention is one of great complication; the business can as well be done by correspondence.

When the invention consists of a new article of manufacture, or a new composition, samples of the separate ingredients, sufficient to make the experiment, and also of the manufactured article itself, must be furnished.

The average time required to procure a patent, when the case is conducted at our agency, is three months. We frequently get them through in less time; but for preparatory cases, owing to delay on the part of the officials, the period is sometimes extended to four or five months, and even more. We make a special point to forward our cases as rapidly as possible.

RETURN OF MODELS.

Under the new law, if the applicant's case has been rejected, he is entitled to withdraw his model from the Patent Office.

This law applies also to all past rejected cases, and if parties wish to obtain their models through us, they can do so at a small expense.

DESIGNS, TRADE-MARKS, LABELS, ETC.

Under the new law, patents may be taken out for any new form of any article, also for tools, patterns, castings, machine-frames, stove-plates, holders, fringes, all new designs for printing, weaving, or stamping upon silks, calicoes, carpets, oil-cloth, prints, paper-hangings and other articles. Trade-marks, labels, envelopes, boxes and bottles for goods, may also be patented; likewise all works of art, including prints, paintings, busts, statues, bas-relief, or compositions in alto, or basso-relievo, new dies, impressions, ornaments, to be placed upon any article of manufacture, architectural works, etc. The terms for which these patents are granted varies according to the fee paid by the applicant, as follows:

Patent for 3 1/2 years	\$10.
" 7 "	15.
" 14 "	30.

No models are required. But duplicate drawings must be furnished, together with the usual specification, petition and affidavits, which, to render the patent of value, should be prepared with the utmost care.

Our facilities for the prompt preparation and securing of patents are of the most extensive character, and our charges are very moderate.

INFRINGEMENTS.

The manufacture, sale, or use, of a patented article, without consent of the owner of the patent, is an infringement, and subjects the infringer, by injunction from the Court, to an arrest or prohibition from the employment of his machinery, shop, works, factory, and men in the production of the article.

In addition to injunction, the infringer is liable to be mulcted in treble the amount of damages awarded by the jury. The maker, the workman, the seller, and the purchaser, if a user, are all liable, either collectively or individually.

Having access to all the patents, models, public records, draw logs, and other documents pertaining to the Patent Office, we are prepared to make examinations, and give opinions upon all infringement questions, advise us to the scope and ground covered by patents, and direct with vigor any legal proceedings therewith connected. Our charge will be moderate, and proportionate to the labor involved.

Address all letters of inquiry to J. Silversmith, Government House, rooms 20 & 21, San Francisco.

APPEALS.

In rejected and other cases, the new law provides for an appeal from the Examiner-in-chief to the Commissioner in person, on the payment of a fee of twenty dollars. A further appeal may be taken from the decision of the Commissioner to the U. S. Court of the district of Columbia. These appeals are heard by any of the Judges before whom the applicant elects to bring the case. No jury. All the papers, models, etc., are sent by the Commissioner to the Judge, who then reviews the case, and either sustains or reverses the Commissioner's decision. The party taking the appeal pays an official fee of twenty-five dollars. The Judge appoints a day of hearing. The applicant can appear in person or by counsel to state his case and file a written argument. Five days are allowed the appellant to put in an answer, and a similar period to the appellant for a closing reply.

Many important cases are brought before the Judges on appeal, and the decisions of the Commissioner are not unfrequently reversed.

We have had successful experience in conducting these appeals and our services can be retained on moderate terms.

INTERFERENCE.

When an inventor happens to apply for a patent when another application for a similar device is pending at the Patent Office, the two cases are declared by the Commissioner to interfere, and each party is notified to present evidence as to the date when he first invented the thing. He who proves the priority of invention receives the patent, and the other applicant is rejected.

Even after a patent has been granted, another inventor may come forward and apply for a patent for the same device; and if he can prove priority of invention the Commissioner will issue a patent to him.

The taking of evidence in interference cases is a sort of private inquest. It is not necessarily a Court proceeding. Subpoena can be issued and compulsory process employed to cause the parties to testify.

The management of interference is one of the most important in connection with Patent Office business.

Our term for attention to interferences are moderate, and dependent upon the time required. Address all letters to J. Silversmith, Government House, San Francisco.

SUGGESTIONS ABOUT FOREIGN PATENTS.

AMERICAN inventors should bear in mind that, as a general rule, any invention which is valuable to the patentee in this country, is worth equally as much in England and some other foreign countries. Four patents—American, English, French and Belgian—will secure an inventor exclusive monopoly to his discovery among one hundred millions of the most intelligent people in the world.

The cost of business and steam communication are such, that patents can be obtained abroad almost as easy as at home. The majority of all patents taken out by Americans in foreign countries are obtained through the Mining and Scientific Press Patent Agency. Having established agencies at all the principal European seats of Government, we obtain Patents in Great Britain, France, Belgium, Prussia, Austria, Spain, etc., with promptness and dispatch.

A Circular containing further information and a synopsis of the Patent Laws of various countries, will be furnished on application to J. Silversmith, Government House, San Francisco.

It is generally much better to apply for Foreign Patents simultaneously with the application here; or if this cannot be conveniently done, as little time as possible should be lost after the patent is issued, as the laws in some foreign countries allow patents to any one who first makes the application, and in this way many inventors are deprived of valid patents for their own inventions. Many valuable inventions are yearly introduced into Europe from the United States, by parties ever on the alert to pick up whatever they can lay their hands on, which may seem useful.

Models are not required in any European country, but the utmost care and experience is necessary in the preparation of the specifications and drawings.

When parties intend to take out foreign patents, engravings should not be published until the foreign applications have been made.

Carex.—It has become a somewhat common practice for agents located in England to send out circulars soliciting the patronage of American inventors. We caution the latter against heeding such applications, or they may otherwise fall into the hands of irresponsible parties, and thus be defrauded of their rights. It is much safer for inventors to intrust their cases to the care of a competent, reliable agent at home.

While it is true of most European countries, that the system of examination is not so rigid as that practiced in this country, yet it is vastly important that inventors should have their papers prepared up by the most competent solicitors, in order that they may stand the test of a searching legal examination; as it is a common practice, when a patentee finds a purchaser for his invention, for the latter to cause such examination to be made before he will accept the title.

It is also very unsafe to intrust a valuable invention in any other than a dealer of known integrity and ability. Inventors should beware of speculators, whether in the guise of Patent Agents or Patent Brokers, as they can not ordinarily be trusted with valuable inventions.

NEW DISTRICT.—A new mining district has been discovered and organized at or near the Elbow Ranch, seventy-nine miles from Carson, on the Esmeralda Road. We understand that some very flattering prospects have been found. The new discoveries daily being made confirm the opinion we expressed some time since, that the day was not far distant when the whole range of hills from Virginia to Esmeralda would be but one mining camp.

THE HUMBOLDT RIVER MINES.—A correspondent of the *Bulletin*, writing from Silver City, U. T., on the 24th of April, says silver from the Humboldt river has just been assayed here which yields \$16,000 to the ton, as I am informed by a party who is interested in the lead. Parties from the vicinity are leaving daily, hoping to find another Ophir in value, and their prospects are good—if accounts from there are correct.

ANOTHER STRIKE.—Bacon, Bowes & Co., at Gold Hill, have struck their ledge, about one hundred and sixty feet from the mouth of the tunnel. The width of the ledge is yet undetermined, but supposed to be from twenty-five to forty feet. The quality of the rock is as good as that found in the far-famed claims adjoining.

NEW COPPER DIGGINGS.—The people of the town of Knight's Ferry were considerably excited last week by the discovery of rich and extensive copper-lodes at Mineral Springs.

SALES MINING STOCKS.

(Revised and corrected every week.)

The sales of Mining Stocks for the past ten days have been as follows:

Considerable activity in mining sales during the last ten days up at Virginia City!

Potosi, \$200 per share.
Central, \$700 per share.
Ophir, \$1000 per share.
Gould & Curry, \$320 per share.
Coblar, \$16 per share.
Lucerne, \$25 per foot.
St. Louis, \$6 per foot.
Mount Davidson, \$25 per share.
Mark Anthony, \$15 per foot.
Louise, \$16 per foot.
Maston, \$5 per foot.
Bradley, \$10 per foot.
Post, \$6 per foot.
Lacy \$5 per foot.
Sacramento, \$5.
Shelton Co., \$8 per foot.
Josephine, Flowery, \$8.
West Branch, Flowery, \$10.

Corner Front and Taylor Streets, Portland, Oregon.

Having had three years' experience in the Fruit Trade in this market, and a thorough knowledge of the business, they feel confident in their ability to give satisfaction to all who favor them with business. Fruit-growers who consign to us, will be kept well posted in the changes of the market, and in all that pertains to their interest.
A liberal share of patronage is respectfully solicited. Jn4

TO OUR FRIENDS AND THE PUBLIC AT LARGE.

J. C. MEUSSDORFFER, HAVING RETURNED FROM HIS BUSINESS VISIT TO PARIS, desires to invite the whole hat-wearing community to favor him with a visit, and inspect the largest and most beautiful assortment of

Gents', Ladies, Misses, Youths' and Infants' Hats and Caps,

Ever exhibited west of the Atlantic. They were selected by Mr. Meussdorffer himself, who has eleven years experience in this State, and who feels confident that all, even the most fastidious, can be suited.

Our Department for Ladies and Misses contains, among others, the following new styles:

EMPERE EUGENIE, ANDALOUX MARRON, IRLANDAISE MONLOW,
BOLEDO MONLOW, IRLANDAISE GISELLE, BOLEDO MARRON,
TUDOR NOIR, FRANCOIS FANTASIE.

Our extensive arrangements in Paris and New York enable us to sell any kind of Hats at least fifteen per cent cheaper than any of our competitors. Mr. M., having had some very superior MOLESKIN PLUSHES manufactured expressly for him at Lyons, is prepared to produce a finer MOLE HAT than was ever before manufactured. Our prices are:

No. 1 Extra Super Moleskin Hats, made to order, \$8
No. 1 " " " " " " 6
No. 1 " " Silk " " " 5
Imported " " " " " 4

Meussdorffer's stock of SOFT HATS, CAPS and STRAW HATS, is the largest in the State, and receives additions of the newest styles by every steamer from Paris and New York.

Every one and all,
Please give us a call,

Mills—no other party being connected with it. ap19

ASTROLOGER.
REMOVAL TO NO. 530 CALIFORNIA STREET, SIX DOORS
ABOVE MONTGOMERY STREET.

Prof. COHEN begs to inform his friends and the public gen-
erally, that he has removed his office three doors above his
former location.
Ladies and gentlemen, if you want to avoid trouble
and misfortune, go and see the celebrated ASTROLOGER, PROF. COHEN. He
has convinced many of his visitors that he is the only living Astrologer who
is able to give correct information of the PAST, PRESENT and FUTURE, on
Business affairs, Matrimony and sickness, any subject they may require; and
he offers his services with entire confidence that he can give perfect sat-
isfaction through his natural gifts and knowledge.
Prof. COHEN will draw an Astrological Diagnosis in cases of illness,
and will prescribe for and guarantee a perfect cure.
Consultation Hours.—From 9 to 12 A. M., and from 2 to 11 P. M. every
day. Consultations can be had in five different languages, including Ger-
man. Consultation fee, two dollars, and by letter, five dollars. Address let-
ter box 1697, or through Wells & Fargo's Express.
P. S.—When personal consultations are had, the age of the person is not
required, but by letter it is necessary.
Four Reception Rooms are fitted up in elegant style for the comfort of vis-
itors. Consultations can be engaged in advance for any hour agreed upon.

59 and 61 Sansome Street.

VULCAN IRON WORKS CO.
P. TORQUET, MANAGER.
STEAM ENGINE BUILDERS, BOILER MAKERS, IRON FOUNDERS AND
General Engineers, First street, near the Gas Works, San Francisco.
Steamboat Machinery built and repaired; also, Saw, Flour and Quartz
Mills, Pumping and Mining Machinery, etc.
The Vulcan Iron Works Co. invite the attention of Quartz Miners and
others interested to their new style of Portable Dry Crushing Batteries with
wrought-iron framing. feb15

FIRE INSURANCE.
The undersigned offer insurance in the following
well-known first-class companies, on the most favorable terms:
Hartford Fire Insurance Company, Hartford.
Phoenix Insurance Company, do.,
Merchants' Insurance Company, do.,
City Fire Insurance Company, do.,
Charter Oak Insurance Company, do.,
McLEAN & FOWLER, Agents,
Office—Northeast Corner of Clay and Battery Streets.
ap4

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission
and Howard, San Francisco, California.—By recent additions to our
extensive establishment, we can confidently announce to the public
that we now have
The Best Foundry and Machine Shop on the Pacific Coast.
With upwards of forty-five thousand dollars worth of patterns, we are en-
abled to do work cheaper and quicker than any other establishment on this
side of the Rocky Mountains.
We make to order, and have for sale, High and Low Pressure Engines,
both Marine and stationary; Straight Quartz Mills of all sizes and
designs; Stamp Shoes and Dies of iron, which is imported by us expressly
for this purpose—its peculiar hardness making shoes and dies last two or
three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang,
Sash, Mulby, and Circular Saw Mills; Shingle Machines, cutting 25,000 per
day, and more perfectly than any now in use. One of these shingle machines
can be seen in operation at Metcalf's mill in this city.
Knox's Amalgamators, with the latest improvements; Howland & Hans-
com's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now
in use.
Quartz Screens, of every degree of fineness, made of the best Russian Iron.
Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers;
Smut Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lam's Pa-
tent; and to make a long story short, we make castings and machinery of
every description whatever; also, all kinds of Brass Castings.
Steamboat work promptly attended to.
Thankful to the public for their many past favors, we would respectfully
solicit a continuance of their patronage. Before purchasing, give us a call
and see what we can do. GODDARD & CO

ADVANTAGES
—OF—
BRYAN'S IMPROVED MILL.
THIS MILL will Crush, with the same weight
of Stamps, Twenty-Five per cent. more rock
than any other mill yet invented. It is also
Cheaper, more Durable and run with Less
Power. All parts of it being fitted together
before leaving the shop, it can be put up and
set at work Crushing the Ore, in Ten Hours af-
ter arriving on the ground!
Every one exclaims after seeing the Mill in
operation, "Why has not so perfect and yet
simple a mill been invented before?" It would
have Saved the Fortune of many a Miner
expended in worthless machinery, and enriched
the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS
Of all sizes, furnished with dispatch.
ADOPTED AND NOW USED BY
Eastern Slope Gold and Silver Company, } Washoe.
Bartola Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco.
Ogden & Wilson. }

THE VERMONT MOWER
—AND—
COMBINED REAPER AND MOWER,
FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated
Vermont Reaper and Mower, which is unsurpassed for Simplicity, Dura-
bility, convenience and thoroughness of work.
The high estimation in which this Machine is held by those farmers who
have used it, justifies the expectation that, with the late improvements, it
will become the leading machine, when its superior qualities are generally
known.
SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE
HAS OVER OTHERS, ARE AS FOLLOWS:
1st. Having the cutter bar hinged to the frame, so as to adjust itself to un-
even surfaces.
2d. Having two driving wheels, if one slips the other does the work.
3d. When the machine moves to the right or left, the knives are kept in
constant motion by one or the other of the wheels.
4th. It can be holed, thrown in or out of gear, without the driver leaving
his seat.
5th. The whole weight of the machine is on the wheels, where it is needed
to give power and stroke to the knives.
6th. When the machine is backed, the knives cease to play, consequently
you back away from obstructions, without danger of breaking the knives.
7th. The cutter-bar being hinged to the machine, can be picked up with-
out removing bolt or screw.
8th. The cutter bar is readily raised by a lever, which is very convenient
in the corners of the land; when raised, the machine will turn as short and
easily as any two-wheeled cart.
9th. It is mostly of iron, simple in construction, and a boy can manage it
easily.
10th. It has no side draft.
11th. The combined machine has two sets of cutter bars and sickles, one
for mowing, the other designed expressly for reaping, which, with other
improvements, should command the attention of every farmer.
We invite Farmers wishing a machine to call and see before purchas-
ing. KNAPP, BURRELL & CO.,

IMPORTANT TO INVENTORS.
ROBERT W. FENWICK,
LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCEN-
tific American Patent Agency, Messrs. Mun & Co., and for more than
ten years officially connected with said firm, and with an experience of
fourteen years in every branch relating to the Patent Office, and the interest
of inventors.
COUNSELLOR & AGENT IN APPLICATIONS
FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN
APPEALS TO THE CIRCUIT COURT.
Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.
[Directly opposite the Patent Office.]
N. B. Specifications and drawings of an invention, with all other busi-
ness pertaining to the obtaining of Letters Patent, will be executed for a fee
of \$25. For arguing the case in the event of a REJECTION, and for appealing
it to the Commissioner, no additional fee will be required. In cases of In-
terference or in an Appeal to the Circuit Court a reasonable extra charge
will be made.
For a fee of \$5, a preliminary examination will be instituted at the Pa-
tent Office, and reliable opinion given as to the probability of securing a
patent. More than four thousand examinations of this character were con-
ducted during the last four years by Mr. Fenwick.
The Government Fee is \$35.
FROM HON. CHARLES MASON, LATE COM. OF PATENTS.
WASHINGTON, D. C., Oct. 4, 1860.
Learning that R. W. Fenwick, Esq., is about to open an office in this city
as Solicitor of Patents, I cheerfully state that I have long known him as a
gentleman of large experience in such matters, of prompt and accurate busi-
ness habits and of unclouded integrity. As such I commend him to the in-
ventors of the United States. ap25 CHARLES MASON.

The Public should not fail to examine the Gallery of
MR. R. H. VANCE, corner Sacramento and Montgomery streets.

A Century of Inventions.

THE following curious and interesting account is given by one of the most scientific professors (the Marquis of Worcester), who lived and flourished in the year 1665, the manuscript of which is now in possession of the Beauford Buildings, London, giving the names and descriptions of such inventions as he could call to mind during his confinement in the Tower of London, each and all of which he asserted he could practically carry out. Worcester was the first to discover a mode of applying steam as a mechanical agent, and many of his contrivances have since been brought into general use; among them may especially be mentioned stenography, telegraphs, floating baths, speaking statues, carriages from which horses can be disengaged, if unruly, combination locks, secret escutcheons for locks, candle-moulds, etc.

We have not space to do more than quote the table of the inventions, which will convey some idea of their great variety:

1. Seals abundantly significant.
2. Private and particular to each owner.
3. A one-line cipher.
4. Reduced to a point.
5. Varied significantly to all the twenty-four letters.
6. A mute and perfect discourse by colors.
7. To hold the same by night.
8. To level cannons by night.
9. A ship-destroying engine.
10. How to be fastened from aloof and under water.
11. How to prevent both.
12. An unsinkable ship.
13. False-destroying decks.
14. Multiplied strength in little room.
15. A boat driving against wind and tide.
16. A sea-sailing fort.
17. A pleasant floating garden.
18. An hour-glass fountain.
19. A coach-saving engine.
20. A balance water-work.
21. A bucket fountain.
22. An ebbing and flowing river.
23. An ebbing and flowing castle clock.
24. A strength-increasing spring.
25. A double-drawing engine for weights.
26. A to-and-fro lever.
27. A most easy level-draught.
28. A portable bridge.
29. A movable fortification.
30. A rising bulwark.
31. An approaching blind.
32. A universal character.
33. A needle alphabet.
34. A knotted-string alphabet.
35. A fringe alphabet.
36. A bracelet alphabet.
37. A plucked glove alphabet.
38. A sieve alphabet.
39. A lantern alphabet.
40. An alphabet by the smell.
41. An alphabet by the taste.
42. An alphabet by the touch.
43. A variation of all and each of these.
44. A key-pistol.
45. A most concealed tinder-box.
46. An artificial bird.
47. An hour water-ball.
48. A screwed ascent of stairs.
49. A tobacco-tongs engine.
50. A pocket-ladder.
51. A rule of graduation.
52. A mystical jangling of bells.

53. A hollowing of a water-screw.
54. A transparent water-screw.
55. A double water-screw.
56. An advantageous change of centers.
57. A constant water flowing and ebbing motion.
58. An often discharging pistol.
59. An especial way for carabines.
60. A flask charger.
61. A way for muskets.
62. A way for a harquebus, a crock, or ship musket.
63. For sakers and minyons.
64. For the biggest cannon.
65. For a whole side of ship-muskets.
66. For guarding several avenues to town.
67. For musketoons on horseback.
68. A fire water-work.
69. A triangle key.
70. A rose key.
71. A square key with a turning screw.
72. An escutcheon for all locks.
73. A transmittible gallery.
74. A concealed door.
75. A discourse woven on tape or ribbon.
76. To write in the dark.
77. A flying man.
78. A continually-going watch.
79. A total locking of cabinet boxes.
80. Light pistol-barrels.
81. A comb conveyance for letters.
82. A knife, spoon or fork conveyance.
83. A rasping mill.
84. An arithmetical instrument.
85. An untoothsome pear.
86. An imprisoning chair.
87. A candle mould.
88. A coining engine.
89. A brazen head.
90. A priming gloves.
91. A dicing box.
92. An artificial ring-horse.
93. A gravel engine.
94. A ship-raising engine.
95. A pocket engine to open any door.
96. A double cross bow.
97. A way for sea-banks.
98. A perspective instrument.
99. An engine so contrived that working the *primum mobile* forward or backward, upward or downward, circularly or cornerwise, to and fro, straight, up-right or down-right, yet the pretended operation continued and advanced; none of the motions above-men-

Copper.

OUR fellow-citizen, Mr. T. Lewis, has presented us some specimens of exceedingly rich copper ore from his claim in Salt Spring Valley. They are now taking out ore which averages a net produce of \$160 to the ton, while many specimens, in large masses, appear to be nearly pure. We are gratified at Mr. Lewis' good fortune; for a more deserving, hard-working business man we know of nowhere. So far, the company have shipped their ore to the States for smelting, but they will soon erect the proper works for that business on their own ground, and the work will be done by themselves, saving a very large per cent now paid in expenses of transportation, etc., and adding one more element to the success of home manufactures.

In noticing this course of trade, the Stockton *Argus* of the 1st instant says: A six-mule team with copper ore from the Keystone Company's claim, at Salt Spring Valley arrived in town yesterday, and added its freight to the already large accumulation of ore on the wharf waiting shipment. About 100 tons of ore have been received by the shippers in this city, and will go East, for smelting, by the first clipper that takes her departure from San Francisco.—*Etc.*

tioned binding, much less stopping, the other; but unanimously, and with harmony agreeing, they all augment and contribute strength unto the intended work and operation; and therefore I call this a semi-omnipotent engine, and do intend that a model thereof be buried with me.

99. How to make one pound weight to raise one hundred as high as one pound fallet, and yet the hundred pounds descending doth what nothing less than one hundred pounds can effect.

100. Upon so potent a help as these two last-mentioned inventions, a water-work is, by many year's experience and labor, so advantageously by me contrived, that a child's force bringeth up an hundred feet high an incredible quantity of water, even two feet diameter. And I may boldly call it the most stupendous work in the whole world, not only with little charge to drain all sorts of mines, and furnish cities with water, though never so high-seated, as well as to keep them sweet, running through several streets, and so performing the work of scavengers, as well as furnishing the inhabitants with suffi-

cient water for their private occasions; but likewise supplying the rivers with sufficient to maintain and make navigable from town to town, and for the bettering of lands all the way it runs; with many more advantageous and yet greater effects of profit, admiration, and consequence; so that deservedly I deem this invention to crown my labors, to reward my expenses, and make my thoughts acquiesce in way of farther inventions. This making up the whole Century, and preventing any farther trouble to the reader for the present, meaning to leave to posterity a book, wherein, under each of these heads, the means to put in execution and visible trial all and every of these inventions, with the shape and form of all things belonging to them, shall be printed by brass plates. Besides many omitted, and some three of sorts willingly not set down, as not fit to be divulged, lest ill use may be made thereof, but to show that such things are also within my knowledge, I will here, in my own cypher, set down one of each, not to be concealed when duty and affection obligeth me.

Prospectus

OF THE
MINING AND SCIENTIFIC PRESS.
THE ONLY MINING, MECHANICAL AND SCIENTIFIC
PAPER ON THIS CONTINENT.

SECOND YEAR!

VOLUME III.—NEW SERIES!

A new number of this extensively circulated paper commenced March 30 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly or its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

J. SILVERSMITH, Publisher,

Rooms 20 and 21, Government House, Corner of Washington and Sansome streets, San Francisco.

The Oregon Fruit Trade.

IN the last issue of the MINING AND SCIENTIFIC PRESS, Messrs. Knapp, Burrell, & Co., who are extensively engaged in the fruit business, at No. 80 Washington street, presented our readers with an exceedingly interesting report of the Oregon fruit trade with San Francisco, from August 1860 to April 1861, inclusive; to which we inadvertently omitted to direct the special attention of our fruit raisers, and our readers generally. The gentlemen will please accept our thanks for their kindness.

Fruit Report

SAN FRANCISCO, May 1st, 1861.

EDITOR MINING AND SCIENTIFIC PRESS.—DEAR SIR:—In presenting another annual report of the Oregon fruit trade with San Francisco, we have little to offer further than a table showing the amount received during each month of the season, and the average price of sales. The first apples received were in the month of August, as follows:

	August.....	490 boxes 5c. to 12½c. per lb.....	Average 8c.
September.....	5271	" 4c. to 10c. "	" 5½c.
October.....	9200	" 4½c. to 7c. "	" 5½c.
November.....	15,650	" 6c. to 10c. "	" 7c.
December.....	24,573	" 4c. to 9c. "	" 6c.
January.....	8,240	" 4c. to 7c. "	" 5c.
February.....	10,612	" 5c. to 11c. "	" 7½c.
March.....	7,342	" 5c. to 11c. "	" 7c.
April.....	4,736	" 5c. to 19c. "	" 10c.
Total.....	85,914		

Making a total of nearly eighty-six thousand boxes, averaging 1¼ bushels per box, equal to one hundred and seven thousand five hundred bushels, in the estimate. Cherries, plums, etc., which come in small quantities, are not included, as we took account only of apples received. The average sale of the whole crop is about six cents per pound, perhaps a little above that figure, so that the total value of sales is somewhat over \$300,000.

Nowithstanding the reports, and general belief of a short crop, and the fact, that in some localities fruit was mostly cut off by early frosts, the result shows 14,000 boxes more received here than the previous year; which is accounted for by the large year's increase where so many young orchards are coming into bearing. There have been much improvement in the uniformity of size and style of the packages over former years.

During the early part of the season, it was well assorted and well packed, all small and inferior fruit having been rejected, and almost invariably arrived in fine condition.

By some shippers the same care and management was apparent throughout the shipping, and such invoices generally sold several cents above ordinary sales. Large quantities of Fall fruit was held back till December, with a view, probably, of obtaining better prices, which, coming in over-ripe and out of season, was sold for three cents per lb. less than the same fruit brought a month and six weeks earlier, besides considerable loss from decay. From about the 20th of November to the same time in December, there was received 30,000 boxes, an average of 1000 boxes daily, one-half of which was more than a month too late. The result was a glut in the market and a heavy decline in prices; occurring as it did just as the winter rains set in, rendering transportation in the interior both difficult and expensive. And it came forward at its proper season it would have arrived in good order, and at a time when the roads in the interior were good, and the demand sufficient to have taken it, with little or no decline in prices.

Again, to render the former error still worse, fully one third of it was too small and inferior to send to any market.

Since the winter fruit commenced there has been much small, inferior, worthless trash received, which had better been left under the trees on which they grew, which has been one of the principal causes of depressed prices.

The crop of peaches, and other early fruits of California production, was large, and the market through the Summer well supplied at moderate rates. Apples were brought to market before they were fairly ripened, to get them in before the Oregon fruit. Present appearances indicate a much larger fruit crop in California than any previous year, and a greater necessity will exist to send no inferior fruit.

Chosen fruit will without doubt find ample market at remunerative prices. At no very distant day, however, Oregon must seek some other outlet for her fruit products. This city can now boast of green fruit the entire twelve months and but few years will elapse, before it will be abundant and cheap at all seasons, and the produce of California soil.

Respectfully yours,

KNAPP, BURRELL & CO., 80 Washington st.

WITH real pleasure we place on our exchange list the MINING AND SCIENTIFIC PRESS of San Francisco. This is the only mining and scientific journal published on this side of the Pacific. Its pages abound with matter of the most important character to those engaged in mining and scientific pursuits. Subscribers can send their subscription, \$4 per annum, to J. Silversmith, editor and proprietor, at Government House, Rooms No. 20 and 21, San Francisco.—*Santa Barbara Gazette.*

Mining and Scientific Press.

A JOURNAL OF SCIENCE, ART, MINING, AGRICULTURE, MANUFACTURES, CHEMISTRY, INVENTIONS, ETC.

VOL. III.

SAN FRANCISCO, SATURDAY, MAY 18, 1861.

NO 8.

The adjoining engraving represents an improved amalgamator for the reduction of gold or silver ores, invented by Dr. J. B. Beers of this city, and will be more easily understood by those unacquainted with quartz mining, after having first pointed out the objects to be obtained or the qualities requisite for a good amalgamator—viz: It is well known that a large portion of the gold, when disengaged from the rock, is so coated or glazed over with sulphure or silicates, that it will not form a union with mercury until the surface has been entirely cleaned and brightened, either by friction or otherwise. But hitherto all efforts to accomplish this have proved abortive in a great degree, or been attended with a corresponding loss, by the grinding and consequent destruction of the mercury. To accomplish this purpose effectually, and without any grinding or loss of the mercury, is the principal object attained by this invention.

It is also a great labor-saving machine, not requiring one-tenth the labor and attention of an ordinary amalgamator, while the percentage of gold saved is nearly doubled.

AN IMPROVED AMALGAMATOR.

DESCRIPTION.

Fig. I. A A A, are a series of amalgamating pans, about four feet in diameter.

Fig. II. B is a sectional view of one of the false perforated riffle bottoms, upon which the grinding or triturating is done, and beneath which, and rising to near the surface, lies the mercury.

Fig. III. C, are the mullers or grinders, having a receiving hopper D, in the center of each, connected with the distributing channels, underneath, as shown in Fig. III; and through which all the pulverized ore is obliged to pass, being rubbed down and triturated upon the riffle bars, in close contact with a large surface of mercury, thus constantly reducing the ore in its passage, and setting more gold at liberty, yet in no instance grinding the mercury.

Fig. I. E, is the hopper from which the dry ground ore is fed by the spiral screw conveyor, driven by the belt H from the shaft, below. A small stream of water also accompanies the ore in its passage from the hopper.

G G are spouts leading the pulp into the receiving hoppers of the mullers. The mullers are shod with hard iron, which, together with the bottoms, are easily replaced at trifling cost.

Calaveras Mining.

MANY improvements, says the *Calaveras Chronicle*, have been made at Chile Gulch, in that county, during the last year. It is said that over a hundred tunnels now in operation, are paying from ten to twenty dollars to the man, a day, between Mokelumne Hill and Junction Store. We notice two large wheels, over thirty feet in diameter, were being propelled by water, which carries the machinery for raising water and dirt from the deep shafts. It takes about six inches of water to turn the wheels.

The gulch is now thoroughly prospected and pays good wages. These diggings will last for years. The lead has already been traced several miles. There is not a mining district in the State, which offers such inducements as this one in Chile Gulch. No township in the county is so rich in gold mining as Mokelumne Hill.

Chinese vs. American Miners—Terrible Affray.

THE *San Andreas Independent* of the 11th inst. gives the following account of a big fight that recently occurred in Calaveras county, which goes far to show what these coolies would do had they the power:

On the Calaveras, a short distance below Gearytown, are the headquarters of the Chinese mining population in this county. Some 150 or 200 of them are there huddled together in the space of a mile or less, in claims on bars, and in the bed of the river. A few white men are also at work in the same locality, perhaps as many as twenty-five in all—having been long in possession of claims, and having what is known among miners as the "first right" to water and dam privileges. These, immediately, after the subsidence of the late high water, reconstructed a dam in the river, which was necessary to the proper working of their claims. A few days ago, a company of Chinese cut a race through this dam, to the serious injury of the owner's rights. This was explained to them, and they were asked to desist. But they did not, and on the morning of the 9th instant, seven or eight of the white miners went to the place, and commenced filling up the race. They had not worked long before they were beset by 100 or more Chinese, with rocks and shovels and sticks. The whites had a rough time for a while, but fought so lustily that they ultimately drove the Chinese from the ground, with a considerable number of wounded, and one so badly used up that it is doubtful if he will recover. The Chinese had the whites arrested for assault and battery!

THE POTASI SILVER MINES.—The *Visalia Sun* has seen sundry certificates of assay of silver ore, which have been made by E. J. Smith of this city, from Potasi yields, and some of the assays show a value of forty-three dollars and fifty-seven cents to the ton of ore. The smallest amount was eleven dollars to the ton. The *Sun* thinks Potasi a humbug.

GYPSUM.—A valuable vein of this material has been discovered in the Coast Range, by Messrs. Hobbe and Gibbs.

DEPRECIATION OF GOLD DUST.

Owing, as is alleged, to the insecurity of treasure shipments to the East—Jeff. Davis's privateers being reported as lying in wait for such nice pickings and stealings—the bankers of San Francisco have raised their price for advancing coin one per cent, and the rates of exchange have been much enhanced, all which tends to lower the value of gold dust. Wells, Fargo & Co., and other gold dust buyers in the interior, have materially reduced the price, and in some instances utterly refused to purchase. In Nevada, the price of an ounce is twenty-five cents less than it was two weeks ago, and in Shasta the falling off is from seventy-five cents to a dollar and a quarter. The miners, unless pressed by their necessities, will not sell much dust at the present low prices, and the result will be that much of it will remain in the country that produced it. Not a very alarming evil at the worst, if the miners can stand it.—*Nevada Transcript*.

A STREAM OF COPPER.—Our city, says the *Stockton Republican*, bids fair to lose her ancient name of City of Windmills and City of Sloughs, and win that of the Copper Metropolis copper is pouring into our city at a perfectly amazing rate. It is not unrequently that a hundred tons are piled upon the Levee. The mineral is at present shipped to the East, but the smelting will soon be done here.

Discontented Miners.

How many hundreds, ay, thousands, are there in California, many of whom have been here since '49, who are living along from year to year in the expectation of amassing a sum sufficient to enable them to leave the State, and live in independence the balance of their lives in the East, and who would almost feel themselves insulted at a proposition to permanently settle here. This class of men are not satisfied with moderate wages, they are always prospecting for something "big," and nursing the delusive hope that they are bound to strike it sometime, regardless of the fact that they are spending their best days in penury and want and the thousand chances against their amassing a sudden fortune. How much happier would these people be, if they could but make up their minds to make California their homes, and apply their labor where they would be sure of a moderate remuneration, which would enable them to live comfortably and enjoy themselves in a rational manner, without dragging out a miserable existence, and depending upon a fallacious hope, which is bound to end in bitter disappointment. Better at once make up their minds to remain in California, and enjoy themselves as they go along.—*Herald*

GOOD STRIKE.—We learn that Messrs. Warfield, Jacobs Garretson, and Tyson, on Wednesday last, found a pocket in their claim on Quartz Hill, Scott River, out of which they took out the snug little sum of \$2,000. Surely the mines are giving out.—*Yreka Union*.

THE KNIGHT'S FERRY COPPER MINES.—A writer in the *Stanislaus Index* says that the mines at Copperopolis near Knight's Ferry, are yielding pure ore at the rate of \$150 to the ton. The surrounding country is filled with quartz lodes and mineral springs.

RICH QUARTZ.—The American Hill Mill, Nevada, elained up lately, in the neighborhood of \$6000, after a run of nine days.

Chloroform—Its Use and Utility.

You will please accept my unfeigned thanks for the room you have given me in your practical and interesting sheet for former articles that have appeared on the structure and formation of human teeth, their development, maturity and preservation; also, the two preceding articles on the use and results of chloroform. The articles alluded to have been offered for the general good of the reader and our people, and I trust most sincerely this, or any effort that your contributors make, will enhance the special interest of the public good.

There is a good axiom, emanating from a wise sage who has passed away, viz: "The possessor and contributor of knowledge of any specie or kind is a public servant for the commonwealth's good."

With propriety, and without the least egotism, this will opportunely apply to your efforts, by supplying our people with the many facts of a scientific character in the great range of subjects that you present before them. But not so much digression.

THE MODE OR MODES OF DIFFERENT OPERATORS.—The operator having satisfied himself that the patient is a suitable subject, he should now determine the potency of the article; this leads me to one of the most important conclusions in my mind, viz: the most of operators administer it too strong, and bring the subject in contact with its eliminations too soon.

I prefer a moderately strong article, and use a napkin in a cone-like form inverted; allow a good current of air; and cause the patient to breathe long breaths in the lungs and stomach, by which means it is well infused in the blood before it reaches the cerebral functions of the brain. It is this portion of the brain that you must suspend (fore-part). There is no agent but death that ever suspends the cerebellum (back and under part of the brain). And should the patient say during the operation all manner of things, still proceed, for it is the involuntary portion of the mind that speaks, not the sensorial and conscious.

After saturating the napkin well with chloroform, bring it gradually to the mouth and nose, and to facilitate a more happy effect sprinkle over the clothing and chest of the patient; let him gradually pass into a passive state.

Often you will find them rising up to make battle, or desiring to leave, but first keep a good hold of your subject, and a little further application, and you have him completely under your control. If extracting teeth, and you have any apprehension that you cannot open the patient's mouth, slip in a good sized cork, which you can take out at your leisure. I never give a quantity sufficient to keep a patient at any time insensible over ten minutes.

If I cannot take all out I wish during that time, I allow the patient to return to consciousness, and let him get plenty of air, and then place him under the influence again.

And this should be done in capital operations, alluded to in my first article. It is owing to the fact that operators keep a subject so long under its power that casualties occur that would not if they had been more careful and not so stupid.

Again, an operator should be expeditious* with his tools, instruments, needles and bistouries, rollers, and tourniquets.

I have seen some operators that would be seven, eight and ten minutes taking up an artery, when the limb should have been taken off, arteries tied, integuments and lapp made, rollers on, and all done up in seven minutes' time. Some operators use the sponge in administering it. This I find is a waste of time and chloroform. Others hold it direct to the nostrils, and allow the patient to close the mouth. To say the least, this is dangerous and should be deprecated. Let the operator ever keep in mind that the brain should be relatively affected, and not be directly brought into contact with any powerful agent whatever. It cannot be done unless there is a collateral issue not favorable.

There are many interesting cases on record, and within the routine of my practice daily, that no doubt would interest the reader, in regard to its operations, but this it is not my province or duty at present to give to the public.

If any head of a family, or any other responsible person, may wish to administer it, let him carefully read my hints concerning subjects proper to take it, which will be found in the second article of this series. Then procure a clean napkin, make it into cone form, the largest part towards the mouth and nasal apertures, and let the patient breathe two or three long and heavy breaths. After the cloth is well saturated, then for a moment let him breathe without the napkin. Then apply again, until the patient, of his own accord, becomes inactive. Then perform the operation.

Some persons are afraid of chloroform when the cork may be out of the bottle and in their hand. This is only a false premise. No person need be afraid of it by handling it. It will not do any harm to have it scattered all around the clothing or room, if you have access to air.

The only way that the midnight and stealthy assassin or burglar can commit their fearful depredations upon persons or in houses is by applying it in apartments where no fresh air can reach the victim.

Having premised all that is important on the character of chloroform, for its use and utility, I will close this series by reiterating the proposition that chloroform is an important and opportune agent for all persons suffering pain, when in intelligent hands.

W. H. IRWIN, M. D.

HISTORICAL SKETCH.*

Discovery of California Gold.

1. THE existence of rich and extensive gold mines in California was discovered by James W. Marshall, an American citizen, and a native of New Jersey, on the 19th of January, 1848. Gold had previous to that time been found, but in places where the mines were not extensive; their production was scarcely known to commerce, and their working after long years, led to no important results. Marshall's discovery speedily and directly exercised an influence throughout the world, and gave a new life to trade and industry in Europe and America.

Drake's Report.

2. THE first published report of gold in California, is in Hakluyt's account of Sir Francis Drake's visit to this coast in 1579. That voyager entered a bay, about latitude thirty-eight degrees, supposed to be the one now called Drake's Bay, twenty miles north-westward from the mouth of San Francisco Bay. If not the former it certainly was the latter bay. The historian of the voyage says: "There is no part of the earth here to be taken up wherein there is not a reasonable quantity of gold or silver." There is no statement that any of Drake's men penetrated into the interior, or made any search for these metals, or obtained any specimens of them; and since neither gold nor silver is found in the loose earth at either Drake's Bay or San Francisco Bay, we are justified in presuming the statement to be an impudent lie, written for the purposes of making the voyage appear important, giving interest to the narrative, and imposing on the ignorant and credulous.

Spanish Reports.

3. THE Spaniards and Mexicans who visited the coast at various times, by land and sea, and who were familiar with the indications of the precious metals and knew how to search for them, undoubtedly found gold at various places, particularly near the Colorado river; but they found no places rich enough to pay for the labor of working. The impression went abroad, however, that the country had great mineral wealth, and continued to prevail until the American conquest. It was only a vague rumor, and was published in several books, but it could not command the confidence of severe criticism.

Forbes and Maufrais.

4. IT is reported that silver was discovered at Alisal, in Monterey county, as early as 1802, and gold was found at San Isidro, in San Diego county, in 1828 (Maufrais, vol. 1, p. 335); but the former never yielded any silver worthy of note, and the latter had not been heard of in 1835, by Alexander Forbes, the historian of California, who wrote: "No minerals of particular importance have yet been found in Upper California, nor any ores of metals. In another place, referring to Hija's migration to California in 1833, he says: "There were goldsmiths [in the party] proceeding to a country where no gold existed." The first mine to produce any noteworthy amount of precious metal was the gold placer in the Cañon of San Francisco, on the ranch of the same name, forty-five miles north-westward from Los Angeles. This placer was discovered about the year 1838, and in 1842 the chief miner there was a Frenchman named Barea. This placer was wrought continuously from 1838 to 1848, when it was deserted for the richer diggings in the Sacramento basin. The total yield in ten years was probably not over \$60,000, a yearly average of \$6,000.

Dana.

5. IN 1842, the geologist and mineralogist of Wilkes' exploring expedition, visited California, and traveled from the northern boundary through the Sacramento basin to the bay of San Francisco, and soon after his return to the Eastern States in 1842 or 1843, he published a work on mineralogy, in which he asserted the existence of gold in California. I have not been able to find a copy of the first addition of his book, but a newspaper which has fallen into my hands gives the following quotations, presumed to be correct. Speaking of places where gold has been found, he mentioned—"California, between the Sierra Nevada and Sacramento and San Joaquin rivers.—On page 252 he says: "The gold rocks and veins of quartz were observed by the author in 1842 near the Umpqua river in Southern Oregon, and pebbles from similar rocks were met with along the shores of the Sacramento, in California, and the resemblance to other gold districts was remarked, but there was no opportunity of exploring the country at the time." Mr. Dana unquestionably discovered the existence of gold in California, either by direct vision or by inference, but it was a mere nominal discovery, creditable in a scientific point of view, but of no practical use. He did not find diggings that would pay, nor did his announcement set anybody to work to hunt for such diggings. His merit in so far as California is concerned, may be compared to that of Murchison's similar discovery of auriferous rocks, or rock indicating auriferous wealth in Australia. It did no good, and nobody paid any attention to it, until the paying diggings were found by Hargraves, many years later. As Hargraves is the hero of the Australian, so is Marshall of the Californian gold discovery.

Larkin.

6. BEFORE giving the account of his discovery, however, I

* Bancroft's Hand-book of Mining for the Pacific States.

will quote the following passage of a letter, written on the 4th of May, 1846, by Thomas O. Larkin, then U. S. Consul at Monterey, California, to James Buchanan, Secretary of State under President Polk:

"There is said to be black lead in the country at San Fernando, near San Pedro (now Los Angeles county). By washing the sand in a plate any person can obtain from one dollar to five dollars a day of gold that brings \$17 an ounce in Boston; the gold has been gathered for two or three years, though but few have the patience to look for it. On the southeast end of the Island of Catalina, there is a silver mine from which silver has been extracted. There is no doubt but that gold, silver, quicksilver, copper, lead, sulphur, and coal mines, are to be found all over California, and it is equally doubtful whether, under their present owners, they will ever be worked."

To Explorers, Discoverers, Prospectors, and Miners, on the Pacific Coast.

Muriate of Silver. (Horn Silver).

Geognostic Situation.—Primary rocks, with the other ores. It is a good ore for the extraction of the precious metal.

External Characters.—Color, pearl gray, greenish or reddish blue, yellowish or greenish white and brown. Occurs massive, investing other minerals, reniform, amorphous, and crystallized in tubes, octahedrons and acicular prisms. Luster, glistening and wavy. Soft, yields to the knife, and to pressure. Malleable. Feebly translucent. Becomes brown by exposure. Specific gravity = 5.5.

Chemical Characters.—Fusible in the flame of a candle. Before the blowpipe emits muriatic acid fumes. Rubbed on moistened zinc it leaves a film of silver.

Distinctive Characters.—Muriate of mercury is entirely volatile before the blowpipe, and does not leave a silver globule.

Composition.—Muriate of silver 88.7; oxyd of iron, 6; alumine, 1.75; sulphuric acid (oil of vitriol) 0.25.

Tests for Silver.—Dissolve the metal in nitric acid, put in a quantity of potash or soda, and it will give a dark olive precipitate; put in a piece of copper, metallic silver will fall down; common salt gives a white precipitate, and galls a brown precipitate. Its solution is called indelible ink.

4.—MERCURY.—This metal is sometimes found in the native state, but the ore or source whence the greater portion is obtained is the

Sulphuret of Mercury. (Cinnabar).

Geognostic Situation.—Occurs chiefly in new red sandstone; sometimes in a sort of mica slate, limestone, gneiss, graywacke, beds of bituminous shale, associated with black mineral resin, gray sandstone and limestone, clay, alluvium, and in rocks of the coal formation.

Extraction.—Mix the ore with its weight of lime or clean iron filings, and put into iron retorts; and after a receiver containing some water is luted on, set them on sand-baths, and give them a sufficient degree of heat to force the mercury over.

Assaying.—Same as Extraction, which see. By this process one hundred pounds of ore yield from six to ten ounces of mercury.

External Characters.—Color, scarlet or carmine, passing into cochineal red and lead gray; sometimes with a tinge of yellow. Occurs massive, and crystallized in acute rhomboids; some varieties have a fibrous structure. Translucent or opaque. Streak, scarlet red. Luster, adamantine, inclining to metallic; sometimes shining silky. Fracture, granular or fibrous. Sometimes occurs in thin plates or tubular crystals. Specific gravity = 8.

Chemical Characters.—Volatile before the blowpipe, with the odor of sulphur.

Distinctive Characters.—From sulphuret of arsenic, red silver ore, arseniate of cobalt, and red oxyd of copper, it is distinguished by its chemical character.

Composition.—Mercury 84.5; sulphur 14.75.

Tests for Mercury.—To a quantity of mercury dissolved in aquafortis, and fresh lime-water, result = an orange precipitate; immerse a piece of copper, result = metallic mercury; immerse a plate of iron, result = a dark powder.

5.—COPPER.—Geognostic Situation.—Occurs in beds, interbedded in various primary rocks, and as high in the secondary series as the new red sandstone; also in large blocks in alluvial districts; very rarely in tertiary rocks.

Extraction.—The oxyds and carbonates of this metal are reduced by simply heating them with charcoal in a wind furnace; but the sulphurets are reduced by a different and more difficult process. The ore is broken to pieces, and roasted to pieces in a furnace similar to a reverberatory, having a long chimney to increase the heat and to carry off the sulphur and arsenic. The roasting takes about twelve hours, the ore being frequently stirred. It is then put into a smaller furnace, and brought to a state of fusion, occasionally mixing it with a little lime. The impurities which collect at the top are raked out. The melted metal is drawn out through a hole in the lower part of the furnace, which was stopped by clay mixed with a little coal. The copper is conveyed into vessels suspended in a well, through which a stream of water runs. The metal being now in a granular state is repeatedly subjected to heat in a reverberatory, and each time put into the well. The slag which collects must be removed. The copper after this is kept at a low red heat for two days, then repeatedly fused, and cast into moulds. Lastly, it is put into the refining furnace with a little charcoal, in which

It is again fused and cast. The purest part of it rises to the top, and may be separated by a blow of a hammer.

Copper is obtained from the springs which contain this metal, by putting in pieces of iron. The matter deposited is then fused.

Assaying.—The ores must in the first place be roasted with a gentle heat. After this, it is to be pulverized and mixed with twice its weight of black flux in a crucible, and exposed to a strong heat of a smith's forge for about half an hour. Should the globules of revived metal not readily form a button at the bottom, a little salt thrown in will accomplish it.

The ores of copper present the following varieties :

Native Copper.

Geognostic Situation.—In the veins of primary and secondary rocks.

External Characters.—Color, copper red, tarnished externally, brownish black. Occurs dendritic, capillary, reniform and amorphous; also crystallized in cubes and octohedrons. Malleable. Specific gravity = 8.5.

Chemical Characters.—Fusible. Soluble in acids.

Composition.—Nearly pure copper.

Sulphur of Copper.

Geognostic Situation.—Found in almost every kind of repository in all the great classes of rocks; particularly in beds and veins in primary and secondary rocks. It is a valuable ore.

External Characters.—Color, blackish steel-gray, sometimes iridescent; internally lead-gray. Occurs massive, and in pseudomorphous crystals; also crystallized in long tabular six-sided prisms, and in double six-sided pyramids. Structure lamellar. Tessular. Cleavage easy with brilliant faces. Easily broken into grains. Fracture conchoidal. Specific gravity = 5.

Chemical Characters.—Soluble in hot aquafortis. Fusible.

Distinctive Characters.—Gray copper decrepitates under the blowpipe and is harder. This gives out only the fumes of sulphur.

Composition.—Copper 76.50; sulphur 22; iron 0.50.

Copper Pyrites.

Geognostic Situation.—Same as that of the preceding. It is one of the most abundant and valuable ores of copper.

External Characters.—Color, brass-yellow. Occurs dendritic, stalactical, amorphous, in concretions, and crystallized in tetrahedrons and dodecahedrons. Luster, metallic. Structure, lamellar. Crystals, small and seldom perfect. Cleavage, tessular. Yields to the knife. Fracture, commonly uneven. Specific gravity = 4.3.

Chemical Characters.—Fusible. Tinges borax green.

Distinctive Characters.—Iron pyrites does not tinge borax green. Native bismuth is lamellated, and native gold is malleable.

Composition.—Copper 40. to 35.3; iron 40. to 33; sulphur 20 to 35.

Gray Copper.

Geognostic Situation.—Accompanies the other ores of copper.

External Characters.—Color, steel-gray, passing into black. Streak, brownish. Occurs amorphous, disseminated, and crystallized in tetrahedrons. Luster, metallic. Crystals small. Specific gravity = 5.

Chemical Characters.—Fusible, but not easily reduced.

Distinctive Characters.—Specular oxyd of iron is magnetic; arsenical iron is harder, and gives out the fumes of arsenic when heated.

Composition.—Copper 52; iron 23; sulphur 14.

Red Oxyd of Copper.

Geognostic Situation.—Associated with the other copper ores.

External Characters.—Color, red. Occurs amorphous and crystallized in octohedrons and cubes. Structure, lamellar. Luster, metallic adamantine. Fracture, conchoidal and uneven. Translucent. Yields to the knife. Brittle. Specific gravity = 5 to 5.9.

Chemical Characters.—Fusible and easily reduced. Dissolves in aquafortis with effervescence; in muriatic acid, without.

Distinctive Characters.—Its chemical characters.

Composition.—Copper from 88.5 to 91; oxygen from 11.5 to 9.

Blue Carbonate of Copper.

Geognostic Situation.—In primary and secondary mountains.

External Characters.—Color, blue. Occurs massive, stalactical, incrusting, disseminated and crystallized. Fracture, imperfectly foliated, usually presenting broad fibers.

Chemical Characters.—Insoluble without a flux; with borax gives a green glass. Dissolves in aquafortis with effervescence.

Distinctive Characters.—Insoluble in water; does not become magnetic under the blowpipe.

Composition.—Oxyd of copper, 70; carbonic acid 24; water 6.

Tests for Copper.—To a solution of this metal present a plate of iron, result = metallic copper; potash, result = green precipitate; ammonia (hartshorn) result = blue color.

Copper melts at 1960°; it is ductile, malleable and tenacious; it is hard, elastic and sonorous.

[To be continued.]

Lithology.

There is a saying in old books of natural history, which is adopted by Linnaeus, that "Stones grow, vegetables grow and live, animals grow, live, and feel." This saying is untrue so far as stones are concerned, if the word grow is used in the same sense throughout. The growth of animals and plants is a process altogether different from that by which stones or any mineral substances are formed; and the term "growth," as describing an internal and spontaneous increase of substance, could never be properly applied to the formation or increase of the latter.

But we propose now to go into it a little more fully, and describe what was the method by which stones and rocks were formed. To do this fully we shall be obliged also to describe the method by which the external crust of the earth was produced; for we cannot explain the formation of any individual lumps or masses of rock, stone or earth, without also explaining how all the earthy matter which is anywhere open to our examination over the whole face of the globe came into its present form and condition.

And here a difficulty meets us at the outset, which is quite right we should overcome before we go any further. Until the science of geology was properly understood, people naturally imagined that the earth was originally created very nearly as we now find it. Just as, till the science of astronomy was properly understood, they as naturally imagined that the sun went round the earth, instead of the earth round the sun. Neither of these sciences or any other of the natural sciences, was made the subject of revelation, and, therefore, there is nothing in the Bible to enlighten us on these points. Incidental expressions are used therein which seem rather to favor the common notions; but that is to be expected, because we have no reason to suppose that the sacred writers were supernaturally enlightened on such matters, and they therefore necessarily used the expressions which would naturally occur to them. There is nothing in the science of astronomy, or in that of geology, at all opposed to any of the great doctrines of revealed religion, and some of the most pious and most eminent divines of all forms of the christian religion, without exception, have been, and still are, eminent geologists. When, therefore, we speak of the earth as having passed through many different states, and as having existed as an habitable globe through untold ages anterior to the creation of man, we speak of things which the Bible does not contradict, but simply says nothing about them.

Geology does not pretend to explain the origin of the earth. Some people have supposed it once to have existed as a gaseous body, and after that as a mass of molten matter.

We will not discuss the question, but we will take the earth as we find it—a globe, the surface of which is composed of land and water—surrounded by an atmosphere of air, producing rains, winds and snows,—and from the interior of which are here and there vomited forth molten masses of stone called lava, accompanied by cinders and ashes, that produce mountains which we call volcanoes. On the earth in this state there are two principal agencies at work producing new rocks, these agencies are fire and water.

IGNEOUS ACTION.—Suppose we take that of fire first, as the most striking and obvious.

What happens at the eruption of a volcano? We all know that vast quantities of powder, dust, sand, and ashes are blown out of the interior of the mountain, and fall all over the country round its foot. In some of the tremendous eruptions in the larger volcanoes of the globe these materials have been carried even hundreds of miles, in quantities sufficient to darken the air, and have fallen in quantities sufficient to make a layer of some inches at that distance, and of many feet in the immediate neighborhood of the mountain.

Streams of molten lava, many hundred yards in breadth, many feet in depth, and many miles in length, have flowed from volcanoes into the lowlands around them, or into the sea near their foot. These streams of lava, when cooled, form masses of dark heavy rock, the upper of which is often cindery and porous, but the inside and lower portion close-grained or compact, hard solid stone.

The showers of ashes, in like manner, when they accumulate to any thickness, become sometimes compressed below by the pressure of their own weight, into a compact stone, of greater or less hardness and solidity according to circumstances. Those parts that fall into the sea of course become saturated by its water, and gradually sink to the bottom, forming first mud and afterwards stone.

Very often springs, containing the substance called carbonate of lime or perhaps some other mineral matter in solution, and which are therefore often called petrifying springs, gain access to these beds of ashes, and aid in hindering them together in a firm and solid rock.

On the flanks and in the neighborhood of volcanoes alternations of these deposits of lava and ashes take place through the lapse of ages till they form very large masses. The thickness of such accumulations over some parts of Heroulaeum, for instance, is more than one hundred feet.

On examining any great volcanic district, we find that whole mountains, and even great chains and ranges of mountains, are either entirely or in very large part made up of these accumulations; so that we must conclude that these ranges of mountains have been gradually formed by the process of successive eruption and outpouring, and the consequent piling up, of materials proceeding from the interior of the earth. In other words, we arrive at the conviction that there was a time when these particular mountain masses did

not exist, when their materials were buried in the interior of the earth instead of being heaped up on its surface. Compared with that time therefore all the rocks comprising these volcanic mountains are newly formed, and fresh ones are even now occasionally added to them before our eyes.

When, moreover we come to travel over the globe, we find many other mountainous regions which are not now volcanic, or at least from which no outbursts of fiery matter have proceeded within the periods of history or tradition, which are yet so obviously made up of lava and ashes that we have no hesitation in attributing to them a volcanic origin.

There are therefore large masses of rock and stone on various parts of the earth's surface which have been formed by the agency of fire. We shall see presently that we shall have to attribute to the same agency, in rather a different form, still larger and more extensive masses.

AQUEOUS ACTION.—Let us now examine those rocks and stones that have been formed by the agency of water. Water may act in two ways. It may either dissolve mineral matter, as it does salt for instance, or it may wear it away bit by bit.

We all know that "constant dropping wears away stones," and we have all seen under spouts or pumps, where the dripping of water has taken place for any considerable time, hollows worn in stones placed underneath them.

There are some minerals, like salt, that are easily dissolved by water, some, like carbonate of lime, that can only be dissolved slowly and partially, and when the water contains some acid; others, again, like siliceous and alumina, on which water may be said generally to exert no dissolving power. When, then, water wears away stones, consisting wholly or chiefly of siliceous or aluminous particles, it is clear that it does so not by dissolving but by removing them. Its weight and motion, and friction gradually loosen and tear asunder the little particles of which such stones are composed, and when loose wash them away.

This action may be called a mechanical action, because the water acts like a machine, and the dissolving action may, in like manner, be called a chemical action, being one of the many processes familiar to us in chemistry.

CHEMICAL.—Now suppose we follow these processes out to their results. The water which has dissolved mineral matter in one place, and under one set of circumstances, may of course be made by an opposite set of circumstances to re-deposit it, just as salt dissolved in water may be recovered by causing the water to evaporate. Water, therefore, containing carbonate of lime in solution may deposit it ultimately as limestone. It does this continually in many caverns, on the sides of many springs, in the arches of aqueducts, and along the banks of brooks, in either pendant masses like icicles, or encrusted masses on the ground, or round sticks, stones, and other substances.

It is obvious that what we see thus taking place on land, may be still more abundantly occurring at the bottoms of seas and lakes, especially when the purely chemical forces are modified by the actions of life in solidifying mineral matter. All the corals and shells, and multitudes of starfishes, crabs, lobsters, and other marine animals, whose hard parts consist chiefly of carbonate of lime, must derive it from the waters of the sea. Some coral reefs, as those on the northeast coast of Australia, are a thousand miles in length, with an average breadth of fifteen or twenty miles, and a maximum thickness at their outer part of probably, at least two thousand feet. Every part of this huge mass consists of carbonate of lime, separated particle by particle from the waters of the sea, by the processes of life going on within the bodies of marine animals.

All the adjacent seas for hundreds of miles, wherever any particles have been brought up the sounding-lead from the bottom, are found to be strewn with fine calcareous mud, derived from the waste of these reefs.

We know, then, that in many parts of the globe a purely chemical precipitation of carbonate of lime is taking place, producing varieties of limestone, and we know that the bottoms of our present seas this precipitation is aided by means of the organic chemistry of animal life in producing vast deposits of the same substance.

Now, all rocks and stones thus formed from mineral matter that has been held in solution by water may be called chemically-formed rocks. These may be said to consist of:

All limestones or rocks composed of carbonate of lime, including stalactite, stalagmite, tufa, travertine, chalk, oolite, common limestone, statuary marble, and most other marbles. When limestone contains a considerable proportion of carbonate of magnesia, mingled with the carbonate of lime, it is called a magnesian limestone, or sometimes a *dolomite*.

Rocks composed of sulphate of lime, commonly called gypsum, and locally alabaster or plaster-stone. This substance occurs either compact, when it looks like a white, soft, earthy limestone; or crystalline, when it is often fibrous, pure transparent crystals of it being called *selenite*.

Rocks composed of chlorid of sodium, known as rock-salt; these occur generally as thick beds associated with clay or marl, the salt being in a rudely crystalline and semi-transparent form, often stained to the color of the marls with which it is associated.

All these chemically formed rocks have one character in common, namely, that they have frequently a crystalline structure, being made up of an assemblage of crystals of their respective minerals, all interlocked one with the other. This crystalline structure is always a proof of the rock having been once fluid, either by its having been dissolved in water or melted by heat.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY MAY 18, 1861

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., N.Y.

The Coal Fields of Mount Diablo.

WHEN we reflect upon the effect the existing lamentable condition of affairs on the other side of the continent will have upon home industry; how workshops and factories of every description will be multiplied in California, for the production of articles for home use, and even for exportation it may with safety be said that the recent discoveries of coal at the base of Mount Diablo are providential. Wood or coal is needed to drive machinery, where water power does not exist. Wood is growing scarcer as each year rolls by, and coal from abroad has always been held at high rates in this State. It is especially fortunate, then, we say, that at this juncture it should have been found in sufficient quantity to justify extensive working. Already, though but a few months have passed by since its discovery, large quantities have been brought to this market, reducing the price very materially, to the great gratification of consumers.

Professor Whitney, the State Geologist, recently visited the coal region, and is of the opinion that it is very extensive and will yield handsomely for a long time to come. Since his visit to Mount Diablo, he has lectured upon the subject before the Legislature, giving the result of his scientific observations, which we regret cannot at present be laid before our readers.

On Monday evening last Prof. W. P. Blake, read a very interesting paper before the Academy of Sciences in this city, a synopsis of which we shall publish in the next issue of the MINING AND SCIENTIFIC PRESS.

He is of the same opinion as the State geologist, as to the extent and the great value of the field. He has thoroughly explored it, and finds that the veins are thin and run parallel with each other, dipping towards the north at an inclination of twenty-three degrees. The coal is of most excellent quality, being highly bituminous and nearly free of ashes. Near the surface it is softer even than the best Hartley, but becomes harder as the excavations descend. Mr. Blake says that the formation is tertiary, the strata being of sandstone, clay and limestone; and he exhibited fossil remains of tertiary formation and marine shells that he had found in the mine, from which, and the fact that the particles of sand were very pure and rounded, he conjectures that the immense mass of wood and other vegetable matter deposited in the matrix of the coal, had accumulated at the base of Mount Diablo, and been kept there by an eddy when the whole of that portion of the country was submerged by water.

Whatever may be the theories indulged in by men of science as to its formation, we care little, so long as they all agree that the coal is of first-rate quality, of great extent and easily worked, for that will insure us cheap coal, and what will not that accomplish? It will cause more steamers, more railroads, more mills and factories to be built; it will cheapen travel, the reduction of ores, and the making of fabrics and other useful articles; not to mention its effect upon the price of gas, and the cheap but comfortable glow that it will cast from the grates upon the family circles collected around the hearths of our happy California homes. When we think of all that he has done, and of all he yet may do, we feel half inclined to throw up our hat and hurrah for old King Coal.

THE SHASTA INDIANS DOOMED.—The Shasta Herald of May 11th says:

The party who started in pursuit of the Indians who committed the depredations we noticed in our last issue, overtook them on Mill Creek, in Tehama county, and succeeded in killing four of their number. Mr. Waggoner recovered his horse, but the rest of the stolen animals had been killed and eaten. A meeting of the citizens was held a day or two ago at Hazlebrigg's store, and measures taken to raise a fund to be disbursed in payment of Indian scalps, for which a bounty was offered. A committee were also appointed to confer with a meeting to be held during the week at Antelope Creek. The initiatory steps have been taken, and it is safe to assert that the extinction of the tribes who have been to settlers such a dread and loss, will be the result.

A New Field for Enterprise.

In the Washoe silver region, a new class of enterprise has of late been discovered, and is now engaged in to a very considerable extent. We allude to the formation of companies with large capital for the purpose of running long tunnels through the hills supposed to be rich with argentiferous and auriferous ores. These companies do not themselves own any discovered lodes, but the principle they work upon is that of undiscovered or blind lodes existing in the hills. These they claim and expect to discover, and in the meantime pay expenses, and perhaps even obtain a good profit from the companies in the hill who own discovered lodes, which are by these tunnels opened at a convenient depth. The first tunnel company of this description that was incorporated was the Mount Davidson, and it was speedily followed by a number of others. From correspondence of the *Alta* we glean the following interesting facts in relation to them:

The Mount Davidson Company's tunnel is now 500 feet long, and they have made a contract to cut it 2000 feet farther. In this distance they will cut through the Seueca, Watertown, Gould & Curry and Virginia lodes, all supposed to be rich. The Cedar Hill Tunnel Company intend to cut a tunnel, 1400 feet long, into the base of Cedar Hill, and they have already finished 300 feet of it. Their tunnel, when complete, will run through the Miller, Hirst and Meredith ledges. The Latrobe tunnel is on the eastern side of Virginia, and is to be 1500 feet long and to pass through the White & Murphy and Comstock claims. The workmen have already gone 600 feet into the hill, and a considerable body of water runs out of it. The Central Tunnel Company, formerly called the "Central Mount Davidson Company," will pass through the Potosi, the Bachelor, the Golconda and the Chollar claims. In the Flowery District there are also some tunnel companies organized, including the Flowery, Pacific and Etna Companies.

That the enterprise of these companies will in most cases be abundantly rewarded, we feel sure, but whether in *all*, is a matter of doubt. There is no question but a tunnel run through or along a ridge known from the outcroppings to abound with silver ore, will pay; and the amount paid by outside companies for the prospecting and opening of their claims will be a pretty sure safeguard against loss, although in all cases, we think the tunneling companies should agree beforehand with those owning claims, as to the amount to be paid for the service done.

It seems to us too that a similar plan of operation might with profit be carried on in the districts where gold most abounds. We remember that some few years ago, a number of persons in Grass Valley and Rough-and-Ready, associated together for the purpose of prospecting for gold-bearing quartz, and, if our memory be correct, with highly satisfactory results. But by the Washoe system the companies not only prospect for themselves, but if even unsuccessful are secure against loss, and also open up the mines of others, so that the whole country is enriched by their labors. Like great canals which render one hundred fold more valuable the land on either side, these tunnels make available the wealth enshrined in the hearts of the argentiferous mountains and bear it forth to the outer world.

A Rich Strike at Washoe.

We learn from Mr. Rosenfield, of Hutchings & Rosenfield that the ore of the Chenango Company, at Silver City, is turning out splendidly. This company only commenced operations a few months ago, and from the vein near the surface extracted \$84 of gold to the ton. As they work downwards, the richer the rock becomes. On the 10th inst., E. Rutling & Co., of that city, obtained five hundred and nineteen dollars eighty-four cents from a ton of this rock. Four hundred and ninety-six dollars seventy-nine cents of which was gold, and twenty-three dollars five cents silver. Their certificate of assay, which we have seen, states the fineness of the gold to be 566, and of the silver 420—the former being worth eleven dollars seventy cents per ounce, and the latter fifty-four and a half cents per ounce. The first yield from the outcroppings gave a larger proportion of gold to the silver, than the last assay indicates—showing that although the vein becomes much richer as it goes down, yet the proportions of gold to silver in it vary in favor of the latter. From this circumstance it is presumed that at a great depth the silver yield will predominate, and ultimately the gold become a silver vein. This is the largest amount of gold ever taken from one ton of rock in Washoe, and the consequence is that the stock in this company's claims has run up to a high figure—one hundred and twenty-five dollars a foot having been paid a few days since, whereas but a week ago the whole of it could have been bought at ten dollars a foot! The ore of this company is ground at Ogden & Wilson's Reduction Works, and Tyler's process of amalgamation was used.

The Copper Mines of California.

RICH copper mines have long been discovered in California, but until very recently the impression has prevailed that however rich they may be, the high prices of labor, etc., would not admit of their being worked with profit. This was doubtless occasioned by the fact that the Arizona copper mine, about one hundred miles in a southeasterly direction from Fort Yuma, which is said to be very rich, proved unprofitable, and the works were stopped—and that the other mines of Arizona, from which that metal is extracted, would not pay, were the ore not also argentiferous; the silver being the main reliance of the miners. But from what has lately transpired, we lay the blame of the Arizona mine's failure to mismanagement or some such cause—always supposing that the copper ore was as rich as was stated.

But a few days since a letter was received from Crescent City, and published in one of our journals, dated May 8th, in which we learn the following interesting items concerning the Crescent City copper mines:

"It has by some been supposed that the long quiet which succeeded the excitement of last year on the subject, was an indication that the whole matter was one of the numerous exploded humbugs of our day and our country—in the expressive California *patois*, that copper here had 'gone in.' Such an idea is a great mistake. The fact is that one of the mining companies, the *Alta*, having sent forty-two tons of their ore East, last fall, all the other companies came with them to the conclusion to await the returns from that shipment before spending any more money. Those returns have just been received and show a most gratifying result, one which will immediately give a great impulse to the copper business in this locality. The forty-two tons of ore yielded near \$7000, and the net proceeds to the company are over \$6000. I am informed that the company are already remunerated for their whole outlay in opening the mine, and have nearly \$1000 in hand for future operations, besides having given the San Francisco House that was shrewd enough to make advances on the shipment, a profit of between \$1500 and \$2000 on the operation. This is an inkling of what we may expect to see when the copper mines in this country shall have been fully developed. I believe there is enough of the article here, and easily accessible, to supply the world for the next one thousand years, if not for 10,000. The immense importance of this matter to our whole country can hardly be overestimated. The forty-two tons of ore above mentioned averaged forty-five and a half per cent. of pure copper. One considerable lot separated from the rest yielded fifty-seven per cent.; none of it went below forty-three per cent."

Previous to the gold discoveries of 1851, Australia had already made its mark in the world as a great copper and wool producing country. Millions of tons of the ore were shipped to England as ballast, on ships loaded with wool and hides, (for which it is admirably adapted), in the shape of regulus, which name the ore bears after having gone through the furnaces, and being in a measure reduced. The copper mines of Fort Phillip are still famous, and worked to great advantage. We think then, whether accounts from the Crescent City copper mines be strictly true in every particular or not—and we have no reason to believe such statements false—that those, and many other mines of copper ore in California, can be opened out and worked with great advantage to capitalists, the poorer classes, and the whole State. In fact we go still further, and assert that the mines of tin, antimony, etc., known to exist in large quantities in California, can even now be worked with remunerative results, provided the appliances of most modern invention be brought into play. Here too would be the best method of ridding the gold mines of the Chinese, which is so universally desired by our white population. Let our copper and tin and iron mines be opened and worked by Chinamen. Then they will form an element contributing to, instead of retarding, the growth and prosperity of our State.

THE new musical publication by Messrs. Gray & Herwig, Clay street, entitled "Bridal Veil Schottische," by Geo. T. Evans, has been laid upon our table. It reflects credit upon both composer and publishers. The schottische though simple presents some original ideas, and will no doubt become a favorite with our musical friends in this State.

"THE MINER'S GUIDE" is now in press and will be sent to subscribers and book-dealers throughout this coast.

California Academy of Sciences.

MONDAY EVENING, May 13.
Phoenix Building, Clay street.

Mr. Nevins in the chair. Present—Drs. Trask (Sec.), Kellogg, Ayres and Beltr; Messrs. Boynton, Benrdsley, Stivers, Silversmith (Ed. Press); Prof. Blake, and, by invitation, P. G. Feltz (sloop *Wyoming*). Dr. Ayres presented communications from the Smithsonian Institute, also a bill from Mr. Felix Fluogel for books forwarded to the Academy. This is to be defrayed by subscription of \$5 50. Dr. Kellogg read papers on the *collinsia hirsuta*, also on a new species of *allium*. Dr. J. W. Van Zandt and Samuel Tyler were proposed for resident members. Dr. Ayres presented a plaster casting of an extraordinary large shark's tooth, now in the possession of Mr. Duprat, which was brought from the Cocos Islands. The same gentleman has also a collection of fishes, containing some nine or ten new species, of which two are new genera, and were collected by Capt. Scammon. Dr. Ayres will describe these successively at the next meeting. Prof. Blake gave an interesting scientific synopsis of the coal regions of Monte Diablo, accompanied with a diagram showing the different strata of clay, rock, sandstone, and veins of coal. He describes the coal to be highly bituminous. The veins are not very thick. The fossil remains he classes among those of a tertiary nature; he has also discovered marine shells. He is of the opinion that the deposit of coal was occasioned by currents and eddies depositing vegetable matter, judging from the whiteness and rotundity of the grains of sand.

Mr. Beardsley stated that new cinnabar mines were just discovered in Napa county, in the vicinity of a new road leading through that district, said to be very rich. His informant is Mr. Montgomery, our cotemporary of the Napa Reporter.

Deutscher Naturwissenschaftlicher Verein.

(GERMAN SCIENTIFIC CLUB).

WEDNESDAY EVENING, May 15th.

Society's Hall, Clay street, over the Merchants' Exchange. }
Dn. Eckel in the chair. Present—Messrs. Neubaus (Sec.), Schmidt, Riehn, Jordan, Erbe, Heller, Silversmith (Ed. Press), Hagedorn, Ruthenberg, Kruse, Behrens, George, Rausch and visitors.

Mr. I. C. Milde of Luebeck was unanimously declared a corresponding member of this association.

Dr. Eckel informed the members that for the time being the present quarters could be retained, whereupon the association decided to remain.

The resolution changing the day of meeting from Wednesday to Thursday was read a second time and passed.

Mr. Erbe continued his interesting discourse on graphite, carbon and oxygen, dwelling at length upon the formation of the diamond and other carbonaceous substances. An intense desire and interest is manifest in this association, as to developing the resources of our land. The discourses so far delivered are practical, interesting and instructive.

Discovery of a New Quicksilver Mine.

A short time ago says the *Herald* of May 15th, Mr. B. C. Wattels discovered a quicksilver vein of surpassing richness, in Sonoma county, on the verge of Napa county, and made his discovery known to certain parties in this city. A company was formed, the mine divided into twenty shares, capable engineers employed to examine it, and other measures adopted to work the discovery, which was termed the "Pioneer Quicksilver Mine."

The principal proprietors are Messrs. Alfred Fonda, John Gray, T. A. White, John Van Bergen, A. P. Hotaling, Oscar Shafter, R. C. Wattels, the discoverer, and several others.

Yesterday we were presented several samples of the rock, which is saturated with pure quicksilver. The company have taken out one hundred and fifty tons of this rock, and after drifting eighty feet have increased the vein to the width of fifteen feet, and the engineer gives it as his opinion, that the vein is from fifty to sixty feet wide. Much of the rock is cinnabar, while the remainder is thoroughly saturated with the virgin metal. This is but another proof of the illimitable resources of California.

A GENUINE GOLDEN BUTTERFLY!—The *Columbia Times* of last week says:

J. Massey, Esq. showed us yesterday a living chrysalis of some (to us) altogether unknown variety of butterfly, on which there is a ring and several spots of gold. This is no deception or hoax, strange as it may seem; but the insect is marked, as stated, with actual, positive metallic-looking gold.

Euler's Powers of Calculation.

LEONARD EULER, one of the most distinguished mathematicians of the eighteenth century, was born at Basle in 1707, and was educated in the University of that city. In 1730, he obtained the Professorship of Natural Philosophy in the Academy of St. Petersburg. In 1735, a very intricate problem in mathematics having been propounded by the Academy, he completed the solution of it in three days; but the exertion of his mind had been so violent that it threw him into a fever, which endangered his life, and deprived him of the use of one of his eyes. In 1741, by invitation of Frederick the Great, Euler went to Berlin, where the Princess of Anhalt, the King's niece, received from him instructions in the well-known facts in the physical sciences; and on his return to St. Petersburg, in 1755, Euler published his celebrated work, *Letters to a German Princess*, in which he discusses with clearness the most important truths in mechanics, optics, sound and physical astronomy. This work has been translated into most of the languages of Europe. Euler had previously published several isolated treatises and some hundred memoirs on mathematics. During his residence at Berlin the king often employed him in calculations relative to the Mint and other subjects of finance; in the conducting of the waters of San Souci, and in the inspection of canals and other public works. By invitation from the Empress Catharine, Euler returned to St. Petersburg to end his days. Shortly afterwards he lost the sight of his other eye, having been for a considerable time obliged to perform his calculations with large characters traced with chalk upon a slate. His pupils and his children copied his calculations, and wrote all his memoirs from his dictation. To one of his servants, who was quite ignorant of mathematical knowledge, he dictated his *Elements of Algebra*, a work of great merit, and translated into English and many other languages.

Euler now acquired the rare faculty of carrying on in his mind the most complicated analytical and chemical calculations; and his powers of memory wonderfully increased, even in his old age. M. d'Alembert, when he saw him at Berlin, was astonished at some examples of Euler's calculating powers which occurred during their conversation. To instruct his grand-children in the extraction of roots, Euler formed a table of the first six powers of all numbers from 1 to 100, and he recited them with the utmost accuracy. Two of his pupils having computed to the seventeenth term a complicated converging series, their results differed one unit in the fiftieth chapter, and an appeal being made to Euler, he went over the calculation in his mind, and his decision was found correct. His principal amusement, after he had lost his sight, was to make artificial loadstones, and to give lessons in mathematics to one of his grand-children, who evinced a taste for science.

In 1771, a dreadful fire broke out at St. Petersburg, and reached the house of Euler; when Peter Grimm, a native of Basle, having learned the danger in which his illustrious countryman was placed, rushed through the flames to Euler's apartment, and brought him away on his shoulders. His library and his furniture were consumed, but his manuscripts were saved by the exertions of Count Orloff.

Euler underwent the operation of couching, which happily restored his sight; but either from the negligence of his surgeon, or from his being too eager to avail himself of his new organs, he again lost it, and suffered much severe pain from the relapse. His love of science, however, continued unabated. On September 7th, 1783, after having amused himself with calculating upon a slate the law of the ascensional motion of balloons, which at that time occupied the attention of philosophers, he dined with his relation, M. L'excel, and spoke of the planet Herschel (then recently discovered) and of the calculations by which its orbit was determined. A short time afterward, as he was playing with one of his grandchildren, his pipe fell from his hand; he was struck with apoplexy, and expired, in the seventy-ninth year of his age.

Euler's knowledge was not limited to mathematics and the physical sciences. He had carefully studied anatomy and botany, and he was deeply versed in ancient literature. He could repeat the *Æneid* of Virgil from the beginning to the end, and he could even tell the first and last lines in every page of the edition which he used. In one of his works there is a learned memoir on a question in mechanics, of which, as he himself informs us, a verse of the *Æneid* gave him the first idea. He amused himself with questions of pure curiosity, such as the knight's move in chess so as to cover all the squares. His researches have gone far toward the geometry of situation, a subject still imperfectly known. The following is one of the questions which Euler has generalized: "At Kongsburg, in Prussia, the river divides into two branches, with an island in the middle, connected by seven bridges with the adjoining shores: it was proposed to determine how a man should travel so as to pass over each bridge, and once only."

A PLAGUE.—From a Honey Lake Valley correspondent; we learn that in that valley, millions of grasshoppers have already made their appearance, and some of the farmers fear that they will ruin their crops; being too young to fly, they eat everything smooth to the ground in their travels.

A LONG TUNNEL.—The *Placer Courier* says that there is a tunnel and shaft at Independence Slope, near Forest Hill, which is nine hundred feet long, and has now reached a rich vein of black cement, besprinkled with gold.

New Silver Districts.

It seems that this year is destined to be as fruitful in mineral discoveries as the last. The Esmeralda and Coso silver districts were then discovered, but as yet little is known of either. The last correspondence we have seen from Aurora, in the former, states that "mining work is steadily progressing. The Esmeralda tunnel is nearly in, and the First North and South Extensions are being pushed ahead day and night. Fine ore is being taken out by the Antelope, St. Louis and other companies, and all are waiting chances for shipment. Notwithstanding Carson and Virginia accounts, we will yet prove ours to be the richest district east of the Sierra Nevada." This is very encouraging. From the Coso district we hear very little indeed, except from the merest report; but it will doubtless prove rich as the neighboring argentiferous districts. Both Esmeralda and Coso Districts will be pretty well tested during the coming summer, and their silver and gold wealth developed. On Rattlesnake Creek, near Grass Valley, Nevada county, we believe silver mining is still being carried on by Messrs. Jenkins and Atwill, but with what results, we are unable to state. What is supposed, too, to be a rich and extensive argentiferous region, has within a few days past been discovered at Honey Lake Valley. The *Territorial Enterprise* informs us that "a company have been engaged since November last, prospecting what is supposed to be a silver lead, lying southwest of the lower portion of the valley. They think they have a rich lead, as the general topography of the country is similar to that around Virginia City. In fact, the people of that section are sanguine that their valley is near the main lead." A correspondent of the *Marysville Appeal*, writing from Susanville, Honey Lake Valley, on the 1st of May, gives us something more definite, thus: "There is an unusual excitement here at this present time, concerning the discovery of rich silver lodes near Lassen's Meadows, on the Humboldt. Nearly one-half of the population of this valley have gone to Humboldt on a prospecting tour. Those who returned for fresh supplies within the last few days report the prospect as very flattering indeed. I heard it reported that a quartz mill is already on the road from Washoe to the new placers, which are said to prospect from \$700 to \$2000 to the ton. The distance from Marysville, by way of Dogtown and this place, is 250 miles." We hope sincerely that these reports are true. Fortunate, indeed, is it for California, as the gold yield slowly decreases, the yield of silver on this coast has assumed such importance. Possessing gold, our State has made for herself a great name and position in the world; but possessing both of the precious metals in such remarkable abundance, what may she not yet become?

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved
A MALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz.

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being self-feeding and self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHOE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Considerable activity in mining sales during the last ten days up at Virginia City!

Potosi, \$200 per share.
Central, \$700 per share.
Ophir, \$1100 per share.
Gould & Curry, \$300 per share.
Chollar, \$8 per share.
Lucerne, \$25 per foot.
St. Louis, \$6 per foot.
Mount Davidson, \$30 per share.
Mark Anthony, \$8 per foot.
Louise, \$16 per foot.
Bradley, \$8 per foot.
Sacramento, \$6.
Shelton Co., \$5 per foot.
Josephine, Flowery, \$8.
West Branch, Flowery, \$8.
Harrison, Flowery, \$12.
Yellow Jacket, \$40.
Exchange, East Comstock, \$25.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$18.
Hard-Up, \$5.
Chimney rock, \$12.
Dergen, \$10.
Rich Co., \$3.
Miller, \$6.
Costa Rica, \$5.
Spanish Co. Plymouth Ledge, \$8.
Chelsea, \$6.
King Charles, at Howery, \$6.
Great Western Ledge, Helena, \$10.

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.

[Having completed all the requisite arrangements, we shall in future be able to lay before our readers a reliable list of prices of mining stocks of Utah.]

Cameos, and how they are Cut.

Rome is now the chief city of the art of cameo cutting, two kinds of which are produced; those cut in hard stone, and those cut in shell. The stones most valuable for this purpose are the oriental onyx and the sardonyx, provided they have at least two different colors in parallel layers. The value of the stone is greatly increased for this purpose, if it has four or five different colored parallel layers, if the layers are so thin as to assist in making the device of the cameo. For example, a specimen of stone which has four parallel layers may be used for a cameo of Minerva, where the ground would dark gray, the face light, the bust and helmet black, and the crest over the helmet brown or gray. All such cameos are wrought by a lapidary's lathe, with pointed instruments of steel, and by means of diamond dust. Shell cameos are cut from large shells found on the African and Brazilian coasts, and generally show two layers, one white, and the other either pale coffee color or deep reddish orange. The subject is cut with small steel chisels out of the white portion of the shell. Shells adapted for cameo cutting are dense, thick, and consist usually of three layers of differently colored shell material. In one variety of these shells each layer is composed of very many thin plates, that is laminated, the laminae being perpendicular to the plane of the main layer, and each lamina consisting of a series of elongated prismatic cells, adherent to their long sides. The laminae of the inner and outer layers are parallel to the lines of growth, while those of the middle layers are at right angles to them. In another variety, known as the cowries, there is an additional layer, which is a duplicate of the nacreous layer, formed when the animal has attained its full growth.

Great Improvement in Making Sugar.

L'Opinion Nationale of Paris, under the heading, "A Revolution in the Manufacture of Sugar," announces a discovery by M. Rousseau, which, it says, will more than double the yield from a given quantity of cane. The process is exceedingly simple, and the editor says that he has repeated it with complete success in the laboratory, and sees no reason why it should not succeed as well on a large scale. It is known that saccharine juice, as obtained from plants, alters rapidly in the air, because it contains albuminous matters which become brown or black by the action of oxygen. M. Rousseau removes the albuminous matters by heating the juice with about three one thousands of its weight of caude pulverized plaster. As soon as the liquid arrives at boiling heat, a thick scum forms on the surface, and by decantation, a perfectly clear liquid is obtained. This liquid left in the air would become as black as ink; but by mixing with it six to eight per cent. of its weight of hydrated peroxy of

iron, all the alterable organic matters are removed in a few seconds. It will then remain for an indefinite time without color, and it is only necessary to boil it down to obtain crystallized sugar.

TEETH! TEETH! Extracting without Pain! Dr. W. H. Irwin, Dentist, Third street, near Howard (opposite Estlin's Mansion) All branches of dentistry performed in the neatest manner.

Extracting, each, \$1.
Extracting children's teeth, 50 cents.
Filling with gold, each, \$1, \$2 and \$3.
Filling with platinum cement, \$1, \$2 and \$3.
Cleaning, whitening and burnishing, \$2, \$3 and \$5.
Straightening, etc., from \$2 to \$5.
Nerves killed and toothache cured, \$1.
Whole or partial sets nicely and firmly adjusted on the finest gold, nt from (each tooth) \$5 to \$10.
On the best silver plate (each tooth) \$3 to \$6.

Montgomery street Omnibuses pass the office every five minutes. Special attention paid to Children's Teeth. Circulars, giving full directions to parents for the preservation of Children's Teeth. Remember the place—Third street, near Howard.

Corner Front and Taylor Streets, Portland, Oregon.

Having had three years' experience in the Fruit Trade in this market, and a thorough knowledge of the business, they feel confident in their ability to give satisfaction to all who favor them with business. Fruit-growers who consign to us, will be kept well posted in the changes of the market, and in all that pertains to their interest.
A liberal share of patronage is respectfully solicited. ja4

TO OUR FRIENDS AND THE PUBLIC AT LARGE.

J. C. MEUSSDORFFER, HAVING RETURNED FROM HIS BUSINESS VISIT TO PARIS, desires to invite the whole hat-wearing community to favor him with a visit, and inspect the largest and most beautiful assortment of

Gents', Ladies, Misses, Youths' and Infants' Hats and Caps,

Ever exhibited west of the Atlantic. They were selected by Mr. Meussdorffer himself, who has eleven years experience in this State, and who feels confident that all, even the most fastidious, can be suited.

Our Department for Ladies and Misses contains, among others, the following new styles:

EXPRESS EUGENIE, ANDALOUX MARRON, IRLANDISE MONLOW, BOLEERO MONLOW, BOLERO MARRON, TUNOR NOIR, FRANCOIS FANTAISIE.

Our extensive arrangements in Paris and New York enable us to sell any kind of Hats at least fifteen per cent cheaper than any of our competitors.

Mr. M., having had some very superior MOLESKIN PLUSHES manufactured expressly for him at Lyons, is prepared to produce a finer MOLE HAT than was ever before manufactured. Our prices are:

No. 1	Extra Super Moleskin Hats, made to order,	\$8
No. 1	" " " " " "	6
No. 1	" " Silk " " " "	5
	Imported " " " " " "	4

Meussdorffer's stock of SOFT HATS, CAPS and STRAW HATS, is the largest in the State, and receives additions of the newest styles by every steamer from Paris and New York.

Every one and all,
Please give us a call,

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our before extensive establishment, we can confidently announce to the public that we now have

The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp Shoes and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Muley, and Crenier Saw Mills; Shingle Machines, cutting 26,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city. Know's Amalgamators, with the latest improvements; Howland & Hanscom's Amalgamator; Goldard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Towers; Steam Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lam's Patent; and to make a long story short, we make castings and machinery of every description whatever, with the latest improvements; and Brass Castings.

Steamboat work promptly attended to.

Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight

of Stamps, Twenty-Five per cent. more rock

than any other mill yet invented. It is also

Cheaper, more Durable and run with Less

Power. All parts of it being fitted together

before leaving the shop, it can be put up and

set at work Crushing the Ore, in Ten Hours af-

ter arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before?" It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe.
Barbota Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco.
Ogden & Wilson, }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for simplicity, durability, convenience and thoroughness of work. The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter-bar being hinged to the machine, can be packed up without removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchasing.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Mun & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM ION, CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as a gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

The Secret Gold Mine of the Desert.

From time to time we have very interesting reports of the operations, the journeyings, prospectings, dangers and trials of those venturesome spirits who go out over the burning deserts, and penetrate the fastnesses of the mountains in search of gold. Companies go out sometimes prepared for a six months' journey. To such men we are indebted for the great discoveries which have been made on the Colorado desert, and the mountains rising up from it.

We have this week heard some particulars from a party of three miners who had penetrated the Kuiseit mountains, about 150 miles from the Vegas, into the country of the Co-itch Indians. They were in search of the much talked of, and oft sought for "Goller mine." They found themselves among a numerous and warlike tribe of Indians, who mustered fully 200 warriors, drawn up in battle array, and who declared that no white man had ever passed through their country, and never should. The Americans held a consultation, and concluded, as there were but three of them to contend with 200 Indians—large, powerful men—they had better take the hint and return; not, however, without informing their opponents that they would return again and force their way. During their stay in this country they obtained information that they were within "three sleeps" of a ledge of rock where the gold could be picked off with a knife. This is supposed to be the "Goller lead." These Indians are very numerous and a warlike tribe. They are located in these mountains, in Utah Territory, from which they seldom emerge. The neighboring tribe is the Pah-Utes, who have a salutary dread of their powerful neighbors, and take especial good care not to be found prowling within their recognized limits. The vagabond Utes are afraid of them; and when one of the latter visits a Ute lodge, he is received with more than ordinary courtesy.

The Co-itch Indians have no villages, no agriculture, no clothing but the skins of small animals. Deer are not found in their country, and they seem to have a very hard time of it to procure the means of living.—*Los Ang. Star, May 11.*

A New Amalgamator.

It is well understood that one of the most serious obstacles to the successful working of our gold mines has been owing to the great loss of the gold after it has been extracted from the rock. This is easily accounted for, as a very large per centage of gold, when liberated from the original matrix, is not in a condition to unite with the mercury, but is coated with a sulphide or silicate that renders its amalgamation impossible until chemically or mechanically cleaned. The former has often been attempted, and abandoned as being too expensive and complicated. To clean the ore mechanically has proved nearly as unsuccessful, owing to the imperfectness of the machines heretofore devised for that purpose. The ore and mercury being ground together, the mercury becomes oxidized, so that it floats like grease on the surface of the water, and will not unite with the gold. With these conditions, we cannot marvel at the great loss of mercury and gold, in the working of nearly all our mills, and only wonder that they have succeeded so well. By reference to our advertising columns, it will be seen that Dr. Beers, who, we learn, is a practical quartz miner, has invented an amalgamator which will obviate all of the difficulties, doing the work in the most perfect manner, requiring the least possible attention. The principle claimed, we believe, by the inventor, is for the perforated or false bottom, upon which the rock is ground, under which lies the mercury; and for a receiving hopper, connected with the miller, having a distributing canal leading underneath each miller, conveying all the light float gold as well as all the rest through this channel, where it is ground in immediate contact with a large surface of mercury, which is not ground. If this invention accomplishes all that is claimed for it, quartz miners will find their receipts of gold greatly increased by the use of Dr. Beers' new amalgamator.—*Ex.*

[For full description of this useful invention, see first page.]

California Capital in Washoe.

Says the *Sierra Democrat* in its last issue: "We believe in Washoe. Washoe is good. It is one of the very few births of California venture that are destined to be ultimately substantial. As it is developing under California enterprise, good economy would have sustained the prospecting muscle with assessments upon California industry. Of all the modes adopted by men of small means, for developing the silver leads of Washoe, none other has been so evenly successful as that of organizing companies in this State, and keeping up the work by assessments levied here.

The men of small capital who have gone over to Washoe, depending entirely on their good fortune there, are hard pushed for money. They are glad to borrow money at extravagant rates of interest, and many of them are now compelled to forfeit claims which they have great confidence in, or to give up the lion's share to the 'bug-eaters,' to obtain the wherewithal to live. Now there is a proposition to suspend operations for two months, to allow shareholders to recuperate, to suspend all regulations requiring work to keep the titles good."

CALIFORNIA PATENTS.—Messrs. Withered & Tiffany have just procured a patent from the Home Government for a Grain Separator, invented by Andrew Hunter, of Solano Co., California.

STRIKES.—We have heard during the past week of a number of new "rich strikes on this Divide. One is on El Dorado Cañon, where a company have been engaged for the last four years in running a tunnel, and the report is that they struck rich pay dirt a few days ago.

WOOD'S CALIFORNIA DIGEST.

TESTIMONIALS.

FROM THE PRESS, BENCH AND BAR.

[From the Sacramento Union, October 27, 1857.]

The Digest is more complete in its arrangements, and more perfect in its Indexes, References and Appendix, than any we have hitherto examined. It contains a great variety of interesting matter, very clearly arranged; will prove a great convenience to the profession, and put into the hands of the people the laws of the State, compiled in so perfect and simple a manner as to enable any man to find any law in a few moments, which he may wish to examine. Mr. Wood has further exhibited the good taste and State pride to have his Digest printed in California.

WOOD'S TEST.—A copy of this much-needed work has been laid before us. We congratulate the Bench and Bar, indeed, the public generally, upon the manner in which this work has been gotten up. The arrangement is systematic and excellent. It has a copious Index, and the reader will experience no difficulty in finding any portion of the contents to which he may desire to refer. Great labor is saved by a ready access to the Laws and Decisions. It will prove an invaluable aid to the judge and lawyer—indeed, it will be of valuable assistance to all public officers, State and Federal, and to business men generally. Such an enterprise deserves to be rewarded, and we trust that the industrious and excellent compiler will find his labors amply compensated and generously appreciated by our people.

[From Hon. M. Hall McAllister, February 5, 1861.]

It has been but a brief time in my hands, but I am prompted by the examination time has allowed me to give it, to say, it is a work demanded by the wants of the State, and will not only prove acceptable to the profession, but be a valuable work to the mercantile and other classes of our people.

COUGHS, COLDS, CONSUMPTION,

NEWELL'S
PULMONARY
SYRUP.

WHOOPIING COUGH, BRONCHITIS,
ASTHMA, SORE THROAT,
ETC., ETC.,

Are complaints peculiar to no place, climate, class or condition of men. They are the common, every-day complaints all over the world. Would you be free from them and their fatal consequences? Try NEWELL'S PULMONARY SYRUP. No article of the kind ever offered to the public has met with such universal approbation.

Keep a bottle of it in your house, and when you feel that you have taken a slight cold, use it at once. Delays are proverbially dangerous, even in business affairs, and when exercised in relation to health, produce the most unfavorable results. No wise man would delay for a single moment in extinguishing the spark that threatened to consume his house or his goods. Is the body and its condition less valuable than goods and chattels?

Try the Pulmonary Syrup, and I am sure of your most favorable testimony to add to that of all those who have already done so. Sold by the Druggists generally. Manufactured and for sale by WM. NEWELL,
ap19 70 Merchant street San Francisco.

HUCKS & LAMBERT'S CELEBRATED PATENT H & L AXLE GREASE.
A CARD.—The subscribers have the pleasure of announcing to their numerous patrons and friends, that they have been honored by the Committee of the Mechanics' Institute with a
for their Curved AXLE GREASE. Also, that the S. F. Bay Agricultural Society have awarded them their FIRST-CLASS PRIZE for the same.

But however gratifying to the advertisers to have their HOME MANUFACTURE thus distinguished, it is with greater pride that they state the fact that (notwithstanding the overwhelming importation of an article from the East, assuming their title) the demand for their new popular H & L AXLE GREASE has more than doubled during the present season, and whilst the manufacturers offer their grateful thanks to all those who aid to "California Produce" who have given them so large an encouragement, they beg to say that no pains will be spared in future to sustain the WIDE-SPREAD REPUTATION their material has acquired, of being the
Best and Cheapest Lubricating Medium
FOR WHEEL-CARRIAGES, etc., ever introduced into California!

HUCKS & LAMBERT,

Prospectus

OF THE

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR!

VOLUME III.—NEW SERIES!

A new number of this extensively circulated paper commenced March 30 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly or its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader, and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers!

This journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.
Ten Copies for Six Months, \$16.
Ten Copies for Twelve Months, \$30.
Fifteen Copies for Twelve Months, \$44.
Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

Rooms 20 and 21, Government House, Corner of Washington and Sansone streets, San Francisco.

ANOTHER PREMIUM AWARDED TO THOMAS DONNOLLY, AT the Alameda County Fair, held in June, 1860, for the best-manufactured CALIFORNIA YEAST POWDERS.

Read the report of the Committee, which is a sufficient guarantee for the superior quality of T. Donnelly's California Manufactured Yeast Powders, and which are now admitted to be superior to any now in use in California or elsewhere. The following is the report of the Committee:

"We would notice as worthy of patronage the very superior Yeast Powders on exhibition by T. Donnelly, having tested them, and found them much better than any other." Mrs. J. B. Welser, Mrs. C. M. Wentworth, Mrs. S. E. Allen, Mrs. F. K. Shattuck, Mrs. Dr. Newcomb.

The above citation is a satisfactory guarantee of the superior quality of T. Donnelly's Genuine California Premium Yeast Powders.

People of California! encourage home manufacture, and in the one article of Yeast Powders, you will benefit the State several thousand dollars a year that are taken away for an imported article that cannot compete with your own manufacture.

Try Donnelly's Yeast powders, and you will find them superior to any. None genuine unless labelled on the top of every can, and dated 1860.

A JOURNAL OF SCIENCE, ART, MINING, AGRICULTURE, MANUFACTURES, CHEMISTRY, INVENTIONS, ETC.

VOL. III.

SAN FRANCISCO, SATURDAY, MAY 25, 1861.

NO 9.

The adjoining elegant engraving is an illustration of Wood's Improved Mower. 3000 of these machines were built and sold by him for the harvest of 1860. He received during the summer positive orders for 1000 more than he could supply. This is the best evidence that the heavy and complicated Mowers are being superseded by lighter, cheaper and more practical machines. Farmers have found it an unnecessary burden to drag a mowing machine weighing 700 pounds over their rolling land, and through heavy grass, and cannot fail to see, that to dispense with a dead weight of 200 pounds in a mowing machine is a great saving. In 1858, he first commenced the series of experiments by the prosecution of which the following results have been attained: 1st. The reduction in the weight of Mowers from 700 to 500 pounds. 2d. A reduction in draft consumed in mowing, of over one-half, the average draft of mowing machines heretofore used being from 300 to 400 pounds, while the draft of this is from 125 to 200 pounds, according to the crop cut. And, 3d. A reduction in price from 25 to 30 per cent. Besides the great reduction in weight, draft and price, the inventor has so combined strength with lightness, that the mowing machine

of his make is as durable as the heaviest machines of the older style; and this is not at all remarkable when we consider the fact that the material used in Wood's Mower costs from thirty to forty per cent more than that of any other machine of the kind. To show its great superiority to all other mowers, we need only state that Wood's Mower carried off the Grand Gold Medal of Honor, as the best Mowing Machine, either native or foreign; also the Gold Medal and 1000 francs, as the best foreign machine; and a Special Gold Medal at the Great French National Trial, at Vincennes, near Paris, June, 1860. The First Prize Silver Medal and 200 francs, at the trial at Trappes, near Paris, June, 1860. The Grand Gold Medal of Honor, as the most

WOOD'S IMPROVED MOWER AND REAPER.

number of First Premiums at various State and county Agricultural Fairs in the United States during the year 1860.

By a simple adjustment this remarkable machine can be used as a Reaper (see small engraving), to which the inventor has added a "Self-Raking Attachment," which saves the labor and weight of one man, and does much better than any man could do. The Self-Raker sweeps around the platform with the greatest ease and precision, being worked by an endless chain-belt. The size of the bundles of grain that it collects can be regulated by the driver. Wood's Combined Reaper and Mower, with Self-Raking Attachment, which is considered by all odds the best harvester in the world, can be bought at Treadwell & Co.'s large agricultural implement warehouse, on the northeast corner of California and Battery streets, where Russell's Patent Thresher and other improved machines may also be had.

THE WEATHER.—The temperature has been very variable during this week. Rain and sunshine have alternated, much to the gratification of the farmers near San Francisco. Previous to the recent rains, the farmers in the interior sadly complained of the dryness of the season, and expressed fears for their crops; but doubtless their minds are now easy. In Nevada, instead of rain, snow has fallen, injuring the peach trees to some extent.

ANJOURNED.—The State Legislature of 1861 adjourned this week, after consuming 133 days in session and \$152,950 per diem.

Mining in South America.

THE *Panama Star* of a recent date says:—"The news from the Valdivia gold regions is not of an encouraging nature, and little attention is likely to be turned that way. The reports from the coal mines are favorable; but the silver and copper districts are not working so advantageously.

A correspondent of the *S. F. Herald*, writing from Valparaiso, April 3d, says:—"The Valdivia gold excitement is a humbug, fostered and encouraged by interested property-holders of that section. I have no desire to falsify history, or deny the existence of gold in the streams of that province. I simply desire that my fellow-countrymen in California be convinced that it won't pay to get it out. This is an auriferous region; its geological formation, its resemblance in many striking points to California, and an experience of centuries, establish the fact; while half an hour's prospecting in almost any *estero* or water course in the country will give the color; but the plain, practical question, will it pay, has, so far, been invariably answered in the negative. Late accounts from Valdivia announce the complete cessation of mining operations on account of the heavy rains, which will prevent any extensive prospecting until the

close of the rainy season, say August next, and the enthusiasm of a few weeks ago has dwindled down almost to indifference.

A correspondent writing from Lima to Panama, said: "A company is being formed for the purpose of working the celebrated gold diggings of Curabaya. These diggings are undoubtedly extremely rich, but they are situated near the frontiers of Bolivia, very far from any place where resources can be obtained, and the miner has to undergo the greatest hardships to get there; he has to travel over terrible roads where no beast of burden can pass; he has to carry his tools and provisions on his back, and is constantly exposed to the attacks of savages. These mines have been worked several times with great success, but always for a short time only, as hunger, disease, and the arrows of the Indians, have invariably driven back the miners.

A VALUABLE RECIPE.—A little child of Mr. J. P. Murray, on Tule river, was dangerously poisoned last week, by swallowing a number of percussion caps. Dr. Thompson was sent for and succeeded in neutralizing the deadly effects of the phosphorus and copper, by administering repeated doses of the whites of eggs. The doctor informs us that this simple remedy if used in time is a good antidote against nearly the whole range of poisons which a child would be likely to get hold of. We have ourselves seen a valuable dog recovered from the effects of a dose of strychnia, simply by administering the whites of four eggs. Cut this out. —*Visalia Delta*, 10th inst.

useful farm implement, at the Gastrow, Mecklenburgh, Exhibition and Trial, June, 1860. The First Prize of £10 by the Yorkshire (England) Agricultural Society, August, 1860. Grand Gold Medal at the Greifswald Exhibition, Germany, July, 1860. First Premium Silver Medal, by the United States Agricultural Society, at Cincinnati, Ohio, and a large for per diem.

To Explorers, Discoverers, Prospectors, and Miners,
on the Pacific Coast.

Iron.

Geognostic Situation.—It occurs in primary and secondary rocks.

Extraction.—The ore is first broken into small pieces by the aid of the stamping-mill. After this it is roasted with a strong heat. It is then transferred to the blast-furnace, in which the operation of smelting is conducted. This is a large pyramidal stack, made of brick or hewn stone, from twenty to sixty feet high, having the inside cavity shaped like an egg, with its large end downwards, and lined with fire-brick or stone. Into this is placed alternate layers of charcoal or coke, and of the metallic matter; a quantity of lime is at the same time added as a flux. Before putting these in, however, the furnace must be first heated with coal only for twenty-four hours, and is then charged with the ore, etc., until it is quite full; a strong heat is then excited by bellows. As fast as the materials sink, by the melted metal being drawn out, the charge is renewed at the upper part. The slag rises to the surface and is drawn off by an opening while the metal collects at the bottom. The latter is drawn off at intervals, and cast into moulds, and is then known as pig iron or crude iron. To obtain it still purer, it is broken in pieces and kept in fusion in a puddling furnace, where it is raised to a very high temperature, and frequently stirred with an iron rod. At length the mass swells, emits a blue flame, and gradually becomes stiff and pasty. It is finally raised in a rude ball, and placed under the blows of a large tilt-hammer. It is cut up and piled or fagoted, and reheated several times, until it is made into tough and fibrous metal. It thus becomes the malleable iron of commerce, under the name of wrought, forged, or bar iron.

Assaying.—The ore should first be roasted with a strong red heat, as long as any smell arises. After this, two parts of the mineral are to be intimately mixed by trituration with one of fluor spar, one of charcoal, and four of salt, by weight. If the ore contains much stony matter, one part of black flux must be added to the mixture. The whole is then put into a covered crucible, and exposed to a white heat for an hour; after which a button of cast iron will be found at the bottom which determines the percentage.

The ores from which the iron of commerce is extracted are:

Brown Hematite.

Geognostic Situation.—Occurs abundantly in primary districts, and sometimes in secondary. It yields the finest kind of iron.

External Characters.—Color, brown, yellowish, or blackish brown; on the outside resembling black glazed earthenware. Occurs stalactical, tuberos, nodular, and amorphous. Structure, fibrous. Lustre, silky and resinous; yields to the knife. In a variety of this ore the structure is compact; lustre, none; streak, yellowish brown; fracture, conchoidal or earthy.

Red Hematite.

Geognostic Situation.—Chiefly in the primary, often in lead mines. It yields the best of iron for drawing and rolling.

External Characters.—Colors, blood-red and dark steel gray. Occurs massive, and in plates; also reniform, globular, and pulverulent. Fracture, uneven and earthy. Yields easily to the knife. Adheres easily to the tongue. Specific gravity 4.75.

Chemical Characters.—Infusible, but becomes magnetic.

Composition.—Oxide of iron 90; silice 2; lime 1; water three.

Specular Oxide of Iron. (Iron Glance.)

Geognostic Situation.—Occurs chiefly in primary mountains, associated with magnetic iron, red hematite, quartz, etc.; also in secondary rocks. Affords good malleable iron.

External Characters.—Color, steel gray, with a highly polished surface; often tarnished. Streak, cherry-red. Occurs crystallized in pyramidal dodecahedrons, hexahedral tables; also massive, disseminated, in concretions. Structure, lamellar. Lustre, brilliant; slightly attracted by the magnet. Specific gravity=5.52.

Chemical Characters.—Infusible. Insoluble in acids.

Distinctive Characters.—Yields a red powder when heated, and becomes magnetic.

Composition.—Iron 68; oxygen 31.

Magnetic Oxide of Iron. (Iron Sand.)

Geognostic Situation.—Occurs imbedded in trap rocks, and called mountain ore. Furnishes best bar iron, and yields from fifty to ninety per cent. of the metal.

External Characters.—Color, iron-black. Occurs in minute grains; also in octahedral crystals. Fracture, conchoidal. Strongly magnetic. Powder, black.

Chemical Characters.—Infusible by blowpipe.

Composition.—Oxide of iron 85.50; oxide of titanium 14; oxide of manganese 0.50.

Spathic Iron. (Clay Iron Ore.)

Geognostic Situation.—It occurs in veins in granite, gneiss mica-slate, clay slate, and graywacke, and in these it is associated with crs. of lead, cobalt, silver, but seldom with nickel and bismuth; more frequently with galena, copper ore, iron pyrites, and antimony ore. In other veins it is accompanied with brown, red, and black iron ore, calcareous spar, and quartz. But the most extensive formations of this ore are in

carboniferous limestone, in which it is arranged in thick beds. It is also found filling up amygdaloidal cavities in trap rocks. It is excellently suited for steel-making; the black variety affording the best.

External Characters.—Colors, yellow, white, brown and black. Occurs massive, disseminated, with pyramidal impressions; also in granular distinct concretions—nodular; and crystallized. Structure foliated or lamellar. Lustre, shining vitreous. Streak, white or yellowish brown. Yields to the knife; easily broken. Crystals, usually small, and found in groups. Specific gravity=about 4.

Chemical Characters.—Infusible, blackens, and becomes magnetic. Effervesces with muriatic acid. Heated with borax, it makes an olive-green glass.

Distinctive Characters.—From the earthy minerals it is distinguished by its weight. From other iron ores, by crystal line, foliated cleavage; and from blende, by its yielding magnetic iron.

Composition.—Oxide of iron 58; carbonic acid 35; oxide of manganese 4.25; magnesia 0.75; lime 0.5.

Tests for Iron.—Infusions of galls, when added to iron dissolved in an acid, gives a black precipitate, (black ink; prussiate of potash gives a blue precipitate (blue ink).

Lead.

The ore which is generally wrought, and from which nearly all the lead of commerce is procured, is the

Sulphuret of Lead. (Galena.)

Geognostic Situation.—Occurs in veins, beds, and imbedded masses, in primary and secondary mountains, but most frequently in the latter, and particularly in limestone. It is commonly associated with the ores of zinc, copper and iron, and often with those of silver. When it is found in the primary rocks, it is generally in granite. It is also found in alluvial deposits.

Extraction.—The ore is first hand-dressed, then ponded and washed, to free it as much as possible of stony matter. What remains must be removed to a reverberatory furnace, where it is speedily made red hot. In this state it is frequently stirred, and when it begins to become soft, the heat is reduced until the whole of the sulphur is expelled. The fire is then made brisk, by which the lead is melted, and collects at the bottom. A little lime must then be thrown in, to thicken the scoria, and the lead is drawn off into moulds; the heat is again applied to the scoria, by which more lead is procured.

When the native salts are found with the galena, they are selected, roasted, and afterwards fused in contact with the fuel, with an addition of lime.

When silver is found in the lead in sufficient quantity to be worked, the latter is heated in a furnace; a current of air being directed on its surface, when melted, by bellows. The silver is then freed from the small portion of lead left, by cupellation. Deducting the silver, the remainder is litharge.

Assaying.—Reduce a given weight of the ore to powder, place it on a muffle, and apply heat sufficient, so as on moving the muffle from the fire, the smell of arsenic and sulphur is no longer emitted. The roasting thus done, the ore is to be levigated—mixed with its own weight of black flux, and exposed in a crucible to a strong heat. The lead will be found at the bottom, which on being weighed and compared with the weight of the ore, will show the percentage.

In the roasting of lead ores, care must be taken not to fuse them.

External Characters.—Colors, bluish-gray, lead-gray, and on the outside, blackish-gray. Occurs amorphous, reticulated and crystallized in cubes and octahedrons. Structure, lamellar. Lustre, metallic. Perfectly sectile; soft. Very brittle. Opaque.

Chemical Characters.—When heated, first decrepitates, then emits the smell of sulphur, melting into a globule of lead.

Distinctive Characters.—Blende, molybdena, and graphite are infusible.

Composition.—Lead, sulphur, lime and silice.

Tests for Lead.—Glauber's salts, and an infusion of galls, give to a solution of this metal a white precipitate.

[To be continued.]

TERRIBLE EARTHQUAKE IN CHILE.—The Valparaiso correspondent of the *Panama Star and Herald* confirms the account of the total destruction of Mendoza by earthquake. Mendoza is located on the Eastern Slope of the Andes, and contained about twenty thousand inhabitants, of whom eight thousand are reported to have perished. Not a building was left standing, and in some instances whole families were swept out of existence. It was also stated in Valparaiso that the town of San Juan, distant about ninety miles from Mendoza, is also a mass of ruins. Both these places are on the eastern side of the Andes, within the boundaries of the Argentine republic, and not far from the volcano of Aconcagua. San Juan, or more properly, San Juan de la Frontera, contained 25,000 inhabitants.

GAS IN PLACE OF COAL.—A rather bold scheme has lately been originated in England. The project is no less than that of replacing the 9000 tons of coal now consumed daily in London by gas, which is to be made at the coal fields, and conveyed in an enormous main, three hundred miles, to the great metropolis. The practicability and advantages of using gas for cooking and other domestic purposes are now fully established.

Climatic Varieties.

Mr. Byrne, the observing editor of the *Sierra Messenger*, having recently visited Marysville, pens the following interesting notes of his journey to his home at La Porte:

On Friday morning last—Friday of last week—we left Marysville; left the gardens in that city full of roses and other beautiful spring and summer flowers; peach, apricot, apple, plum and fig trees were laden with green fruit; and fragrant windrows of hay stretched themselves out into long lines on the broad surface of many a valley. The plains, looking more beautiful than we had ever before seen them, were passed, and soon we found ourself lumbering in a coach up the foothills: the flowers looked less rugged, the foliage less verdant and luxurious than in the locality where we had been sojourning for a few days previous. At the Indiana ranch we found gardens blooming with the gifts of spring; but the floral offerings were more delicate looking, more sensitive, if you will, than members of the same circle living where Jack Frost is less frequent in his visits. At the New York House, pretty high in the mountains, plowing had been done, vegetables had shot up from the damp loam, the birds flew about the garden, in striking approval of what Nature was trying to accomplish; but the struggle between hateful Winter and vigorous Spring was so apparent that one almost felt like inquiring, "Can it be that Winter will tarry here—that his grasp reluctantly yields while hopeful humanity is eagerly expecting his departure?" At the Columbus House, the old thorough brace coach—a remembrancer of less progressive days than these—rests under the shadow of a suggestive sign; the horses are stabled, preparatory to a down trip; and mules, synonymous with mountain rides, come forth through the mud, under their heavy Spanish saddles, to convey the fatigued traveler mountainward. Recollections of Spring—the Spring of the Valley we mean—are now nearly forgotten, or remembered only as among things of the past—away out in a remote corner of this morning. The pine of the mountain, and his fellow-watchers with Winter—the spruce, the fir and the manzanita—look as grand and as vigorous as ever, but appear lonesome in their verdancy. A little farther on, as you gallop through mud, a patch of snow is seen; another snowy spot chills the vision, and as you progress the snow spots grow larger, huddle together, become a solid surface, and you are not a little surprised at finding yourself riding over five feet of dreary, chilly looking snow! At 6 o'clock p. m. you reach La Porte, and casting your eye down whence you started that morning, you behold the hill's south of you clad in a virginal garment thrown over them in the early November days. While the pleasant memories of time spent among flowers and fruits are vivid in your mind, while a stray thought goes back to the garden you were wandering in yesterday, breezes, cold with the touch of snow, come across the mountains to impress you with a reality very different from your imaginings; and more strange than all, you cannot forget the changes with which you met in one day's ride. There may be countries on this wonderful earth of ours presenting more varied climates than these of California, but it has never been our good fortune to find them.

Apprehended Renewal of Indian Hostilities.

It was thought that the celebrated Washoe war of last year had ensured a lasting peace with the Indians, the consequent development of the mineral wealth of that region, and a lasting prosperity; but from a letter written to the *Territorial Enterprise* from Great Salt Lake City, May 4th, we learn that the Indians are preparing for a renewal of hostilities against the whites.

"The Indians," says the writer, "have been reported preparing for a row on the westward route, and are said to be very poor. They are miserably so, and not at all unlikely to fight when they are caught stealing something to eat. Mr. Hawley, the station-keeper at Diamond Springs, over three hundred miles from this place, sent by last Pony to Major Egan the Superintendent, that things looked suspicious in that direction. He says: 'I think that the Indians are calculating to play a big game this summer. I am informed that old Nimiticka is very mad. There has been a number of strange Indians passing of late. They are coming from the north, south, east and west. They exhibit in their manner tokens of a deep laid scheme, and I shall not be surprised if they break out before long.'

Mr. Bolivar Roberts writes in a similar strain. It is time something was done. The Superintendent of Indian Affairs can do nothing, so he says, and we all believe him.

Jem Andrews, the mountaineer, came in last week from the Flathead country, and reports that the Indians north were directing their warlike steps towards Nevada, and purposed renewing last year's operations. Where Jem wintered all was quiet, but eighty miles north were warlike preparations."

Sacramento City to be Drained by Pumping.

Our people, says the *Sacramento Bee*, are exercised upon the matter of city drainage. The Supervisors have taken it in hand, and are not making that progress that they desire. The water fights them fiercely. It won't let them dig a trench to carry it off, so they have to conjure up some other method. We have seen the survey and plans of the City Surveyor, which show, that to reach the steam saw mill where the pump was to have been located, a ten feet deep ditch must be dug, and that, too, while the water is almost even with the surface.

Quicksilver Districts.

CALIFORNIA has some of the richest quicksilver mines in the world.

The main quicksilver district lies in Santa Clara county, about sixty miles northward from San Francisco, and twelve miles south-westward from San Jose, in the coast mountains. There are three mines here; the New Almaden, which derives its name from the quicksilver mine of Almaden, in Spain; the Enriqueta, so styled in honor of Enriqueta Laurencel, a little daughter of one of the proprietors of the mine at the time of the discovery; and the Guadalupe, a name suggested by the little river that drains the district.

These three mines are all found within a distance of four miles, in one range of hills, nearly in a straight line with each other. The only one from which mercury is obtained, is a sulphuret of cinnabar, a red heavy mineral, found, not in beds of regular width, but in large irregular masses, connected by small seams.

The mines of Santa Clara county are at the junction of metamorphic limestone rock on one side, and eruptive rocks, chiefly trap, on the other. It has been frequently observed, that, at such points of junction, metallic ores are more abundant and rich than elsewhere.

"The mountain mass," says W. P. Blake, "in which the (New Almaden) mine lies, is serpentine, with chloritic and talcose slates. Seams of limestone, intercalated in threads and masses of metamorphic limestone twelve feet thick, occur on the ascent before the serpentine is reached. The limestone is whitish, semi-crystalline, and without fossils. The trend is north west and south east, which is also the direction of the metalliferous veins. The dip is variable, but always to the east. Tale slate is the most abundant rock; but the serpentine and trap are associated with it in the mine. The gangue stone associated with the cinnabar is quartz forming geodic cavities. Sulphate of barytes occurs crystallized in some seams. The sulphuret of mercury is found in masses, towards which the vein lead."

The New Idria mine is in the coast mountains, about sixty miles south-eastward from San Jose.

Cinnabar is found on the sides of Mount St. Helena, in Napa county, and in the Geyser mountains, in Sonoma county.

Several companies have commenced to open the veins in those districts; but it is not known yet whether the deposits will prove to have any value. One of the Napa companies has sent fifty pounds of metal to the market.

A singular feature of the Napa and Sonoma cinnabar is, that the veins have much porous limestone rock, containing in its interstices, liquid quicksilver, which flies out in minute globules whenever the rock is shaken violently.

Quicksilver mining is very uncertain, and requires a large capital. The irregularity of the deposits renders it impossible to know whether the mine contains more ore, or at what cost it can be taken out. Expensive furnaces must be built before the metal can be taken from the ore. Many laborers must be employed in opening the mine, and preparing for subsequent work.

The New Almaden mine has produced 3,000 flasks, seventy-five pounds in a flask, in a month; but 2,500 flasks may be set down as its present monthly yield. The Enriqueta mine has produced 1,000 flasks; but the average is much less. During the last quarter of 1860, the yield was about 2,400 flasks. The New Idria mine furnishes from three hundred to five hundred flasks a month, and the Guadalupe mine from one hundred and fifty to two hundred and fifty.

The ore of the New Almaden and Enriqueta mine contains about eighteen per cent. of metal; that of New Idria, about eight per cent.

New Almaden is supposed to be—next to the Spanish Almaden—the most valuable quicksilver mine in the world, and perhaps it is even superior to that.

The mine is at an elevation of 1,000 feet above the sea, and two hundred feet below the top of the hill. Several hundred miners are employed, about half Cornishmen and half Mexicans, who are engaged in hunting the ore and taking it out. The deposits of ore have to be hunted; and the miners seek them by following up the little seams. Sometimes these masses are found fifty feet long, twenty feet wide, and twenty high. The ore is hoisted to the surface by machinery, and then is hauled down to the Hacienda or Reducing Works, where there are fourteen furnaces of brick. Each furnace may be fifty feet long, twelve feet high and twelve feet wide. In front is the fire-place; next that, is a chamber for the ore, about ten feet cubic, with open walls on each side, so that the heat may enter from the fire, and pass into the condensing chamber behind, in which there are partitions, so that the smoke from the fire and vapor from the ore must pass up and down, alternately, half a dozen times, and finally it rises out of a chimney forty feet high. The ore is placed in the ore-chamber, in large pieces, and with open spaces between, so that the flames and smoke from the fire may pass through it. The earthy matter near the large deposits of cinnabar contains a good deal of metal, and is made into brick, so that they can be piled up, also, with open spaces for the fire to pass through. In the bottom of the condensing chamber is water, by which the fumes of the quicksilver are cooled and condensed. The sulphur of the cinnabar, and the smoke of the fire, escape through the chimney.

In the Enriqueta and Guadalupe mines, the quicksilver is

collected in close iron retorts, which contain quicklime to absorb the sulphur.

The value of the New Almaden mine has been estimated very extravagantly, by the Attorney General of the United States, at \$25,000,000; its real value is not more than one fifth that sum.

The quicksilver is put into wrought iron flasks, made of heavy sheet iron, about a foot long and five inches in diameter, with an iron screw for a cork at one end. Each flask holds seventy-five pounds of metal.

The New Almaden Company is now engaged in building a new and very large furnace, and in cutting a tunnel eight hundred feet below the present entrance of the mine. These improvements will enable them to increase their productions considerably.

The Honey Lake Silver District.

A correspondent of the *Silver Age*, after describing his journey of 200 miles from Carson City to Humboldt City, Honey Lake Valley, says:

Humboldt City lies in a cañon at the end of a spur of mountains, which hems about due east from the forks of the Honey Lake road, and the old emigrant road, and about eight or ten miles from the ferry. The distance from Humboldt City to Honey Lake is estimated to be about 135 miles. The greater portion of the people here are from that place. The road is as good as it is from Carson. From the forks of the road to the city is about two miles and a half, and all ap hill.

The city is located at the head of a ravine, down which a magnificent stream of pure, cold fresh water rushes, all the year round. Feed is splendid, and stock improves rapidly. There are about fifty men here in this cañon, and nearly every one has his horse and gun. There are about a dozen or fifteen teats and stone houses, and several more in process of erection. About five miles from this cañon lies the Prince Royal lead, besides many others, in a much smaller cañon. There are about the same number of people and houses there as in this place, although this point (Humboldt City) is deemed the most desirable for a permanent town location. Property in the way of city lots has already commenced to be of some considerable importance. At first each man possessed upon lots here and there; took up and claimed what he pleased; but after different leads were opened, and some value laid upon lots, a meeting of the citizens was called, and resolutions passed restricting all to but one lot of fifty feet front each; and to have thirty dollars worth of improvements put thereon within thirty days, or the same should be jumpable; six days labor, at five dollars a day is regarded as sufficient. Streets have been laid out, and now there is some system about it, which promises little or no trouble in the future. Although some few try to hold from one to two hundred feet frontage yet; but any one who comes along and wants a lot to occupy will have no difficulty in obtaining the same.

In speaking of the ledges or lodes here, I hardly feel competent to do justice to the same, as I have not been here sufficiently long to have become familiar with them; that there are good leads here, no one who has seen them will deny, and some have been worked enough to satisfy any one of their richness.

The great disadvantage the miners have labored under has been from the want of tools, powder, fuse, etc.; and the shortness of their cash has been a successful preventive to their working them, up to this time. I have seen the various leads here, and judging from what I have seen in Nevada, they compare well. The quartz is excellent, and the mineral growing fine. If they could be worked, a month or two would tell the story.

I have already seen specimens of gold, silver, copper, iron and cinnabar.

A day or two before I arrived here, two men started for the Goose Creek mountains (which is the eastern boundary of our Territory) to prospect for gold. These mountains lie about 250 miles distant from this place. Another party, consisting of Messrs. Troop, Scribner and others, left for Gravelly Ford, on the Humboldt, distant about 100 miles; and it is probable, from one or both of these places, the gold which was said to be brought into Carson, came. As for provisions, etc., there is a very good supply here at present, and at moderate rates. Messrs. Nixon and Sylvester have just arrived from Honey Lake with two ox teams loaded. Their price for flour is 15 cents a pound; bacon, 45c; hams, same price; potatoes, 10@12c; other things in like proportion. For small parties coming out here, I should judge it cheaper to buy their provisions here than to pack. Some beef has just been driven in, which is regarded as a treat, sure.

LUSUS NATURE.—David Ury of San Leandro has shown the editor of the *Alameda Gazette* a chicken just hatched, with three legs, the third being minus two toes. It is alive and kicking.

MASONIC.—From the Grand Secretary's report we learn that 142 lodges of Masons have been chartered since this State was organized, of which 133 are at this time in active operation.

SUSPENSION BRIDGE.—An exchange informs us that an enterprising citizen is erecting a wire suspension bridge on the Klamath, near Weippeck.

HISTORICAL SKETCH.***Esmeralda.**

ESMERALDA lies about one hundred miles south-south eastward from Carson City, and fifteen miles northward from the eastern point of Mono Lake, in the basin of Walker river. There is a natural road for wagons through valleys and over low passes, from Carson Valley to the entrance of the Esmeralda mountains, and thence the road is rough for a distance of ten miles. There is a toll road from Walker river to Esmeralda, and a free road from Monoville to Esmeralda. The Esmeralda mountains consists of broken ridges of eruptive rocks, chiefly trap and basalt, covered in many places with volcanic scoria. The general course of these ridges is north and south. Bushy grass is abundant; and there are extensive forests of scrub pine, pitch pine and nut pine, all good for fire-wood, but not valuable for building. Very good water, sufficient for domestic purposes and for the use of steam mills, is found near the mines.

The rich district is supposed to be within a circle five miles in diameter. The elevation of the place is about five thousand feet above the sea.

The main lode, called the Esmeralda, runs north and south, with a width of from thirty to sixty feet of quartz running through porphyritic greenstone. The lode dips slightly to the west, and in some places projects fifteen or twenty feet, like a high wall above the adjacent land. The ore is a vitreous sulphuret of silver, with very little gold.

Most of the other leads in the vicinity run east and west, or, at least, very considerably from the north and south direction of the Esmeralda lode. These other leads are many of them rich in gold.

The town of Esmeralda lies at the base of the hill, on the side of which the claim of the same name lies. Two miles further north, upon a better place for a town site, is the town of Aurora, which now boasts one hundred cabins and tents.

The trade of Esmeralda will probably be done with Placerville, to which place the distance is about one hundred and fifty miles. Communication may be had with Stockton, by the Big Tree route, a distance of one hundred and forty miles; and with Colville, by the way of Mono and Yosemite, a distance of one hundred and twenty miles.

Arizona.

ARIZONA is a district about fifty miles wide, from north to south, and six hundred long, from east to west, laying south of the river Gila, between the thirty-first and thirty-third degrees of north latitude. It is a sterile country, made up chiefly of barren sands and bare rocks. It is rich in gold, silver and copper. Its gold is found in places which cannot be worked for want of water.

Its silver mines were discovered about the beginning of the last century, at which time there was a considerable Spanish population in the country. It is said that at one time a hundred silver mines were worked; but about the middle of the last century the hostilities of the Indians disturbed the labors of the miners, and in 1820 nearly all the Spaniards had left the country, and the business of mining had come to an end.

The most important mine of Arizona, is that of the Sonora and Exploring Mining Company. The mine called, usually, The Heintzelman Mine, from the President of the company, lies in the Cerro Colorado, thirty miles from Tuhac. The ore is argentiferous galena, which, in picked specimens, produces more than \$2000 a ton.

It is said that \$230,000 have been spent in working the mine, much of that sum having been produced by the mine itself. The mine was opened about 1853.

The Cahnabi mine, situated near the intersection of the hundred and twelfth meridian, with the thirty-second degree of latitude, in the country of Papozo Indians, produces a rich argentiferous copper ore. The mine was opened in 1859.

The Mowry mine, in the sierra of Santa Cruz, fourteen miles from the town of Santa Cruz, and 5,160 feet above the sea, has a rich argentiferous galena.

The Santa Rita mine lies in the sierra of Santa Rita, twelve miles east of Tuhac. The ore is an argentiferous galena.

The San Pedro mine, east of the San Pedro river, produces argentiferous copper.

The above are the chief mines in Arizona, now wrought.

The Ajo copper mine, called also the Arizona mine, one hundred and twenty miles south-east from Fort Yuma, is extremely rich. Its ore are oxides and sulphurets. The working of this mine proved unprofitable, and has been stopped.

Coso, etc.

THE COSO silver mines lie about one hundred and twenty miles eastward from Visalia, in the great basin of Utah. It is a barren district, where wood and water are scarce. Rich specimens of sulphuret of silver, and argentiferous copper ore, have been shown in San Francisco, said to have come from that place. There are few miners residing there as yet, and our information about the district is not exact or full.

It is reported that rich leads of silver ore have been found near the Mountain Meadows, in the western part of New Mexico, and also at Silver Mountain, in the same territory; but these are rumors in which little trust can be placed. The Silver Mountain is said to be twenty miles south-westward of Las Vegas, on the road from San Bernardino to Salt Lake, and its ore to be rich argentiferous galena.

* Bancroft's Hand-book of Mining for the Pacific States.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY MAY 25, 1861

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At Fifty Cents per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

Our New Volume.

On the 24th of May, 1860, the first number of the MINING AND SCIENTIFIC PRESS was given to the world. It had long been matter of surprise that no journal of the kind was in existence, in a country so vastly rich in the precious and ignoble metals as California—but remark upon the subject was uniformly met with “such an enterprise would not be appreciated. It would not pay.” We, however, determined to test the question, and accordingly embarked in the enterprise, and we are proud to say, at the end of this the first year of our journal's existence, that we have been successful, far beyond our anticipations or deserts.

For a long time we were forced to creep—now we walk—soon we shall run! We sincerely thank our advertising patrons for their hearty support, and are glad to hear from many of them that they have profited largely by our extensive circulation. Our many subscribers will also receive our thanks, and we promise them that before long we will place the MINING AND SCIENTIFIC PRESS among the leading journals of its class in the world. There are very able scientific writers in California, whose contributions we shall expect to receive and publish. We shall also shortly make arrangements for the receipt of correspondence from all the principal mining points of the State. Already we have dispatched an able correspondent to the Washoe Silver Region, from whom we shall receive a comprehensive weekly letter, the first of which will appear in our next issue.

In the present number will be found a summary of mining news, received from every quarter during the week, comprehending California, Oregon, Washington Territory, Washoe, British Columbia, South America, etc. This will be a permanent feature of the MINING PRESS, and is of itself sufficient inducement to require every miner, who desires to become “posted” in regard to the mineral world, to subscribe for our paper, which is the only one on the Pacific Coast, wherein such information is compiled. The capitalist, for the same reason will find it to his advantage to do likewise. The savan, the agriculturist, the inventor and mechanic, will all find in the columns of the SCIENTIFIC PRESS information well worthy of their close attention. In short, we pledge our paper to be interesting and “progressive.”

Decrease of Treasure Shipments.

The last two steamships for the East took away less than half the usual amount of treasure, owing to the fears entertained by our merchants of the privateers of the Southern States. Rumors to the effect that privateering commissions had been issued by the President of the revolted States, for the especial purpose of intercepting the California steamships and securing California treasure, reached here by Pony Express three weeks ago, and ever since, shippers have been more or less afraid to venture. The ocean steamers have each, in consequence, been supplied with one nine-pounder, two four-pounders and one hundred Hall's improved carbines, with twenty-five rounds of ammunition for each weapon. Arrangements have also been made, so that in case of attack at close quarters, large volumes of steam and hot water can be belched forth upon the enemy boarding the steamer. A steam sloop-of-war has been ordered by the Government to Acapulco, for the protection of our steamers whilst coaling at that port. These precautions, it is affirmed, will insure the entire safety of their passengers' treasure and mails. Instructions have also been given to the captains of the steamships, both on the Atlantic and Pacific Oceans, to give suspicious looking vessels a “wide berth.” We therefore see no reason for continued apprehensions on this score; and we presume that the next shipment of treasure for the East will be very large, as an immense amount of specie has recently accumulated in this city. It perhaps would be better for the material prosperity of the State, if the alarm should not so easily subside, as the plethora would inevitably tend to a great reduction of interest upon monied loans, and a consequent increase of home manufactures and improvements.

Grand Blasting Phenomenon.

The Eureka Company, at North San Juan, a few days since, let off a blast with forty kegs of powder, in their immense claim, the effect of which, according to the *Hydraulic Press*, was very different from all former blasts in these claims. The smoke and flame shot upward in a column, tearing a hole and scattering the top boulders in every direction. Several were hurled into the clouds and descended with terrific force. One passed through the roof of a cabin located in the basin of the claims, and encountering a three inch plank in its course, pierced it with the precision of a cannon ball and buried itself in the ground underneath. Another was thrown to the Half Way House, a distance of nearly half a mile. A third struck Mr. A. Schiller on the fleshy part of the hip, bruising him severely but not seriously. One or two other persons were hit and slightly wounded, while several very narrowly escaped injury.

A distant spectator of the scene says, “the stones continued to descend from the air in a shower, a minute or two after the explosion had been heard.”

THE SIERRA SILVER MINING COMPANY.—This Company appears to be doing a rushing business. A sample of their ore, assayed by Kellogg, Hewston & Co., on the 20th inst. yielded, per 2,000 pounds, 1326.29 ounces of silver, worth \$1,715 49, and 103.19 ounces of gold, worth \$2133 12, or a total of \$3,848 61. Mr. B. Caruthers was the founder of this Company. In 1860 he went to Washoe, and forming the Company, located claims at Genoa, Nevada Territory. There are 1,320 shares of 5 feet each, the capital stock being \$500,000, and all owned by 32 persons. The superficial area of the claims, is 6,600 feet; the lode is 14 feet thick, and has been followed to the depth of 122 feet. The Company's tunnel is now in, 250 feet, and the distance to the main lead is 850 feet. Shares of this Company are not forced upon the market, none of the members desiring to sell out. They are held at \$250 per share. The Company are also, at present engaged in the construction of a circular saw mill—the largest and finest ever constructed on this side of the continent. It is situated in the midst of 1,500 acres of splendid pine and fir timber, owned by the Company.

WONDERS WILL NEVER CEASE.—One day, last month, says the *Alta*, a curious and unaccountable circumstance occurred at the ranch of Mr. Keshaw, near Sausalito. A Portuguese in his employ, named Figaroe, had harnessed up a span of horses to a plow. He went into the house for a moment, and while inside heard a sound like something falling. On running out he found both of his horses lying on the ground—one of them dead, the other nearly so. While engaged with the one that was yet alive, he was suddenly taken ill and fell senseless, and was in that condition when discovered. He was taken into the house, put to bed, and remained helpless for over a week, but is now fully recovered. The horse which was not killed instantly, lived about two hours. The above facts are fully corroborated and authenticated by many persons in that neighborhood. The day was perfectly fine and not a cloud in the sky. What was it?

RELICS OF THE ANCIENT INDIANS.—A few days ago, Norton Bates, Esq., found on his mining claim, at Don Pedro's Bar, in this county, some of the most curious relics of the ancient inhabitants of this region that we have seen. They consist of a tolerably well executed representation of a deer's foot, about six inches long, cut out of slate, and a tube about an inch in diameter, and five inches in length, made of the same material, and a small, flat, rounded piece of some very hard, flinty rock, with a square hole in the center. They are all highly polished as if they had been much handled, and perfectly black with age. What gives a peculiar interest to these relics is the fact that they were found thirty feet below the surface, and over the spot where they were found, a huge pine, the growth of centuries, has reared its lofty head.—*Columbia Times*.

A UNION INCIDENT.—One of our expressmen says the *Eureka Journal*, while recently traveling through the country, stopped at the cabin of an old miner, who anxiously inquired as to the latest news. “Bad enough,” replied the vendor of news; “the secessionists have taken Fort Pickens and Washington City, and hung Gen. Scott.” With a look of unutterable horror, the miner coolly stepped into his cabin, took down his rifle, and exclaimed: “Anybody can take my claim that wants it; but, damn me, if I ain't off for the wars, and I'll have Washington City back or never return!” Our informant assures us that he would have been as good as his word, had he not learned to his great gratification, that he had been the victim of a “sell.”

AN EXCELLENT APPOINTMENT.—One of the most sensible acts of the last Legislature was the appointment of Dr. Lanszweert, one of the ablest analytical chemists and assayers in the country, to the office of State Assayer of Ores and Metals, in the District of Mono. He is a gentleman of the strictest probity and honor, as well as the highest scientific attainments, and as such we cordially indorse him. He will proceed to the scene of his future labors next week,

Correspondence from the Mount Diablo Coal Field

The following interesting letter we commend to the perusal of our readers. We shall be glad to hear frequently from our correspondent “L.”

KIRKEN'S PASS, near Mt. Diablo, }
May 20th, 1861. }

EDITOR MINING AND SCIENTIFIC PRESS:—Knowing your desire to obtain all the reliable information possible, in reference to the mineral and other resources with which the State abounds, and your readiness to give publicity to everything having for its object their development, I avail myself of the privilege which this knowledge gives me, of writing you something derived from actual observation, relative to the coal mines recently discovered in this region. The mines which are now opened and being successfully worked are the Cumberland, Black Diamond, the Clarke claim, so called, and one belonging to Messrs. Adams and Cruikshank.

The first, viz., the Cumberland Company, are now taking out about thirty tons per day, with ample means to increase the amount to one hundred per day, so soon as their road for transportation is completed. The coal in this lead is about four and a half feet in thickness, and undoubtedly extends over a surface of many miles. The Black Diamond lies about sixty rods northeasterly from the Cumberland, and so far as I am able to judge, possesses all the advantages of the latter, with the additional one of a much better quantity of coal. The Clarke Claim, as it is called, is situated about one and a half miles northeasterly from the Cumberland, and the proprietors are now taking out about forty tons a day.

The Adams & Cruikshank Lead is situated near the Clarke. This company, having but just opened their mine, are not taking out so much as the others; but its yield, as also that of the Clark Lead, will be fully equal to any others. In addition to the name named, there are some ten or twelve more claims being tested, which promise to equal the best, and it is confidently expected that, in six months from this time, there will be 500 tons of excellent coal thrown into the market daily from these mines.

These facts, together with others, have recently turned the attention of some enterprising gentlemen toward the necessity of some means of transportation which shall meet the increasing demand at these mines; consequently, an application was made to the Legislature for a charter to run a railroad from these mines to Suisun Bay, the terminus to be at or near New York of the Pacific.

The Legislature, in its wisdom, saw fit to grant their request, and interested parties are now taking the preliminary steps to build the road. A meeting of the stockholders was called at Martinez on Saturday last, and a temporary organization effected by the choice of officers, as follows, viz.:

President—William Fitzpatrick.

Secretary—William D. Lawrence.

Treasurer—Erastus Mathewson.

Directors—Josiah Sturges, William Fitzpatrick, C. T. Cutler, J. C. Hunsaker, William D. Lawrence.

Articles of association were adopted, and proper steps taken to commence the work immediately.

The company, I am told, confidently expect to have the road in operation before next winter.

The advantages from this mode of transportation cannot fail to have a tendency to reduce the price, in some measure, of coal, and cannot but be of incalculable value to the consumer as well as the producer; and the working of these mines, and everything connected with their development, must be of infinite value to the State and ought to enlist the sympathies of our capitalists in that direction. I am fully of the opinion that when the mines are all in full blast, the extent of operation will materially cheapen the price of fuel throughout the entire country.

Yours, L.

COAL MINES ON FIRE.—We are sorry to learn that the coal mines near Mount Diablo were set on fire a few days ago, but trust that the next issue of the MINING AND SCIENTIFIC PRESS will announce the extinguishment of the flames.

The Mineral Springs of Mendocino County.

Our attention, says the Mendocino Herald, has often been called to the great number and variety of mineral springs to be found in different portions of our county; and we have been hopeful that some scientific individual, with a fondness for exploring and diving into the hidden secrets of nature, would make a visit among us for this purpose. The water from some of our springs possesses many valuable medicinal properties, as is evidenced by the extraordinary effects its application has upon the human system. Some of these springs are warm—even hot, and it is not unusual to find a boiling stream gushing forth from the bed of a rock, within a few feet of a stream of icy coldness.

There is a warm mineral spring about twelve miles above this place, that has for several years past been the resort of invalids from different sections of the country. Its waters seem to benefit the system for every disease that “flesh is heir to,” without producing the slightest languor or debility.

This spring, we are informed, has been the resort for time immemorial of the native Indians—and is called by them the Great Medicine Man. We have many more of a similar character, but none perhaps so directly beneficial. Sulphur and soda springs gush forth from our valleys in endless numbers, and offer rare inducements for scientific research.

WEEKLY SUMMARY OF MINING.

California.

SIERRA COUNTY.—Times are lively at Spanish Flat, says the *Mountain Messenger*. The following hydraulic companies are now working successfully: Cooley & Wenham, Dearborn & Russell, McLaughlin & Devers, Waterhouse & Co., and John Beam & Co. Dearborn & Russell, as we learn from Mr. Wenham, took out about \$1000 on Tuesday, after but a few days' run, the owners cleaning only fifty feet of their ground sluices. . . . The miners at Secret Diggings are all hard at work. The sluices broken down last winter have been rebuilt, and are now conveying 800 inches to Illinois Ridge and Secret Diggings. None of the Secret Diggings companies have cleaned up this spring, but they are all working in rich gravel with excellent prospects.

The Eagle Company at Port Wine, had struck a second lead of blue gravel, and have just cleaned up \$735 62, after a week's running. Shares in the company are sold at \$6000 each.

The Sailor Company, working about fifteen men, is doing well. On Sunday morning last, at Kleckner's store, the Sailor boys sold \$713 78, the result of a week's run. The Erie Company took out last week, after a few days' work, \$434 86, from a cleaning of the upper boxes, the amalgam being taken out. The diggings of Cenny & Co. are doing well. The claims of Cassidy & Co., which are nearly worked out, are about as rich as ever.

The main tunnel of the Golden Gate Company has reached a length of 800 feet. The *Messenger* thinks that the claim will prove to be the richest in Sierra county.

The Port Wine miners hold on to their dust, on account of a decline of twenty cents to the ounce.

The mines at Mount Pleasant were paying at the rate of forty and fifty ounces a week.

At Queen City and elsewhere the miners are doing remarkably well.

TOLUENE.—The mines in this country are yielding good returns. The *Columbia Times* says: We are informed that the famous Black's claim, on Knapp's Ranch, will clean up this week, and from the indications in the tailrace, there are parties who are willing to bet that the company will clean up \$20,000. We should not be surprised if they obtained \$50,000.

NEVADA COUNTY.—A quartz lode has just been discovered near Nevada city, which promises to turn out gold at the rate of \$1,000 to the ton. The *Transcript* says that the ledge is twelve feet thick, and of unknown length, and thinks that there are plenty more such around Nevada, like so many oysters suffering to be opened. . . . The same paper says: Notwithstanding the apparent dullness of the times, our banker's buy considerable dust. The amount bought last week is not less than \$40,000. One firm alone bought over \$15,000. . . . We are sorry to learn that so many robbers infest Nevada. Last Sunday night there was an attempt to rob the Nevada Quartz Company's mill; but suspicion being aroused, a watch was set, and a man seen stealthily approaching the mill about 11 p. m., was fired upon, when he took to his heels. An hour or so later another man with a light appeared at a distance, but he retired, being evidently afraid to come nearer.

YREKA.—The *Yreka Journal* of the 18th says: We learn that Mr. Quick, of Cherry creek, in this county, found in his claim a few days ago, a lump of pure gold weighing nineteen ounces. The claim referred to is situated near the head of the stream.

PLACER.—The *Courier* of the 18th informs us that the proprietors of the Kate Hay's mining claims, near Forest Hill, Placer county, have just struck upon a quartz ledge which, as it is opened, indicates greater richness than any ledge which has yet been discovered in this region. It is about a foot in width but widens as it is opened. Although the company have quarried into the ledge but three or four feet, several rich specimens have already been removed. The quartz is of a soft crumbling nature, not unlike air-slacking lime. Dirt on the sides of the ledge has paid as high as three dollars to the ton.

AMADOR.—A Volcano correspondent of the *Ledger* writes: The late flood did great damage to the mining interest near this place. The filling up of the "Open-cut Flume, retarded mining operations very much. Most of the miners were compelled to abandon their claims for several weeks, to assist in removing the obstructions. Everything is now going on as usual. The miners have resumed work on their claims; water cheap and the claims are all paying remarkably well.

EL DORADO.—The excitement consequent upon the discovery of a rich gold and silver lode near Cox's Station, 28 miles from Placerville, still exists, and more extended and richer discoveries than those mentioned in the last *Californian* have since been made.

CALAVERAS.—We learn very little as to the gold yields of this county during the past week; but a lode of copper-bearing rock has been discovered near Bear Mountain, and has been traced for a mile and a quarter.

SHASTA.—The Roaring River claims, near Shasta, says the *Herald*, are turning out \$9 and \$10 per day to the hand.

The Colorado and Los Angeles Mines.

The Los Angeles *Star* of a recent date, states that operations on the Colorado Mining Company's San Antonio

lead are being carried on in a most vigorous manner. Heretofore the Company were working the offshoots, as it were, but now they have come upon a rich and well-defined vein, which has been repeatedly tested and assayed, and proves to be richer than was anticipated. In one piece of rock, a thread of pure silver fully an inch and a half long, was found. Specimens of the mineral appear to be very rich.

The Jayhawk Company are also taking out good mineral, as are the Mayfield Company.

Intelligence of the discovery of rich silver ore at the Colorado river, is confirmed by Mr. Dampin.

A road has been surveyed from the mines at Potosi to the river, distance 40 miles.

About 60 persons are at work at Potosi, a stampede having taken place for Bear Valley; but the men are retreating, considering the mines at that place overstocked. Some intended visiting the Gila before returning to Potosi.

A telegram from Los Angeles dated May 17, gives the following information:

Several large parties of miners left here for the mines at Holcomb Valley, during the week. Large quantities of gold have been obtained from the placer diggings in the valley during the last few weeks. A large amount of dust has been brought to this place. A gentleman just arrived, reports further discoveries of rich placer diggings, and several veins of gold quartz. Mining goes on vigorously on the San Gabriel, The Driver Company are making an average of \$10 a day to the hand. The Blakely Company have struck a rich lead, and are taking out large quantities of gold. All the miners on the river are doing well.

A Remarkable Discovery.

The *Columbia Courier* gives an account of a singular discovery near Sonoma. The owners of a claim while hydraulicing a steep bank, about seventy feet in height, were suddenly surprised by the caving down of an immense amount of gravel, limestone, boulders and lava, which revealed beyond, in the heart of the hill some hundreds of basaltic columns of a dark brown color, pentagonal in shape and standing perpendicular, from ten to twenty-one feet high. The open space between these pillars nowhere exceed four or five inches, and rows of them run into the hill from thirty to fifty feet, closely packed together. In some places, at certain angles, it is possible to see beyond this colonnade into an opening, formed apparently of quartz rock, which is certainly rich in gold; for even at that distance from the observer, in a kind of dim twilight, strong indications of the metal are quite visible.

Rays of light seem to penetrate into this opening through fissures in the roof, sides, or from the rear, although the diligent search of hundreds have not as yet led to the discovery of any of them, or of any probable avenue through which light could enter. The hill is thickly covered with chaparral, which makes the search difficult and unsatisfactory. The well known geologist of Columbia has been to the spot and examined the place with great attention. He reports that the columns are exceedingly hard, unusually regular in shape and closely packed together; that their igneous origin is very apparent; and that on examination he found augite, feldspar, titanite iron and olivin in their composition. He is certain that this is the only instance so perfect a basaltic development of rock has been found in California—although he has seen as good a development in the West Indies—and he considers it, among all the geological discoveries in this country, as by far the greatest and most worthy of scientific observation. As might be expected, the whole hill, and one or two adjoining, are staked off into claims, and excitement and speculation reign supreme in Columbia, in Sonoma, and all the surrounding camps.

CALIFORNIA WINE.—We chanced yesterday to "drop in" to the long range of stores (eight in all), of Messrs. Hobbs, Gilmore & Co., on Market street, Nos. 211 to 225, and there tasted three kinds of California wine, viz: white, angelica, and port, made at the Lake Vineyard in Los Angeles county, by the proprietor, B. D. Wilson, Esq., who last year put up 40,000 gallons. The samples we tasted were certainly equal if not superior to any wines of California make that have within our knowledge reached the market.

A NEW MAP.—We acknowledge the receipt of a "Skeleton Map of the State of California, exhibiting the U. S. Township and range lines, and boundaries of U. S. land districts; the county seats, and the lines of equal variation of the compass, compiled from authentic sources for the California Academy of Natural Sciences, by Leander Ransom"—for which that gentleman will accept our thanks.

TRIPLETS.—The *Argus* states that the wife of Mr. John Madden, of Stockton, gave birth, on Sunday last, to three daughters, each weighing eight pounds! Dr. Gratton was the physician on the occasion, and we are informed that the little ones and mother were all doing well.

There is a fatal disease prevalent among the hogs in Tehama county. One person has lost as many as fifty hogs lately. The animals are said to exhibit no symptoms of illness till they fall and die.

PROJECT FOR IMPROVING NAVIGATION ON THE WILLAMETTE.—There is a project in contemplation of constructing locks to connect the Upper and Lower Willamette at Oregon City. The *Oregonian* remarks that the facilities on the Oregon city side are great for carrying out the enterprise. The cost would probably be more than \$100,000. Three locks would be required; at the same time a portion of the river would be brought into the town in a way that would furnish vast and convenient water power, which would make the City of the Falls a manufacturing place, and secure its permanent prosperity.

VIRGINIA CITY.—This city contains 430 houses and 2580 persons.

HAWLEY & CO.,

DEALERS IN

Hardware, Building Materials, Carpenter's Tools, AGRICULTURAL AND MINING IMPLEMENTS, Circular, Mule and Mill Saws, Blacksmith's Tools, Cordage, POWDER, FUSE, ETC., ETC.

TO FARMERS.

We have the following Machines, which we will sell at greatly reduced prices:

ESTERLY'S SELF-RAKING REAPER AND MOWER. Which gave better satisfaction to Farmers last season than any other Machine. Also, the

KENTUCKY HARVESTER,

A Combined Reaper and Mower. Also,

KETCHUM'S TWO-HORSE REAPER AND MOWER,

Ketchum's one and two-horse Mowing Machines. Also the justly celebrated

BUCKEYE MOWER,

The best Mowing Machine in the world. Its superiority over other Machines is that it has two driving wheels, which support the whole weight of the Frame, Gearing and Driver, giving it nearly double the power of a machine which has but one Driving Wheel. It has a double hinged finger bar (which belongs exclusively to the Buckeye Mower), which can be raised to pass obstructions. The bar can be folded over the top of the frame with perfect ease, so that it can be moved from place to place without trouble. It has no Cog Gearing in the Driving Wheels; it is entirely free from side draught, and has no weight on the tongue or horses' necks. The draught is lighter than ordinary plowing. Also,

RUSSELL'S PATENT THRESHING MACHINES,

Made by Nourse, Mason & Co., Boston, Mass.

Farmers will find it greatly to their advantage to call and examine these Machines before purchasing for the coming Harvest.

For sale by

HAWLEY & CO.,

my23 Corner of Battery and California streets, San Francisco. Corner of E and First streets, Marysville.

CALIFORNIA WINE.

CARD.

LAKE VINEYARD, Los Angeles county, Cal., }
March 21, 1861. }

BEING OFTEN APPLIED TO BY ACQUAINTANCES THROUGHOUT THE State for my Wine in small quantities, I hereby notify them, as well as the public generally, THAT I HAVE APPOINTED

Messrs. Hobbs, Gilmore & Co., of San Francisco,

MY SOLE AND EXCLUSIVE AGENTS

For the State of California, for the sale of all the different classes of Wine manufactured by me at Lake Vineyard (and that they cannot be obtained of any other parties) giving the assurance that they will obtain from them the same article in every respect as I have in my cellars B. D. WILSON.

NOTICE.

In conformity with the above card, the public are informed that we, the subscribers, have for sale, at our

WINE CELLARS,

Southeast corner Market and Beale Streets,

Nearly opposite the Railroad Depot.

PURE WINES,

CONSISTING OF

Port, Angelica and White Wine, }

All warranted to be the pure Juice of the grape.

Which we will sell in quantities to suit purchasers, put up in shipping packages, or otherwise.

my23

HOBBS, GILMORE & CO.,

Market street, opposite the Railroad Depot.

WE ARE NOW PREPARED TO RECEIVE GUESTS

—AT OUR—

NEW SALOON,

327 Montgomery street, TUCKER'S BUILDING,

—FOR—

BREAKFAST, LUNCH, AND SUPPERS,

Where will be kept on hand every variety of CONFECTIONERY, JELLIES, ICES, PASTRY, CAKES and BREAD. Our Manufactory is on the premises, where we make every article sold from our counter. We are prepared to furnish Balls, Weddings, Reception Parties, or Families, with every article desired, in small or large quantities. All will find it to their advantage to examine our goods, as they will find them manufactured from the very best material, and with utmost care, and sold at reasonable prices. The Manufacturing Department is under my own immediate supervision, and having had over twenty years experience in our business, we feel much confidence that we shall please the public. All goods sent free of charge. my24 JNO. J. HALEY.

AGENCY FOR PATENTS.—The undersigned having been long established in the Patent Agency Business, and having favorable arrangements for attending to the interests of inventors at the Patent Office in Washington, offer their services for the securing of Patents and Patents also, will attend to the sales of Patent Rights, and to all matters connected with patented inventions.

WETHERED & TIFFANY,

Office, Market street opposite Montgomery

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Considerable activity in mining sales during the last ten days up at Virgin City!

Potosi, \$200 per share.
 Central, \$700 per share.
 Ophir, \$1100 per share.
 Gould & Curry, \$300 per share.
 Chollar, \$8 per share.
 Lucerne, \$25 per foot.
 St. Louis, \$6 per foot.
 Mount Davidson, \$30 per share.
 Mark Anthony, \$8 per foot.
 Louise, \$16 per foot.
 Bradley, \$8 per foot.
 Sacramento, \$6.
 Shelton Co., \$5 per foot.
 Josephine, Flowery, \$8.
 West Branch, Flowery, \$8.

 [Having completed all the requisite arrangements, we shall in future be able to lay before our readers a reliable list of prices of mining stocks of Utah.]

Camroux's Portable Quartz Crusher.

The following is from the Castlemaine (Australia) *Advertiser* of a recent date:

"The necessity of discovering a cheap and efficient quartz-crushing machine has long been felt by the mining community of our gold-fields, indeed, we cannot conceive an invention that would prove a greater boon to the colony in general. It is impossible to attach too much importance to any *bona fide* improvements in that branch of mechanism that may be brought under our notice. Science has labored long without success to point out some means whereby the many thousands of arduous reefs, yielding from one to five pennyweights a ton, now laying idle, may be rendered remunerative to the working man. In order that this may be done it is necessary to reduce the stone rapidly and effectually with the least possible wear and tear, by a machine that may be erected for a sum considerably below that usually required for an efficient plant. All these qualities, we are of opinion, are combined in an invention recently patented by Mr. F. O. Camroux, of this town, a description of which we have much pleasure in laying before our readers. The principle consists in the simple action of two conical discs with corrugations, set face to face at an angle of eighty-five degrees, but revolving in the same direction, each on its own axis. The discs are driven from the same shaft by a spur-wheel and pinion, at a speed of three hundred revolutions a minute by the aid of a five horse power engine, and these being enclosed by a casing, the quartz or schist, cement or other mineral, passed into the machine, cannot leave it until completely pulverised. The entire machine is fitted to a cast-iron foundation plate, occupying the incredibly small space of four feet square, so that it is capable of being placed on a dory complete, and immediately conveyed to any locality desired.

Amongst the many evident advantages which this quartz-crushing machine possesses over any other hitherto placed before the public, we may enumerate the following:

1st. Its indisputable capability to reduce the quartz to the finest powder. 2nd. The rapidity with which it is reduced. 3rd. Its portable character. 4th. Its cheapness.

The patentee is prepared to guarantee that the machine will crush at least one hundred tons a day, the calculation not being based, as is frequently the case, upon mere theory, but from the actual performance of a working model.

The metal is crushed in a dry state, entirely without the use of water. We are also informed that a full sized machine complete will only cost between £300 and £400. The simplicity of its action seems to convince us that the wear and tear would not be great—the quartz being literally crushed (not ground) by a steady and irresistible pressure. The cost

of crushing could not therefore exceed one shilling or one and sixpence a ton.

The inventor is sanguine enough to anticipate in his machine a perfect revolution in the science of quartz-crushing, feeling convinced that it must supersede the present slow and crude system of crushing by stampers. It is his intention, we believe, to apply the principle to stone-breaking, and we see no reason why, if set to the proper gauge, it should not be as successful a stone-breaker and bone-crusher. The model is at present on view at Mr. Anderson's, watch-maker, Barker street, and we would recommend all who feel interested in the subject to witness its action.

Mount Davidson Tunnel.

The officers of this company says the *Alta* of a recent date, have completed a contract with parties in this city for the completion of this important work.

Under a previous contract the tunnel had already been carried in five hundred feet, with an open cut extending to in entrance forty feet in length. This had been paid for its cash. Payment for the additional work, consisting of two thousand feet, is to be taken entirely in the stock of the company, the amount being \$25,000—making the whole expenditure, when this shall have been completed, something like \$30,000. By this arrangement the members of the company are relieved, not only from further cash payments in carrying on their work, but also from the annoyance attending the levying and collection of assessments, a consideration that cannot fail to enhance the value of their stock.

It strikes us that it would be well for other joint stock companies to adopt a similar method for prosecuting their works or prospecting their claims, as it is the dread of these frequent calls for the payment of assessments, more than anything else, that deters parties from buying into mining grounds. By this means every member is relieved from anxiety on that account, and enabled to make some reliable estimate of his future liabilities. Should this plan be generally adopted it would tend much to stimulate mining operations, as every company could initiate proceedings without being compelled first to call upon capitalists for assistance. It would of course only be in cases like this of the Mount Davidson Company, where the project is known to be a good one, that contractors could be found to engage on these terms; yet where a work did not possess sufficient merit to command the confidence of practical business men, no one should enter upon it.

After this heavy outlay for the completion of their tunnel, the company have still on hand a contingent fund of \$190,000 in stock, designed for the erection of works and the purchase of machinery when required.

The contractor is a man of energy and experience in the business, and pushes the work on rapidly, it being his intention to employ three sets of hands, working by relays, day and night. This being the case we may expect to see this gigantic pioneer tunnel brought to completion at an early day. —*Terr. Enterprise.*

TEETH! TEETH! Extracting without Pain! In W. H. Irwin, D.D.S., Third street, near Howard (opposite Estill's Mansion) All branches of Dentistry performed in the neatest manner.

Extracting, each, \$1.
 Extracting children's teeth, 50 cents.
 Filling with gold, each, \$1, \$2 and \$3.
 Filling with platinum cement, \$1, \$2 and \$3.

TO OUR FRIENDS AND THE PUBLIC AT LARGE.

J. C. MEUSSDORFFER, HAVING RETURNED FROM HIS BUSINESS VISIT TO PARIS, desires to invite the whole hat wearing community to favor him with a visit, and inspect the largest and most beautiful assortment of

Gents', Ladies', Misses', Youths' and Infants' Hats and Caps. Ever exhibited west of the Atlantic. They were selected by Mr. Meussdorffer himself, who has eleven years experience in this State, and who feels confident that all, even the most fastidious, can be suited. Our Department for Ladies and Misses contains, among others, the following new styles:

EXPRESS EUGENIE, ANDALOUX MARRON, IRLANDAISE MONLOW,
 BOLERO MONLOW, IRLANDAISE GISELLE, BOLERO MARRON,
 TEDOR NOIR, FRANCOIS FANTASIE.

Our extensive arrangements in Paris and New York enable us to sell any kind of Hats at least fifteen per cent cheaper than any of our competitors. Mr. M., having had some very superior MOLESKIN PLUSHES manufactured expressly for him at Lyons, is prepared to produce a finer MOLE HAT than was ever before manufactured. Our prices are:

No. 1 Extra Super Mole Skin Hats, made to order,	\$6
No. 1 " " " " " "	"
No. 1 " " " " " "	"
Imported " " " " " "	5
Imported " " " " " "	4

Meussdorffer's stock of SOFT HATS, CAPS and STRAW HATS, is the largest in the State, and receives additions of the newest styles by every steamer from Paris and New York.

Every one and all,
 Please give us a call,

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission
 and Howard, San Francisco, California.—By recent additions to our be-
 fore extensive establishment, we can confidently announce to the public
 that we now have

The Best Foundry and Machine Shop on the Pacific
Coast.

With upwards of forty-five thousand dollars worth of patterns, we are en-
 abled to do work cheaper and quicker than any other establishment on this
 side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines,
 both Marine and stationary; Straight Quartz Mills of all sizes and
 designs; Stamp Shoes and Dies of iron, which is imported by us expressly
 for this purpose—its peculiar hardness making shoes and dies last two or
 three months. Mining Pumps of all sizes and kinds; Flooring Mills; Gang,
 Sash, Muley, and Circular Saw Mills; Shingle Machines, cutting 25,000 per
 day, and more perfectly than any now in use. One of these shingle machines
 can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hans-
 com's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now
 in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron.
 Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers;
 Smut Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lum's Pat-
 ent; and to make a long story short, we make castings and machinery of
 every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to.
 Thankful to the public for their many past favors, we would respectfully
 solicit a continuance of their patronage. Before purchasing, give us a call
 and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This MILL will Crush, with the same weight
 of Stamps, Twenty-Five per cent. more rock
 than any other mill yet invented. It is also
 Cheaper, more Durable and run with Less
 Power. All parts of it being fitted together
 before leaving the shop, it can be put up and
 set at work Crushing the Ore, in Ten Hours af-
 ter arriving on the ground!

Every one exclaims after seeing the Mill in
 operation, "Why has not so perfect and yet
 simple a mill been invented before? It would
 have Saved the Fortune of many a Miner
 expended in worthless machinery, and enriched
 the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe.
 Bartola Mill Company, }
 Ophir Mining Company, }
 Union Reduction Company, } San Francisco.
 Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated
 Vermont Reaper and Mower, which is unsurpassed for Simplicity, Dura-
 bility, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who
 have used it, justifies the expectation that, with the late improvements, it
 will become the leading machine, when its superior qualities are generally
 known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE
 HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to un-
 even surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in
 constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving
 his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to
 give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently
 you back away from obstruction, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up with-
 out removing bolt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient
 at the corners of the land; when raised, the machine will turn as short and
 easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it
 easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one
 for mowing, the other designed expressly for reaping, which, with other
 improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchas-
 ing. KNAPP, BURRELL & CO.,
 ap19 310 (Old No. 80) Washington street, near Front, San Francisco.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SPECI-
 ALISTIC American Patent Agency of Messrs. Munn & Co., and for more than
 ten years officially connected with said firm, and with an experience of
 fourteen years in every branch relating to the Patent Office, and the inter-
 est of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN
 APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other busi-
 ness pertaining to the obtaining of Letters Patent, will be executed for a fee
 of \$25. For arguing the case in the event of a REJECTION, and for appealing
 it to the Commissioner, no additional fee will be required. In cases of in-
 terference or in an Appeal to the Circuit Court a reasonable extra charge
 will be made.

For a fee of \$5, a preliminary examination will be instituted at the Pa-
 tent Office, and a reliable opinion given as to the probability of securing a
 patent. More than four thousand examinations of this character were con-
 ducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE CO. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city
 as Solicitor of Patents, I cheerfully state that I have long known him as a
 gentleman of large experience in such matters, of prompt and accurate busi-
 ness habits and of undoubted integrity. As such I commend him to the In-
 ventors of the United States.

THE WASHINGTON MARKET.

SAN FRANCISCO, although comparatively small in size, is noted for having the best market of any city in the world. Her markets may not be so large as those of other cities, but they contain a variety of products such as can nowhere else be seen collected together under one roof. The finest of them is the Washington market—an excellent sketch of which has been produced by our artist and engraver.

The building has recently been enlarged, and now covers an area of over 22,000 square feet of ground. It is situated, as most of our readers are aware, in the block bounded by Montgomery, Merchant, Washington and Sansome streets, fronting on the last three. It is built of brick and faced with slabs of granite. The front on Sansome street is pierced by seven lofty arches (eight feet wide); on Washington street by nine; and on Merchant street by seventeen. This immense building is filled with a great number of stalls and stands, placed in the most convenient and tasteful positions; and the light of heaven streams down from above through skylights.

Here, at every hour of the day may be seen men, women and children, making purchases of the necessities and luxuries of life; but the grandest time of all is on Saturday night, when beneath the brilliant gas jets may be seen the liveliest scene imaginable. Beef, mutton, pork, and other raw meats; green beans, peas, asparagus, new potatoes, radishes, beets, coconas, and every other description of vegetable; bananas, oranges, tomatoes, apricots, apples, pears, peaches, prunes, peanuts, pomegranates, plums of every variety, grapes ditto, strawberries, raspberries, currants, gooseberries, nectarines, blackberries, huckleberries, cranberries, and all other kinds of fruit and nuts, known to the world; besides magnificent salmon, sturgeon, bass, trout, whitebait, gurnet, flounders, &c. &c. &c.; all kinds of cold cooked meats and relishes; oysters, clams, muscles, lobsters, crabs, shrimps, &c.; flowers of every kind—are all to be seen there on Saturday nights, together with the happy faces of laughing beauties, and the sound of their winning voices, keeping time to the (to some) still more bewitching music of gold and silver, changing hands. The Washington Market is owned by H. F. Williams, Esq., E. J. Chase, Esq., being the overseer and manager, under whose direction, too, the recent addition was built.

The Copper Mines of Del Norte.

In the last issue of the MINING AND SCIENTIFIC PRESS, we published an interesting correspondence relative to the yield of copper found in the vicinity of Crescent City, Del Norte county. The following extract from the Crescent City Herald, of May 11th, corroborates what was before reported:

"We are glad to have some news to report about copper in this vicinity which proves beyond doubt the richness of the mines, and which should stimulate increased exertion in prospecting for and working them. It will be remembered that last fall the Alta California Company shipped a lot of ore from their mine to the East for sale. The returns from it have been received, showing very handsome and remunerative results. The average yield of the ore was a little over forty-five per cent. of the pure metal; the average price obtained, three dollars and eighty-seven cents for each one per cent. of such pure metal, and the average amount received a ton, about one hundred and seventy-two and a half dollars.

This company, then, has been well paid for their energy and enterprise in developing their mine, which until this actual test of shipment was made, was at least but an experiment. Let their well deserved success induce others to follow in their footsteps. We have undoubtedly a rich copper region, one well worthy not only the attention of miners here, but of capitalists elsewhere.

STEAM IN MEXICO.—A small steamboat in sections, destined to ply on the inland waters, has been shipped on the schooner Emma, which sailed a few days ago from this port to Mazatlan.

What California Should Raise.

In an article upon the subject of California's producing capability, the Herald says:

"We imported last year, of raw sugars, equal in round numbers to 17,500,000 pounds which, at an average of eight cents per pound, would give \$2,400,000; and of refined sugars, 4,540,000 pounds, which, at an average of twelve cents a pound, would give \$544,800 more; total for sugars, \$1,944,800. Our rice imports are annually about 19,000,000 pounds which, at an average of four cents per pound, gives \$760,000. In like manner we imported tobacco last year (chewing and leaf), to the extent of 4,542,000 pounds which, at an average of thirty cents per pound, gives us \$1,626,600 more.

Now, here are three articles alone, the aggregate value of which is \$4,667,400, and all of these might as well be raised and prepared for use, in California as out of it—as readily indeed, and perhaps as cheaply, as wheat is raised and turned into flour; or more cheaply if the right kind of labor were employed.

SCARCITY OF COIN.—Owing to the scarcity of coin in Nevada Territory, the citizens there favor the issuance of home-made coin, of the denomination of five dollars ten dollars and twenty dollars.

BLOWN UP.—Gilbert's oil works, at San Buenaventura, were recently blown up. The buildings took fire and were consumed, together with the entire machinery and a large quantity of oil. No person was injured by the accident.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved

AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz.

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grat: bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as in under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,

COUGHS, COLDS, CONSUMPTION,

NEWELL'S
PULMONARY
SYRUP.WHOOPING COUGH, BRONCHITIS,
ASTHMA, SORE THROAT,
ETC., ETC.,

Are complaints peculiar to no place, climate, class or condition of men. They are the common, every-day complaints all over the world. Would you be free from them and their fatal consequences? Try NEWELL'S PULMONARY SYRUP. No article of the kind ever offered to the public has met with such universal approbation.

Keep a bottle of it in your house, and when you feel that you have taken a slight cold, use it at once. Delays are proverbially dangerous, even in business affairs, and when exercised in relation to health, produce the most unfavorable results. No wise man would delay, for a single moment, to extinguish the spark that threatened to consume his house or his goods. Is the boy and his condition less valuable than goods and chattels?

Try the Pulmonary Syrup, and I am sure of your most favorable testimony to add to that of all those who have already done so. Sold by the Druggists generally. Manufactured and for sale by WM. NEWELL, ap19 70 Merchants street San Francisco.

TO GOLD AND SILVER MINING COMPANIES.

The Pacific Metallurgical Works, North Beach,

Are now prepared to crush all kinds of Rock or Sulphurets, and of a suitable fineness for sale or reducing. For terms, etc., apply to

OF THE

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR!

VOLUME III.—NEW SERIES!

A new number of this extensively circulated paper commenced March 30 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly or its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his invention into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as a Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with a large amount of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers! This Journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

Terms.

To mail subscribers:—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 50. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

ANOTHER PREMIUM AWARDED TO THOMAS DONOLLY, AT the Alameda County Fair, held in June, 1860, for the best manufactured CALIFORNIA YEAST POWDERS.

Read the report of the Committee, which is a sufficient guarantee for the superior quality of T. Donnelly's California Manufactured Yeast Powders, and which are now admitted to be superior to any now in use in California or elsewhere. The following is the report of the Committee:

"We would notice as worthy of patronage the very superior Yeast Powders on exhibition by T. Donnelly, having tested them, and found them much better than any other. Mrs. J. B. Weller, Mrs. C. M. Wentworth, Mrs. S. E. Alden, Mrs. F. K. Shattuck, Mrs. Dr. Newcomb.

The above decision is a satisfactory guarantee of the superior quality of T. Donnelly's Genuine California Premium Yeast Powders.

People of California! encourage home manufacture, and in the one article of Yeast Powders, you will benefit the State several thousand dollars a year that are taken away for an imported article that cannot compete with your own manufacture.

Try Donnelly's Yeast powders, and you will find them superior to any. None genuine unless labelled on the top of every can, and dated, 1860.

A JOURNAL OF SCIENCE, ART, MINING, AGRICULTURE, MANUFACTURES, CHEMISTRY, INVENTIONS, ETC.

VOL. III.

SAN FRANCISCO, SATURDAY, JUNE 1, 1861.

NO 10.

Free Invention No. 49.

BY J. L. THOMAS, THIRD U. S. ARTILLERY.

The object of the invention now proposed and submitted for the consideration of military men is to increase the range of our present rifle cannon, as well as to make the rotary motion of the projectile available for cutting purposes; also, to make the shot magnetic, that it may move with more precision in the latter part of its course, against the greater line of metal on shipboard of an enemy. The advantages of a ball that would accomplish this, even if its cost be ten times as great as an ordinary one, is clear to every observer, even should we only land half the weight of metal intended for the piece; for in this way we could commence an engagement out of harm's way, and then, on the approach of the enemy, we might use the ordinary shot. The adjoining cut represents the projectile and its manner of operation:

A in Fig. I is a wrought iron cylinder; E in Fig. 1 is the forward part of the projectile, and is cast in the end of the iron cylinder. This part of the ball will be faced with steel, so that the grooves F, in Fig. II, may cut or bore into the object aimed at as soon as the ball strikes it. The grooves will also assist to keep up the rotary motion of the ball on the trajectory, and, indeed, increase that which it obtains on leaving the cannon's mouth. Under our present system, the rotary motion of the ball when it strikes an object is turned to no account. Now, as we can cut an object with less power than we can break it, the advantage of using this rotary motion for cutting purposes is very considerable. C is a chamber filled with powder or other combustible; D, the fuse orifice through B, which is of lead, being of greater specific gravity than iron, which will make up for loss in weight of the ball by powder, etc. We charge the ball by filling the chamber with powder, inserting the fuse through the fuse orifice of the leaden plug. We then insert the plug, which will fit closely and rest on the flanges of the powder chamber; the fuse will then be gaged for the highest point of the trajectory, and will be ignited by the discharge of the piece. Now, when the ball has reached the highest point of the trajectory, or near it, a second discharge will take place in the ball, forcing out the leaden plug, which will fall to the rear. As this discharge checks or stops the leaden plug's original momentum, the forward part of the ball, with its cylinder, will take up a new velocity; hence, we increase the range, although the ball is reduced in weight; for if the leaden plug should only weigh three pounds, and at the time of the second discharge moves at the rate of 800 feet per second, this would give us some 2400 pounds power to be applied in imparting to the ball proper a new velocity. The principles laid down are worth at least proper experiment.

CALIFORNIA SOUND TO THE CORE.—During the past few weeks the people have assembled in mass meeting in nearly every city, town and village of California, and expressed in the most decided manner their unalterable determination to rebuke treason, to lend their moral support to the Government of the United States, and if necessary to shed their best blood for its defense. We are proud of our patriotic State, over whose broad, beautiful fields and rich mines, and beneath whose bright sky, the "flag of the free heart's hope and home" will ever float.

PESTS.—Grasshoppers have appeared in vast numbers a Washoe; so have locusts. Together, they are playing "old Harry" with the crops and grass.

UNION PROJECTILE FOR RIFLE CANNON.

EXPLANATIONS TO FIG. III.—A—Line of sight; B—Axis of the piece or line of fire; C—Trajectory; D—Point of discharge of the projectile; D D—Point blank.

Rotary Mills—The McCulloch Process, &c.

The following extract from Washoe correspondence of the *Bulletin*, we publish without endorsement, as certain statements therein made, require corroboration:

The rotary principle of crushing seems to have proven itself an expensive undertaking. Out of two batteries it is a safe calculation to allow one to be at a stand-still, undergoing repairs. All the mills at present going up, adopt the upright stamp or crusher, thus passing judgment against the future use of the rotary crusher. I learn that the McCulloch process has signally failed. The Mexicans in that part of Virginia called Mexican town, on C street, are working their process of extracting the ore from the Gould & Curry rock after this fashion: They have a circle of some thirty feet in diameter, boarded on the outside of the circle, in the center of which there is an upright post, probably turning on a pivot, to which is attached a pole, and to which are hitched five horses abreast, which are driven round, thus kneading or stamping the crushed ore, which is moistened and made like stiff clay. The moisture consists of water, vitriol and salt. This process is exceedingly slow, requiring from thirty to sixty days in its operation. This simple process may after all be the basis for the discovery of a mode of properly reducing the rock and extracting the ore therefrom.

WHAT DOES IT MEAN?—The *Tuolumne Courier* of last week, under the head of "The Giant's Causeway," seems to convey an intimation that the reported discovery of such a wonder was, after all, a hoax. says that paper: Our Sonora correspondent writes us that he has been blamed for giving us information about the discovery we noticed in last week's paper, and emphatically denies having done any such thing or knowing anything about it.

SHORT WHEAT CROPS.—From personal observations, and from reports coming in from all parts of Santa Clara Valley, we are satisfied that the wheat crops in this vicinity will be less than one-half the usual yield. All the late sown wheat is an entire failure. All the late sown wheat is an entire failure, while that put in with the first rains will pretty generally mature;—*San Jose Mercury*.

Grape Culture—Wine Growing.

THE soils of our foot hills, says the *Shasta Courier*, are admirably adapted to the growth of the vine, which attains to a vigor and luxuriance scarcely excelled in any portion of our gold and wine producing State. The quantity of land suitable to the cultivation of the vine in this country, is almost incalculable, and the extensive planting this spring, together with the preparations that are in progress to increase the area in the future, are sure evidence that our ranchmen appreciate the fact, and of our annually increasing prosperity. The wine producing districts of Ohio, Missouri, Indiana, Illinois, and Wisconsin cannot by any parity of reasoning be compared with the soil and climate of our State, yet the annual production of wine in the Western States is estimated at two million gallons. All our wines require is age to render them superior to the same foreign grades, with this very important merit in their behalf, viz: that they are free from drugs, or deleterious combinations of any kind. Owing to the extensive demand in recent years for native wine, its price is at present higher than it will be when the grape is more extensively cultivated. At present prices, wine is one of the most profitable occupations connected with the culture of the soil. With us it requires little care or attention, and yet it yields a rich result. In the production of native wines we are all interested. When these can be produced in sufficient quantities they will drive from the market those vile productions that steal away men's brains. In the wine producing districts of Europe, where the article is obtained cheap, isolated cases of intoxication very seldom exist.

TRANSCONTINENTAL TELEGRAPH.—The *Sacramento Union* is informed that it is the intention of the telegraph builders, about to start from that city, to continue the wires from Fort Churchill towards Salt Lake City, to take a portable battery with them, and during summer to receive the first dispatches to the Associated Press by Pony Express at the end of the line, telegraphing through Sacramento. This will continually shorten the time of the passage between the two outer stations, and gives us the news two or three days earlier before the summer is passed. The wire will be laid at the rate of ten miles a day.

THE GRASSHOPPERS IN CALAVERAS COUNTY.—The people of Huntville, at the western extremity of Calaveras county, are complaining of a grasshopper scourge. The insects have become so numerous on the plains that they are eating up every green plant and all the leaves from the fruit trees in the gardens and vineyards of that vicinity. A few days since a gentleman from that place hired a lot of Indians to kill the grasshoppers that were approaching his garden. They worked away for six hours, at the end of which time he gathered up what he could of the slain insects, and weighing them, found the net proceeds to be forty-two pounds!—*San Andreas Independent*.

DAMAGED.—A late frost in San José Valley—the Paradise of California—has seriously injured the young vines and growing crops.

WAR BONDS.—\$27,000 of Oregon war bonds were recently sold here at fifteen cents. \$500 of California war bonds brought forty cents.

THE COSO MINING COMPANY.—This company filed a new certificate in the County Clerk's office a few days ago. The capital stock has been increased to \$2,340,000.

To, Explorers, Discoverers, Prospectors, and Miners, on the Pacific Coast.

8.—**TIN**.—The only ore that is wrought to obtain this metal, is the

Oxyd of Tin. (Tinstone).

Geognostic Situation.—Occurs most commonly in primary rocks, where it is found in veins, traversing granite, gneiss, mica slate, ely slate, and porphyry, and is usually associated with chlorite, iron pyrites, topaz, quartz, fluor, etc. The metal extracted from the ore taken from this situation is called Block Tin. It is also found in alluvium and drift, and the ore is called Stream Tin, from which the metal being extracted, becomes the Grain Tin of commerce.

Extraction.—The ore which is procured from the mines is freed from impurities by stamping (see Gold), after which it is roasted in a reverberatory furnace, which is about seven feet long, five broad and fifteen inches deep. The usual charge of ore is seven cwt., which yields about two thirds of its weight in tin. The ore is again washed; it is then mixed with one fifth of its bulk of coal and a portion of slacked lime, and smelted in the furnace for about six hours, at the end of which the metal collects at the bottom, covered with a black scoria. The tin is then drawn off into a shallow pit, in which it is freed from the scoria on its surface. It is then taken out with ladles, and poured into moulds. The metal is afterwards exposed to a gentle heat in a small reverberatory, by which the purest part melts first, and is conveyed off.

The stream tinstone is melted in a different way. The ore in its powdery state is submitted to a stream of water. It is afterwards bruised and passed through wire sieves. It is then blown, with alternate quantities of charcoal, into a blast furnace, in which, being reduced, it escapes through a channel at the bottom into pits; the scoria being removed as it collects, and thrown again into the furnace. The metal is then put into a large iron pot, where it is kept melted. In this state pieces of charcoal are thrown in. It is then tried, by removing a quantity in a ladle, and pouring it into the pot. If it appear bright, like silver, and of the same consistence throughout, it is pure. After this it is poured into moulds.

Assaying.—Reduce the ore to a coarse powder, wash, and then expose to heat with charcoal until no garlic odor arises. What remains is to be mixed with half its weight of calcined borax or sawdust, and the same quantity of powdered pitch, and subjected to a strong heat in a crucible lined with charcoal. After the pitch is burnt, give a violent heat for a quarter of an hour, and on withdrawing the crucible, a button of pure tin will be found at the bottom, which shows the per centage.

External Characters.—Colors: brown, black, green, white, red, and yellow. Occurs in crystals, and in masses, from the size of grains to that of the fist. Luster, resinous or adamantine. Streak, grayish-white. Structure, lamellar. Gives sparks with steel. Brittle. Specific gravity = from 6.7 to 7.

Chemical Characters.—Decrepitates, but in powder may be reduced to metallic state on charcoal.

Distinctive Characters.—Spathic iron leaves a globule of iron under the blowpipe. Blende is infusible, and not so hard.

Composition.—Tin 77.5; oxygen 21.5; oxyd of iron 0.25; silice, 0.75.

Test for Tin.—To a solution holding the metal present a plate of iron, result = metallic tin.

9.—**ZINC**.—**Geognostic Situation**.—Primary and secondary rocks.

Extraction.—The ore, being hand-dressed to free it from foreign matter, is roasted. The product is then washed, and the heavy part remaining is mixed with one eighth of its weight of charcoal. The mixture is next reduced to powder in a mill, in which state it is put into the pots to be smelted. These pots resemble oil jars in shape. Through the bottom of each there passes a tube, the upper end of which terminates by an open mouth near the top of the pot; the lower end goes through the floor of the furnace into water. The pots are filled to the upper end of the tube with the mixture of ore and charcoal, and an intense heat is applied to them by a furnace. As the ore is reduced the zinc escapes in vapor through the tube into the water, where it is condensed in the form of globules. These are afterwards melted and cast into moulds. To make it still purer, it is again melted, and then well stirred along with sulphur and fat, the former of which combines with the foreign metals, and leaves the zinc nearly pure.

Assaying.—After being roasted, the ore is mixed with one half its weight of charcoal dust, and exposed to a strong heat for one hour in an earthen retort, the mouth of which terminates in water. The metal condensed in the water and neck of the retort is collected and weighed.

The ores used in metallurgy are:

Blende. (Mock lead, False galena, Black-jack).

Geognostic Situation.—Occurs in veins in primary and secondary rocks, generally associated with galena, with iron and copper. This ore is commonly too widely disseminated in its gangue to make it profitable. It is, however, used after roasting in the preparation of brass.

External Characters.—Colors, yellow, brown and black. Occurs massive, lamelliform, disseminated, in granular concretions, and crystallized. Luster, shining and adamantine.

Yields to the knife. Brittle. Structure, foliated. Specific gravity = 3.7 to 4.

Chemical Characters.—When heated, decrepitates. When thrown into oil of vitriol, it gives the smell of rotten eggs.

Distinctive Characters.—Infusible. Does not tinge borax green.

Composition.—Zinc, sulphur, iron and silice.

Calamine.

Geognostic Situation.—Occurs in beds, nests, filling up or lining hollows, in secondary limestone and conglomerate rock; also in veins, usually along with oxyd of iron, and sometimes with galena.

External Characters.—Colors, gray, greenish, or brown yellowish, and sometimes nearly white. Occurs crystallized, compact, amorphous, pseudo-morphous and cupriferous. Yields to the knife. Specific gravity = 3.35 to 4.41.

Chemical Characters.—Infusible. Dissolves with effervescence in muriatic acid or warm aquafortis.

Composition.—Oxyd of zinc and carbonic acid.

Red Ore of Zinc.

Geological Situation.—Iron mines; also in limestone.

External Characters.—Color, red. Occurs massive and disseminated. Luster, shining, by exposure becomes dull. Structure, foliated. Yields to the knife. Brittle. Specific gravity = 6.22.

Chemical Characters.—Infusible. Soluble with effervescence in acids.

Distinctive Characters.—Infusibility and weight.

Composition.—Oxyd of manganese and oxyd of zinc.

10.—**MANGANESE**.—This metal, in its metallic state, has not been converted into any use; but the ore, which answers, without preparation, all the purposes for which the metal is employed, is the

Black Oxyd of Manganese.

Geognostic Situation.—Occurs in veins and imbedded masses in primary rocks; frequently found with the ores of iron.

External Characters.—Color, very dark steel gray. Occurs massive, in fibrous concretions, and crystallized. Luster, metallic. Streak, black. Fracture, conchoidal and earthy.

Chemical Characters.—Infusible alone; but with borax forms a purple globule.

Composition.—Manganese, oxygen and water.

11.—**COBALT**.—Cobalt is not procured in its metallic state for the purposes of art. The preparations of it in general use, are zaffree and smalt. The ore from which they are obtained is

Arsenical Cobalt.

Occurs in veins, traversing primary rocks, associated with nickel, bismuth, silver, arsenic and copper.

External Characters.—Color, silver-white, with a tinge of copper-red. Occurs massive, dendritic, reticulated, stalactical, and crystallized in tubes and octahedrons. Luster, metallic. Brittle. Fracture, conchoidal. Yields with difficulty to the knife. Specific gravity = 6.33 to 7.30.

Chemical Characters.—In the flame of a candle it emits the garlic odor and turns black. Melted with borax, gives a blue glass.

Composition.—Cobalt, arsenic and sulphur.

To prepare Zaffree.—Break the ore with hammers into pieces about the size of a hen's egg. Pound the mineral in stamping-mills and sift. Wash, and then put into a large flat bottomed arched furnace, where the flame of the wood is made to play upon it. Stir often. The vapor is conveyed through a long flue, in which it is condensed. When the fumes cease, the ore is removed and reduced to powder, and again exposed to heat. It is then reduced to powder and sifted. This is the oxyd of cobalt. It is, however, commonly adulterated with three times its weight of powdered flints, moistened with water.

To prepare Smalt.—Mix the pure zaffree with equal parts of potashes and sand. Heat it in large pots for ten or twelve hours, and frequently stir. Take it out in ladles and drop into water. Then pound, sift and grind.

13.—**NICKEL**.—The ore from which this metal is obtained is Arsenical Nickel. (Kupfer or Copper Nickel).

Geognostic Situation.—Accompanies cobalt. Secondary rocks.

Extraction.—Roast well the ore. The greener the calc proves, the more it abounds in the metal. Fuse the roasted ore in an open crucible, with twice or thrice its weight of black flux, and the whole cover with salt. Expose it to the strongest heat of a forge fire, and the nickel will be obtained. It then generally contains a little arsenic and cobalt. To free it from the first, re-roast it; and from the second, by pouring ammonia into a saturated solution of the roasted ore in nitric acid. Filter, and the gray powder remaining is the nickel.

External Characters.—Color, copper-red. Tarnishes. Occurs massive, reticulated and botryoidal. Luster, metallic. Yields with difficulty to the knife. Specific gravity = 6.60 to 7.70.

Chemical Characters.—Gives out garlic odor when heated. Forms a green solution in aquafortis.

Composition.—Nickel, arsenic, iron, lead, sulphur and cobalt.

[To be continued.]

Chess.—The great European chess player, Rolisch, has challenged the invincible Morphy to play for a stake of \$5000, either in England or New York.

Farming in British Columbia.

THE industry of British Columbia at this moment is almost entirely absorbed by three classes: the miners, traders and carriers. Nothing is heard but Cariboo mines. Everybody is either going there to mine, trade or pack merchandise. Such is a very natural consequence of the glowing, yet, we believe, truthful accounts of the rich gold fields of the Northern mines. It strikes us, however, that many overlook other equally advantageous modes of expending their industry. Farming, for instance, has scarcely any representatives in British Columbia at the present time. It is not that there is no good land, nor no mild salubrious climate; for both the climate and soil of the southern portion of the province are unsurpassed. The country from Cayoosh to Lytton, up Thompson river, on the branches of Thompson river, on the Similkameen, and in the Okanagan country—all have a genial climate and a fertile soil, where the farmer could locate favorably and be amply rewarded for his industry. From William's Lake northward the climate is much more severe; but even there it is not more so than in the Northern States and Canada. Our miners, most of whom have been raised as farmers, have also spent the early part of their lives in an equally cold country; and most, from personal knowledge and experience, be aware of the fact, that the cold winters of their native country did not interpose any unsurpassable obstacle to the production of a rich harvest.

We can see, therefore, no reason except the all-absorbing desire to make a pile in a season, to induce them to forego the permanent prospective advantages of farming for gold-digging.

The early settlers of California who devoted their attention exclusively to farming were in the end, as a general thing, more prosperous than the miners, who were all excitement to get rich by digging gold. The State drew large supplies from abroad at very high rates, and the home farmer had all the advantages of a market in close proximity to where he produced his crop. British Columbia, in like manner, imports everything. Hay, barley, beans, potatoes, vegetables, flour, pork, mutton, beef, are all drawn from Oregon or California. They reach the mines over difficult trails, and at heavy expense for freight, which causes them to sell higher than what are usually considered starvation prices in other countries. It strikes us as very singular then that so few persons show a disposition to engage in agriculture, notwithstanding the late outcry for cheap land. We see no difficulty at all in raising every agricultural product in the central districts of British Columbia that is imported from Oregon and California. It does seem strange then, that with a duty of ten per cent. in their favor, with a freight of eight to twenty cents per pound also in their favor, that some enterprising parties have not taken advantage of the pre-emption laws of British Columbia, and attempted to supply the local demand for agricultural produce.

The few who have engaged in agriculture in the interior, report having done well. And if they only gain the difference per pound in the cost of transportation between New Westminster and the Thompson River country, it ought to be an ample enough profit to enrich the most avaricious farmer.

If Oregon and California farmers can make a profit by shipping their produce to our mines, nothing can be plainer than that any who engage in farming in the Thompson River country ought to make a rapid fortune. Whilst we, therefore, have no wish to dissuade any from going to the Northern mines, we at the same time cannot help directing the attention of immigrants to British Columbia to the fact that farming there offers at present one of the most lucrative pursuits that can be found in any country.—*Colonist*.

New Mining Machines.

THE Hydraulic Press states that French & Co., of North San Juan, are perfecting a new tunneling machine, which practical miners think will prove a success. It retains the hand drill principle, making machinery, with water or steam power, do the labor of man, and effecting a saving in time and labor of two or three hundred per cent. The machine is meant to follow up a tunnel, on a truck. The drill can be worked straightforward, and at any angle, and if directed by manual force, can be made by one man to do the work of three.

The Columbia Times describes some new gold mining machinery lately put in operation by one Bonnel. The principle on which it works is precisely similar to that of a dredging machine. The dirt is washed down by a hydraulic into a deep pit, from which the iron buckets fastened on to an endless chain, set in motion by a steam engine, lift both the dirt and water to the sluices, some thirty feet above. The application of such a machine to mining operations will be found of infinite service where the claims are deep, and it is impossible to cut a deep tail-race.

SILVER MINING.—The Zapata Company, on the San Gabriel river, are hard at work, taking out plenty of good metal. They have arastras at work, and are about to erect twelve additional ones. The business will be prosecuted with energy, and the resources of the vein and its capacity fully developed. At present it presents a surface about a foot broad.—*Los Angeles Star*.

ACCORDING to the census returns, California has a surface of 188,981 square miles, which give 120,947,800 acres, and a population of 384,770. Our population, however, is generally considered to be nearer to 500,000, the census having been badly taken.

PROSPECTING *

Prospecting a River Bar.

The prospector for gold should be familiar with the general principles of the distribution of gold.

Rich gold diggings are found only in districts where granite, quartz and slate exists together; but they may sometimes not appear on the surface of the ground, or even in the beds of the streams. If, however, a thorough geological examination proves that none of them approach the surface within fifteen or twenty miles, then it is useless to search for paying placers. All the rich auriferous districts are hilly or mountainous; have reddish earth with numerous quartz pebbles and pieces of slate among the gravel.

The main implement used in prospecting is a pan made of stiff tin or sheet iron, with a flat bottom from ten to fourteen inches across, and sides from four to six inches high, rising at an angle varying from thirty to sixty degrees.

The prospector having found the district supposed to be auriferous, should go in a season of low water, to some large stream where it emerges from a deep gorge, not far below which he will find a bar—a collection of sand. If the stream makes a turn on emerging from the gorge, there will be at high water an eddy on the side toward which it turns, and in that eddy the auriferous sand, if any, will be deposited. The prospector should go with shovel pick, pan and knife, or spoon, to this bar, where he should dig down in a place where the sand is at least two feet deep, and as near to the water's edge as he can go, without any water in his hole when he gets to the bed-rock. From the bottom he should fill his pan with dirt, taking care to scrape the dirt from the rock, and especially to clean up any crevices that may be in the rock. When his pan is nearly full of dirt he should take it to the water's edge, put it under the water, and then put his hand down into the dirt on all sides and raise it up, so as to have the water pervade the whole mass. If there be any pieces of clay he should break them up and rub them in his hands until they are completely dissolved. Then taking hold of the pan on each side, keeping it under water, with the edge near him a little higher than the outer edge, he commences shaking the pan from side to side. The thick muddy water flows out and its place is supplied by other water which finally carries away all the mud; but before the muddy water is gone the light sand comes to the top, and flows out over the outer edge of the pan, which gradually gets a higher inclination and is raised out of the water, until at length only a few stones are left. The largest of these are scratched with the fingers, and the shaking commences again, and presently all the earthy and stony particles are gone, and then the prospector may look for particles of gold. If he can find none on such a bar, he can say pretty safely that there is no gold in the basin of that river above the place where he has prospected. If the prospector have no one to show him how to use the pan, it may be well for him to practice beforehand, putting some rough little pieces of lead, not round shot, for they will roll out too easily, into the pan with some dirt, and when he can pan out, so as to get rid of all the dirt and save every piece of lead, he will have skill enough for ordinary purposes. Men practiced in the use of the pan sometimes give it a circular motion, so that the dirt runs round and round in it, thus dissolving the clay and throwing out the light material more rapidly than by simple shaking from side to side. It is not difficult to learn both methods of panning. The pan should be free from grease, the presence of which interferes greatly with all the processes for separating gold from earthy matter.

The gold is generally found imbedded in a stiff clay, mixed with gravel and stones. The object of the prospector is to dissolve the clay thoroughly, and to set the gold free, make a current of water to carry away the dissolved clay, and then to separate the metal from the stone by an agitation sufficient to throw out the lighter material, but not sufficient to throw out the gold. In panning, as in all methods of placer mining, the miner separates the gold from the dirt and stones chiefly by making use of the superior specific gravity of the metal.

Prospecting in a Ravine.

If the dirt in the bar should prove rich, it is to be presumed that there are rich ravines not far distant. If the gold be very coarse, it may have come, not down the river, but from a ravine emptying into the river some distance above.

The best time to prospect gullies is during a rain or soon after it, when streams of water are found even in short channels. The prospector should find a place where a vein of slate, with strata nearly upright, crosses the gully. If such a vein can be discovered at a spot nearly level, but just below a steep part of the gully, so much the better, for the gold does not like to stop in precipitous places. The prospector now fills his pan with dirt from the bed-rock at the centre of the ravine, digging up some of the slate, if it be loose, and putting that into his pan too. He then makes a little dam in the ravine, and pans out into the standing water. I have said that the prospector should seek a vein of slate, with strata nearly upright, crossing the gully. If the strata be horizontal, they will present a smooth surface to the gold, which will slip over and go to some place below; whereas, if the strata be upright, the bed of the gully will be rough, and full of crevices, in which the gold, when once lodged, will be safe against the fury of any current.

Auriferous ravines and gullies differ greatly in wealth, even though very near each other; the different parts of the same ravine differ also. The thorough examination of a

large district of ravines, therefore, requires much labor. The reason why I recommend prospecting in ravines immediately after a rain is, because every little gully then has water for washing, and also because the dirt is easy to dig, and being filled with water is so much more easily washed.

Prospecting with a Knife.

It might occur, however, that a person would wish to prospect in a very dry season, in a place without water for washing. In such a case he should select a spot in a gully by the rules indicated in the last paragraph, dig away the earth to very near the rock, and then get down into the hole and scratch the earth over carefully with the point of a knife, picking out the particles of gold and throwing away everything else. He should be very particular to scrape out cleanly all the crevices in the rock, and if the rock be slate, he should dig up some of it slowly and carefully, examining all the seams for gold, which enters such places in a manner often very puzzling to the miner. In rich diggings, men not only prospect in this method, but work regularly at mining.

Prospecting a Flat.

To prospect a flat, the miner should seek for signs of the place where the water ran before the earth was deposited; for every flat has a deposit of earth upon it, usually not less than six feet deep and sometimes as deep as a hundred feet. It frequently happens that the course of a brook on the surface of the flat indicates the position of an ancient brook lower down. The miner then should start in the bed of the surface brook, and dig a hole or shaft to the bed-rock and try the dirt there. Nobody should undertake to prospect for deep diggings, whether in flats or hills, save in a district known to be auriferous. If gold cannot be found near the surface, there will be little encouragement for going deep. It is difficult to lay down rules in regard to prospecting for deep diggings. In many cases in California they have been discovered by accident. It has also frequently happened that miners at work in a little gully running from a flat or hill-side, have followed up a rich lead of placer gold until it took them into a class of diggings entirely different from that in which they started.

In an auriferous district where there are high hills of gravel the miner should keep his eyes on them. Such hills often contain great deposits of golden wealth. The best places to examine these hills are where the streams have cut down through them, exposing steep banks on each side. If distinct layers of clay and gravel be visible in the bluff, the prospector should try them all in his pan.

Prospecting for Quartz.

Prospecting for quartz is entirely different from prospecting for placer diggings. Most of the auriferous quartz is found in veins running north-north-west and south-south-east, at an elevation from two to six thousand feet above the level of the sea. The prospector for quartz, looks at every vein where it crops out on the side of a hill or in the bank of a stream, and if he cannot see any particles of gold, he usually infers that the rock is not auriferous.

Rich quartz veins are often found by accident. In Tuolumne county, in October, 1858, a miner shot a grizzly bear, on the side of a high and steep hill. The animal rolled down the hill until it came to a projecting rock, upon which it lodged. The miner went down to his game, and as he was skinning it he saw gold in the rock, which proved on examination to be very rich.

In May, 1855, a Mexican highwayman attacked a miner near Coulterville, Mariposa county, and after firing several shots on both sides, the assailant was killed. The fight occurred in a ravine, and just after firing a shot which missed its aim, the miner saw a glitter of reflected sunlight from a rock where his ball had struck. So soon as the highwayman was dead, he went to the spot struck by his ball, and there found a rich vein of gold-bearing quartz.

The Alison vein, in Nevada county, reported to be the richest quartz mine in the State, was found by tracing up a rich lead of placer gold to the quartz from which it had come.

Mr. J. E. Clayton, a mining engineer, gave through the columns of the *Mariposa Gazette* the following advice to prospectors of auriferous quartz:

The first step to be taken is to ascertain the direction of the strata of the bed-rocks and quartz veins imbedded therein. Then take a common pick, shovel, and good iron pan, and prospect the surface dirt along, and just under the break of the veins every few yards, thus following the vein as far as it shows itself, either by its outcrop or loose fragments; and if gold is found in the surface along the vein, it is good presumptive evidence that the vein is gold bearing. Then ascertain the point on the vein that gives the best prospect, and make a cut across it deep enough to show the vein as it is enclosed in the bed or wall rock; then make a careful examination of every part of the vein, so as to determine what part of it is gold-bearing. The censing of the vein where it joins the wall rock should be carefully tested also; it frequently occurs that the casing is richer than the vein itself. The best mode of testing the rock is to pound it finely in a hand mortar, and wash it out in a pan or horn-spoon. If a satisfactory result is obtained, then sink a shaft so as to cut the vein at the point where the best prospect is obtained, and follow it down say forty or fifty feet. The character of the wall rock should be closely observed, to ascertain the line of its texture. The smooth faces that separate the vein from the quartz rock should be carefully examined; the smooth faces have numerous small ridges and grooves upon them,

that show the line of its projection, or the direction from which the vein was forced up between the walls enclosing it. The ridges and fine grooves on the faces of the veins will, in most cases, be found to have the same direction of the texture of the wall rock; and the rich section of the vein will most generally continue rich in the line of its projection. It is frequently the case that a vein will have a section of a few feet that will be rich, and all the balance of it be poor; therefore, it is very important to learn the line of its projection, for the rich sections always follow the course indicated by the line of projection and the line of texture of the wall rock.

The Quartz Lodes of Sierra County.

UNTIL within a year or two past—since hydraulic mining has become less profitable than formerly—very little attention was paid to the quartz lodes of Sierra county. True, we have had our quartz excitements; men have grown enthusiastic over mica and sulphurets, mistaking them for gold; and imaginary lodes, worth fabulous sums of money, have for a day enriched the deluded owner. But these excitements, the creations generally of moon-maniacal minds, have gone down about as suddenly as they came up; and so frequent and sudden have been the transitions from poverty to wealth, and from wealth to poverty again, that people, capitalists as well as working men, have been quite indifferent concerning quartz mining in this county, dreading it with a fear akin to what the farmer in the West used to feel in regard to the wild cat banks of that country. A better state of things now exists among us. In the southern and middle parts of this county, the richest quartz mines are now being worked; and this branch of mining is proving one of the most remunerative in Sierra. At the Buttes, at Hogg's Cañon, and other quartz regions, the mills are crushing large quantities of rock, and the weekly yield of gold would astonish those not familiar with the richness of the lodes in our county.

Northern Sierra has not as yet proved itself very rich in a wealth of quartz; for the reason, perhaps, that hydraulic and drift mining have been found so profitable that it was deemed inexpedient to risk money and labor in a branch of mining about which little was known. Quartz-bearing rock, some of it very rich, has been found throughout the northern part of this county, most frequently in the vicinity of gold-bearing gravel. We have frequently heard experienced miners remark that this part of the county contained rich and extensive lodes of auriferous quartz; that it only required capital to open them, and that the day would soon come when this would be counted among the most profitable quartz-yielding counties in the State.

The placer diggings of Sierra county are nearly, if not quite, worked out; the miner no longer makes his fortune in a few months, with long-tom or rocker; and in most instances he fails to obtain wages by a Chinese process of working the mines. The best diggings in this part of the county, both hydraulic and tunnel, are owned by wealthy and extensive companies, and few, save capitalists, are realizing much money from our diggings. It therefore becomes necessary to thoroughly prospect our mountains, and knowing, as most of us do, that gold-bearing quartz has been found in Sierra North, why not follow up old discoveries, prove them, and search diligently for new ones? Quartz prospecting, it is true, is very expensive, requiring much labor and great expenditure of money; but the amounts annually spent in running bed-rock tunnels, often ruinous to those engaged in this precarious business, and the expenditures of money for water to wash away immense banks of worthless gravel, would effectually prospect the greater part of the ledges supposed to exist in Sierra county. We would like to see the experiment tried; and we have little doubt of its resulting favorably to those who engage in it.

This article has been suggested by a report which has just reached this town, that in Sol Wood's tunnel, at Four Hills, exceedingly rich quartz was recently found. Woods, it will be remembered by a few, commenced the running of a tunnel at Four Hills, a long time ago, having a number of Mexicans employed. Many people considered his project a wild one, there being no strong evidence that auriferous quartz existed in that part of the county. But the prospector persevered in his work, struck the vein, and is now the possessor, it is thought, of claims among the richest in Sierra county. Who can doubt that other veins, even richer than the one at Four Hills, are but waiting the approach of the energetic prospector?

A NEW AND RICH LODE.—The mining company known as Dan Collins & Co., composed of Dan Collins, Dave Collier, George Baldwin and Henry Brainard, have recently discovered, on Gold Flat, in the immediate vicinity of Nevada, a very rich lode of decomposed quartz, which they have christened "Gold Ledge," and which is situated very near Wentworth's sawmill. The quartz has been tested by the assayer and found to yield \$51 25 to the ton. The specimens submitted to the test were taken, indiscriminately from the top of the lode to the depth of sixteen feet. The lode is from eight to ten inches in thickness, and appears to increase in richness as it descends. It is now partially developed to the depth of forty feet. The discovery of it was an accident—by a pipeman carelessly washing away some earth that he thought ought to be removed; for, like all other lodes in and about this city, it lay considerably beneath the surface of the ground.—*Transcript*.

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY JUNE 1, 1861

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

California Railroads.

WE never could understand why capitalists have been so extremely careful as to embarking in railroad enterprise in California. For a long time no move at all was made in that direction—probably because they entertained the idea that the mines of this State would soon cease yielding golden tribute to the delver, and that then such investments would turn out ruinously to the stockholders. But this is an exploded notion; for year after year exhibits greater and greater developments of minerals. The placer mines are to be sure, nothing in comparison to what they have been; but we now have what is far better, viz., deep bill gold diggings, extensive ariferous quartz mines, and vast silver and copper, and coal and cinnabar veins, which are now being worked, and which will last for ages, enabling California to maintain her proud position as the world's great Fountain of Wealth, even when our children's children are dead and gone. This being so self-evident, the great future of our State is behind all cavil, and therefore the reason for backwardness in such ventures does not exist, or is at least, unfounded. Strange that we did not wake up to the truth before! Strange, that Australia has taken the wind completely out of our sails in this respect. A system of railroads for Australia was one of the first matters that engaged the attention of capitalists in that and the mother country; while those of this country hesitated and waited for years before they could be induced to go into quite a small railroad speculation. But we are glad to see the monied people at last waking up to the necessity of having them, and perceiving the safety and great profit of the investment. Let us glance at what has been and is being done in this class of enterprise:

A few years ago some enterprising gentleman formed the first Railroad Company in California. At that time laborer's wages were much higher than now, and it was at great expense they constructed and placed in running order the Sacramento Valley Railroad. In two years (if memory serves us) the freight and passage money, earned more than the original cost of the road, etc.! The enterprise paid immensely, and their road is now being pushed onward from Folsom to Auburn. A company, too, has recently been formed at Nevada to connect that flourishing central point of the Northern mines with the Sacramento Valley Railroad, and we believe competent persons are already engaged in constructing the line. The contemplated Marysville and Benicia Railroad is, we are told, fast approaching completion; and that between San Francisco and San Jose, which it is supposed will one day form a link in the great American transcontinental railroad, will soon be commenced, as the counties of San Francisco, San Mateo and Santa Clara, through which it is destined to pass, have decided to take a large amount of stock, so as to give greater confidence in the undertaking and facilitate the company's operations. Some three or four miles of this railroad between San Francisco and the Willows, which has been in running order for about a year, has proved largely remunerative, and soon we are to have a network of railroads throughout our city. We observe, too, that the papers of Placerville are urging the people to take stock in a railroad between that thriving city and Folsom. They evidently see that if this is not done, Nevada will soon be the point of departure for the Washoe and adjacent silver mines, instead of Placerville. In an article upon the subject, the *Central Californian*, published in Placerville says:

There is money enough in the hands of property-holders alone, in this city to build the railroad from Folsom to the point designated for the depot near this city, and certainly the investment would pay upon any amount laid out in stock. We cannot think our citizens intend to allow themselves to be deterred from this grand work until the laurel has been wrested from their grasp by our more active and energetic neighbors in the north part of the State. But it is not required that all the money necessary for the commencement should be raised in this city and county; there are many men possessing large amounts of money, looking about them to discover a safe and profitable place to invest, and would only be too glad of an opportunity to invest \$10,000, \$20,000, or \$50,000 in stock in this road, if they could see the thing going on under proper management. We conversed with a number

of gentlemen in San Francisco last week, who inquired anxiously about what the people here were doing for a railroad to Placerville, and expressed a desire to take stock, and said to us that \$500,000 or more of stock could be sold in San Francisco. The S. V. R. R. Company also would be glad to enter into this project and the moment it is put properly in motion will materially aid in its advancement.

It will be seen that California railroad projects are becoming comparatively numerous, but are only local speculations, which, however, may some day form parts of one grand system which shall embrace not only California, but Oregon, Washington Territory and British Columbia on the north; Lower California, Mexico and Central America on the south; and Nevada, Utah and other territories, Middle and Atlantic States on our East. With a vast network of railroads like this, centering in San Francisco, to how proud an eminence would rise our State! and our busy, energetic city would more than ever deserve to be called the Emporium of the Pacific. If, then, we love our State and love our city, and love our own pockets, let us by all means foster railroads in California.

Important to Fruit Growers.

THE last Legislature authorized the Governor to appoint Commissioners to visit Europe and report upon the grape and other fruit culture &c., but made no provision for the expenses! The Governor has appointed Col. Haraszthy—a man of large experience in all such matters, and who wields a "practised pen," as one of commission, and he makes the following excellent proposition:

Each person paying twenty-five dollars shall receive twenty-five varieties of choice vines; two cuttings of each amongst them shall be the seedless Sultanina raisin, the currant, the celebrated Madeira and Mammoth Palatine; two paper shell Almonds, one of Smyrna and the other of Italy; two oranges of choice variety, two lemons, two olives, two figs, two large Italian chestnuts, two pomegranates, and a bound volume of the report, which will contain full instructions or the making and fermenting of wine, as it is done in the different countries, also the manner in which Champagne and Cognac brandy is made, showing the mode of curing and packing raisins, figs and currants, picking olives, making olive oil, drying and curing the celebrated Mecklinburgh fruit, preserving grapes and other fruits in cans, also giving statistics of the wine produced by every grape growing country, the amount received for the produce exported, consumption, revenue, cost per acre for planting, cultivating and making the wine, accompanied by lithographs, showing the machinery, &c. This book will not fall short of about six hundred pages, and may contain more. It will be very valuable to every person cultivating the above mentioned produce.

Persons paying fifty dollars will receive sixty varieties of vines, two of grape, five almonds, five olives, five lemons, five oranges, five figs, five chestnuts (each of the above number will be a different variety, wherever so many varieties exist), two pomegranates, and a bound volume of the report. Persons paying one hundred dollars will receive one hundred and fifty varieties of grape, two cuttings of each variety, two fruit trees of every variety of almond, olive, orange, lemon, chestnut, fig, pomegranate, and a bound volume of the report. Persons whose soil and climate are not suited to the culture of the grape, can have in proportion to their subscription, such fruit trees as they can cultivate. Persons subscribing five hundred dollars, will receive two cuttings of every variety of grape now in cultivation in the civilized world (eleven hundred are known now), and two trees of every variety of olive, orange, lemon, pomegranate, almond, fig, &c., with a bound volume of the report. It would be advisable for farmers and nursery-men to club together and subscribe five hundred dollars; in this manner they can get every variety of both grape and fig tree. By propagating the same, they would possess every species of tree and grape now known in Europe.

The Commissioner's intention is to visit France, Portugal, Germany, Hungary, Italy, Greece, Smyrna, and Egypt, and make purchases there of vines and trees. Persons can subscribe for any share named above, at Wells, Fargo & Co.'s offices throughout the State, and will receive a receipt for the sum, signed by the Commissioner.

ANOTHER CALIFORNIA INVENTION.—The attention of our readers is directed to the engraving and description, on the first page, a valuable California invention—the "Union Projectile"—which seems to possess very great merit, and may be of service to the Government in the present much-to-be-regretted civil war.

GRAND FESTIVAL.—On next Sunday, Monday and Tuesday, a grand "Ladies' Festival" will be given at the Willows—the most charming and popular place of resort in our suburbs—for the benefit of the Church of Notre Dame des Victoires, which is deeply in debt. The programme eclipses any ever given to the San Francisco public. See advertising columns.

EARTHQUAKE.—The shock of an earthquake was felt at Downsville, one day last week.

The Mount Diablo Coal Mines.

We have recently visited the coal mines of Contra Costa county, says the *Times*, and confess ourselves astonished at the vast extent of the deposits which they contain, and at the facility with which the coal can be brought to market. Much has been spoken and written of this coal region, but its importance to the State as a source of wealth and an adjunct to its prosperity, has been but inadequately described. We will not say that the supply of fuel which may be obtained from these beds is inexhaustible, for we know how flippantly that term is frequently used, but we think that one may safely affirm that for a generation to come the district in which veins have already been opened will furnish a quantity ample for all the necessities of the State.

The present route of travel to the mines is through Martinez, the shire town of Contra Costa county, Pacheco, and a pretty site for a village at the foot of the hills. The pass through which it winds is neither a valley nor a cañon, but a gentle depression among green and softly rounded hills, that make a beautiful landscape for the eye of the traveler. At the summit of the pass a grand view of the valleys of the San Joaquin and the Sacramento breaks upon the sight, which is worth the journey to witness.

The coal mines lie on the northern side of the ridge, with the exception of the Peacock vein, owned by Pioche, Bayerque, & Co. The work done on the Peacock was commenced so injudiciously, that it is not easy to determine whether the vein is worth following or not.

The first opening at the great seam or bed the on northern side consists of the works of the Cumberland Company. It is fair to presume that the whole quarter section of land belonging to the company is underlain by the coal bed upon which they are at work. This mine is operated with a skill, system and efficiency which reflect credit upon Mr. Cutler, the resident manager and one of the owners. The property is divided into four shares, which are subdivided into smaller fractions. The last sale of one-eighth showed that the value had risen within the year from \$32,000 to \$100,000 for the whole. A drift of about five hundred feet has been run horizontally into a hill 1300 feet high, two hundred and fifteen feet below its summit. This drift runs through a seam of coal four feet thick. The dip of the vein is twenty-two degrees towards the southwest, and two degrees towards the east. From the main drift, or adit, lateral tunnels have been run at intervals of thirty feet, following the inclination of the bed toward the top of the hill. As the coal is loosened with the pick or by blasting in these tunnels, it runs down the inclined plane of the stratum to the main drift, where it is received in a car and run out to the mouth of the mine. Many thousands tons yet remain on the upper side of this drift, but for the greater facility of working, another adit has been run into the hill, 200 feet lower down, from which the bed will be worked upward. The floor and the roof are of slate rock. For a part of the distance, however, stooping is necessary, and it is done by the miners, who get out the coal at a certain price per ton. The timber is supplied to them by the company. The quantity now sent to market each day from this mine is twenty-five tons. It is drawn to the place of embarkation for water carriage in wagons, at an expense of two dollars and fifty cents a ton.

The contract under which this price for the land transportation is paid will terminate on the 1st of June, when a reduction is expected. In the same hill, a quarter of a mile to the southeast, lies the Black Diamond vein. The company owning this property has just completed an expensive road to the bay, and they began to deliver coal on the 15th. This vein supplies the most brilliant and clear mineral yet discovered in this range. It is taken out in great masses unadulterated with sulphur or other extraneous materials.

Traversing the face of the ridge for three miles, we found four companies at work, two of which are sending to market twenty tons a day each. In none of these veins has water been found, but a German company engaged in sinking a perpendicular shaft, at a low level, expecting to strike the coal at a depth of five hundred feet, has come to water one hundred and fifteen feet from the surface. Their plan is a bad one, for if they are certain to reach the coal, the expense of raising it so great a distance and keeping their levels free from water, will certainly be more than double what the other companies will be able to sell for. It is therefore evident that the inexperience of these gentlemen will cause the loss of their investment.

The quantity of coal consumed in California last year was 80,000 tons, of which 72,000 was imported. The whole quantity can be furnished from the little tract within which valuable workable veins have already been discovered. But the demand and consumption will increase indefinitely, so that there is no danger of a glut in the market. The present price of Mount Diablo coal is about \$12 a ton.

TEACHERS' INSTITUTE.—The State Institute of Teachers has been in session for several days past, in this city, the Hon. Andrew J. Moulder, State Superintendent of Public Instruction, presiding. Its annual labors will doubtless greatly benefit the members, and through them the Public Schools throughout the State.

SEVERE ACCIDENT.—We regret having to chronicle the fact that Mr. Donahue, proprietor of the Union Foundry, last Wednesday met with a severe accident—a heavy casting fell against his right leg, and fractured it.

SUMMARY OF MINING NEWS.

CALIFORNIA.

Sierra County.—From the La Porte Messenger, of the 25th, we receive some interesting items: At Gibsonville, the Delahanty, Pennell, Fisher, Walton & Co., Holoken, and the Tabor Claims, now owned Steel, are being worked with encouraging success. The tunnel miners Gibsonville are paying well—some of them even yielding better than in other years; while hydraulic diggings continue to be a source of profit to the engaged in them. At Mount Pleasant, the Union and Keystone, or three former are in rich gravel, and are proving immensely profitable to their shareholders. Gravel Hill tunnel is in 1,200 feet—working thirteen men, and two boats; cleaned up, on Saturday, after one week's run, 47 pieces; these diggings are averaging \$14 per day to the hand. The Mount Pleasant tunnel, which has attained a length of 1,600 feet, has fifteen hands employed; these diggings formerly paid \$12 per day to the hand, and will, it is thought, be found even richer at the next cleanup. The Levi Day mine is said to be yielding well. The Union and Keystone tunnels are progressing towards pay dirt. At Whiskey Diggins the Gem Tunnel, working thirty-five men, is paying splendidly; for four days' run, last week, the company took out \$1,600, without cleaning the ground sluice. The claims, it is estimated, will average \$4,000 a week. The North America, 900 feet long, has between sixteen and twenty hands at work, and is working three pieces. The first gravel wash is being sprung (principally gangway dirt) and \$1,000. The Reading Tunnel is abandoned. The Union and Keystone Co. will have a first-rate thing when their tunnel is completed. The Bonanza and Antilla tunnel (owned by Dr. Porter, Oliver Stewart, and S. H. Lyness) is in 900 feet—four breasts, four men in each, are being worked; these claims have averaged, with the labor of twelve men, for the last five or six months, 70 ounces a week. For one day's washing, Tuesday last, the amount of 21 ounces and 14 dollars was taken out. The first washing took place in July last, and, according to the cash book, the amount of gold yielded from that time to the present has been nearly \$28,000. These claims are only worked in the day time. The New York tunnel, the first opened at Whiskey Diggins, has fifteen men at work, and continues to pay well. The gravel taken from the main tunnel, pays \$12 per day to the laborer; and the drift dirt will be found richer. From gravel taken out during the month of winter, and washed not long ago, \$10,000 was obtained, five hundred feet of tunnel was cleaned, and the claims of William Gilson and John H. Smith, who are working the claims, are said to be yielding from that time to the present has been nearly \$28,000. These claims are only worked in the day time. The New York tunnel, the first opened at Whiskey Diggins, has fifteen men at work, and continues to pay well. The gravel taken from the main tunnel, pays \$12 per day to the laborer; and the drift dirt will be found richer. From gravel taken out during the month of winter, and washed not long ago, \$10,000 was obtained, five hundred feet of tunnel was cleaned, and the claims of William Gilson and John H. Smith, who are working the claims, are said to be yielding from that time to the present has been nearly \$28,000. These claims are only worked in the day time.

San Bernardino County.—Mr. John Morrison writes to the Mariposa Gazette, from Bear Valley, San Bernardino, as follows: So far as I am acquainted, judging after three or four days' prospecting, and from general indications, there is nothing here to justify the celebrity of these mines. They are situated in a high range of mountains, surrounded by plains or forests of oak and alder, but inaccessible for wagons or pack trains. The placer diggings are very level, and covered with coarse granite sand. The pay strata is about three feet thick and covered with water, which, owing to the levelness of the mining region, renders the working of them almost an impossibility. The few claims that are being worked at present pay, as I am informed, from two to twenty dollars per day; but the twenty dollar claims are scarce. Quartz veins are very irregular and undefined. The largest, and said to be the best yet discovered, is the Mammoth vein; but the strata of rock is so narrow that it would never justify the expense of heavy machinery. Some fifteen arrastres are now running, being worked mostly by Mexicans. All attempts at silver mining were unsuccessful.

Napa County.—Several tunnels are being run into the Napa quicksilver ledge, and good strikes are confidently expected.

Calaveras County.—From present indications, during the coming summer and autumn, says the San Andres Independent, from 400 to 500 men will be employed on the Copper Canon and other veins, either in Salt Spring Valley or close upon its rim. Every week, prospecting parties are leaving the neighborhood of Angels' and this place for the new district. In search of new mines, and every day the stock in the mines already developed is increasing in value. A fortnight since, a tunnel in the San Andres Canon was sold for \$2,000, and a few days ago we were informed that another claim in the same lead, for a similar interest, declined taking \$5,000. On the whole, we think the copper district of Calaveras will, in a few months, contain the most prosperous and wealthy community in the mines.

Placer County.—The Placer Courier says that "the India-rubber claims, at the Gardens," near town, (Forest City) are yielding handsomely just now. A nugget of ninety-three ounces, fully of which was pure gold, was found on last Saturday. Since then several smaller ones have been found. On Wednesday last, says the same paper, we descended to the "lower region" of the truly gigantic mines never before in Forest Hill known as Independence Slope. The extremity of the tunnel where the workmen are now engaged, is five hundred and forty-three feet from the level of the town—and the bed rock is still "pitching." There is every indication of the existence of an old channel under Devil's Canon—and the enterprising owners are sanguine of striking something rich before a great while. Although the pay dirt is not very rich yet, still the prospects are by no means discouraging. On Saturday last, a piece of "sheet gold," weighing five dollars, was found. Cobble-stones, sand, gravel, cement, and roots of trees, all go to show the existence of an old channel at that side of the mountain, which, if it should turn out rich, will open an extent of mining ground exceeding anything ever before heard of in California. And Forest Hill will then be the mountain city of California.

Tulare County.—From a correspondent of the Visalia Sun, we learn that at Keyville, in consequence of high water, caused by the melting of the snows, all the quartz mills have been stopped; also, many of the arrastres—but will perhaps be in full blast again about the middle of June. Says he: "On the various leads now being worked, there is some very good rock being taken out, which is set down at one hundred dollars per ton—most likely it will pay much better. Messrs. Bathorn & Bonnet have just discovered a vein in the vicinity of the old Pioneer lead, from which they are taking out some very good rock. At Dutch Flat, Dr. de la Corde, from several leads, is getting out some very good flat. He now has over two hundred tons out, all of which will pay well. Some quartz recently ground in Mr. Caldwell's arrastre paid ten dollars per ton. At Greenhorn Gulch some quartz ground at J. W. Freeman's mill yielded seventy-nine dollars and fifty cents per ton. Parties in that vicinity are getting out good rock. Marsh & Co.'s mill, on Little Posey, is now at work crushing rock for other parties, which is said to be very rich. Some placer miners there have been making four ounces per day to the hand, for some time. One man has made \$4,000. A friend of ours, says the same paper, has sent us a few specimens of gold discovered in the mountains in the vicinity of the mountains. A portion of the country, which slightly lay over anything we have yet seen in Tulare county. The rock is perfectly interlaced with threads of gold, but its great value (judging from the estimation of a practical quartz miner, consists in the total absence of sulphur of iron, antimony, and other metals with which the quartz in this section is so generally impregnated, and which, by coating both the gold and mercury, render it almost impossible to save all the former by any known method of amalgamation. The specimens before us contain nothing but pure quartz and gold.

Sonoma County.—A correspondent of the Sonoma Journal says of the St. Helena quicksilver mines, in that county: "These are three companies in this district (the Tuscara, Dead Broke, and Apostolic) now actively engaged in prospecting their claims. The miners generally have great confidence in the richness of the mines. The Tuscara Company have a fine prospect at the surface. They have struck a vein of cinnabar, which, it is estimated, will yield from 60 to 80 percent. The vein varies from 10 to 16 feet in width, and the cinnabar contains a large quantity of red quicksilver, which is deposited in large cavities in the rock. The company are now running a fine tunnel for the purpose of prospecting their claim. It is already in 160 feet, and they expect to strike the lead at about 200 feet. It is estimated that the tunnel will be from 180 to 200 feet below the surface. The Dead Broke Company have also a good prospect at the surface. They commenced

smelting, on a small scale, last week. I have not yet learned the result of their experiment, but will give it in my next. They are running a tunnel, and are in about 250 feet. They expect to strike the lead at 325 feet. The Apostolic are running a tunnel, and have a very good prospect, and appear very confident of striking it rich when they get in."

Contra Costa County.—We learn from the Martinez Gazette that the fire, which last week raged in the Camberland Coal Mine, was after much exertion, put out. Had a little longer time elapsed before the fire was very little it would have been almost impossible to obtain the mastery, and the loss would have been incalculable. How the fire was kindled remains a mystery, but it is supposed to have been the work of incendiaries.

NEVADA TERRITORY.

Virginia City.—The Ophir Company, says the Territorial Enterprise, are now beginning to realize some returns from their heavy investments. The machinery at their immense works in Washoe Valley is working admirably. The lead of the company is improving the deeper they sink upon it. The company, it is thought, will receive during this month from seventy to eighty thousand dollars from their works. The Spanish Company struck a pocket in their vein, this week, about six feet in length and eight inches in width, which contained almost pure silver. They are now doing an excellent paying business. Chinatown has rapidly improved during the past two weeks. Parties bound for the Goose Creek and Humboldt mines are passing through there daily. The surface mines there are doing a good business, the average yield to each hand employed being about five dollars per day. Seven companies are now employed at those diggings.

The Flawery District.—This district, says the Enterprise, which is a suburb of Virginia, is rapidly improving. The different mining companies in that section are prospecting their works with vigor. The Adriatic Company have entered into a contract with Mr. Maldonado to work their mine for six months. He is now engaged in taking out rock from the ledge, which is well defined and about four feet in width. Men capable of judging the Adriatic ledge, when developed, will prove second to none in the Territory. The Flawery Company have been steadily working at their claim for the past time months, and have recently struck it in their lower tunnel, after running 220 feet. The ledge from seven to fifteen feet in width, and promises to be rich. A company, towards the Adair tunnel, which is located the Adriatic, Cade San, St. Lawrence, Pine and other leads. They intend to run entirely through the hill to a ravine on the east side of it, thoroughly ventilating and testing a whole mountain of mineral by so doing.

A correspondent of the Bulletin, writing May 23d, says: The Adriatic Company ledge are taking out some excellent paying rock, said to yield from \$300 to \$500 to the ton; but, of course, this is a mere guess. However, it is a rich claim, and so far as developed promises well. Of this rock there were some five tons sent to San Francisco two or three weeks ago, the returns of which show a yield of \$1200 to the ton; but this shipment was doubtless choice selected rock. . . . On his way thither he noticed a new steam mill, with Cornish crushers, in course of erection for the Rogers Company; and a quarter of a mile below he saw workmen building Brook's new power pump mill; also, at the village, Mr. Knox was erecting a steam mill with sixteen stamps.

Buena Vista.—Three large tunnel companies have lately been organized to run tunnels into hills known to be rich in silver and gold. It is reported that a rich deposit of cinnabar has been discovered six miles southwest of Mono. Aurora, the chief town of the Esmeralda district, is rapidly growing. The present population is about 600.

BRITISH COLUMBIA.

The Victoria Press of recent date says: The Otter brought down about 20 Chinamen on their way to California from the Similkameen. They report a great deal of snow at the mines—altogether too much for their comfort, and are accordingly retracing their steps to a more genial climate. She also reports that the same ten or twelve others, prospectors, and about \$23,000 or \$24,000 by express, besides a large amount in private hands. C. C. Young arrived by the Otter, and brought down numerous rich specimens of silver ore from the Harrison-Lillooet mines. The leads are said to be both extensive and highly silver-bearing. . . . Business is steadily improving in the up-river towns and pack trains are arriving daily for their second cargo for the mines. The receipts of gold dust are fast increasing, and the utmost confidence is manifested that there will be an extraordinary yield during the present season. . . . Mining news from the Cariboo region continue to be favorable.

From the Colinet we learn an exploring party from H. M. S. Heate is said to have struck very rich veins of copper on the island between Barclay Sound and Nanaimo. The party (as the story is given us) started some time ago to explore the interior of the island, leaving the coast at Barclay Sound, and striking the coast again at Nanaimo. In crossing some fine prairie lands pieces of copper were picked up; and upon a further examination, being made, it was ascertained that the country abounded with like specimens. Several large veins of great richness are reported to have been struck. Whether true or false, we have no means at present of ascertaining, and so merely give the statement as it comes to us.

In the same paper we extract from a private letter, lately received from Doctus, as follows: At Cayash, they have found extensive diggings. The pay dirt is about ten cents to twenty cents. One of the upper country packers has got down from Cariboo, and confirms the reports already published in the British Colonist. But little dust has got down yet, however no doubt it will be plentiful enough in less than a month. Water has been brought on two bars below Cayash—Texas and Kauchera Bars. The diggings promise well. The ditch is the largest in the colony, and carries 1,200 inches of water. It has cost \$9,700. The company intend to extend the ditch about 14 miles down the river. P. S. & Co.

OREGON.

It is stated that the celebrated Applegate Quartz Lead, near Jacksonville, Oregon, has run out. In April one of the members of the company took out \$20,000, which had been obtained from the mine within a short time.

It appears that at the Dalles there are but few claims opened as yet, and that the lack of materials, and the inclemency of the weather, have done much to impede the development of the diggings.

A gentleman from the Wenatchee mines recently came into the Dalles, bringing with him a large amount of gold dust. He reports that about fifty men are at work on the Wenatchee, and that they are making from \$5 to \$8 per day to the hand.

Within the past week full \$1,000 in Rock Creek dust has been received at the Dalles, says the Mountineer, of the 15th.

The snow still prevents the working of the Nez Percés gold mines. They are said to be extensive and rich.

Iron mines have been discovered in the vicinity of Oswego, Oregon—which are attracting attention.

GENERAL PROGRAMME OF THE LADIES FESTIVAL.

—AT THE—

"WILLOWS,"

June 2d, 3d, and 4th, 1861.

Commencing each day at 11 o'clock a. m., and ending at 6 o'clock, p. m.

Tickets Children above Ten One Dollar

Fifty cents

Giving admission to the Willows, and passage both ways on the Market Street Railway Cars.

MUSICAL PROGRAMME.

FIRST DAY.

Sunday June 2, 1861

Commencing at 1 o'clock, P. M.

Leader of the Orchestra, MR. J. SCHMIDT; Conductor, MR. HEROLD.

Part 1.

1—Willows Festival March, Koppitz; 2—Overture Sirene, Auber; 3—Waltz, Messengers of Spring, Gangl; 4—Pot Pourri, from Rigoletto, Verdi

Part 2.

1—Overture, Oberon, Weber; 2—Polka, Les deux Fauvettes; 3—Pot Pourri from Nabucco, Verdi; 4—Haute Valse Quadrille, Strauss.

Part 3.

1—Overture, Stradella, Flotow; 2—La Plamanda, Polka Mazourka, Musard; 3—Nocturne, Solo for French horn, Lorenz; 4—Garibaldi Gallop, Newman.

VOCAL AND INSTRUMENTAL CONCERT,

By the following Artists:

Mrs. Georgiana Leach, Miss O'Keefe, Miss Griswold, Miss Jennie Mandeville, Mrs. Agatha States, Mr. Leach.

THE TWELVE.

M. Mitchell, Charles C. Bonnet, Georget.

Monday June 3d, 1861

Commencing at 12 o'clock.

Leader of the Orchestra, MR. SCHMIDT; Conductor, MR. HEROLD.

Part 1.

1—Overture—Maritima, Wallace, Orchestra.

2—The Valley of Chamounix, Mrs. Agatha States; 3—The White Squall, Mr. Leach; 4—Welcome Home, Miss O'Keefe; 5—Cradle Song Waltz, Orchestra; 6—Aria; 7—O' lucc di queter, anima—Lindini Chamounix, Mrs. Georgiana Leach; 7—1 Thought of Thee, Miss Jennie Mandeville; 8—Pot Pourri—Huguenots, Orchestra.

Part 2.

1—Overture—Freischütz, Orchestra; 2—Duet—The Syren and Friar, Mrs. and Mr. Leach; 3—Angel's air—Favorita, Mons Charles C; 4—When wilt thou meet me? Miss Jennie Mandeville; 5—Concours Polka, Orchestra; 6—Hi piacer mi balza il cor, Miss O'Keefe; 7—Aria, from Ernani, Miss Agatha States; 8—The merry figure—Pot Pourri, Orchestra.

Part 3.—1—Overture—Scimitaire, Orchestra; 2—Strike of the Lyre, The Twelve; 3—Duet—Gentle sighs there's a path by the river, Mrs. States and Miss Mandeville; 4—Linger in blissful repose, Mons Charles C; 5—Carnival Quadrille, Orchestra; 6—Quartette—The breath of the Briar, Mrs. Leach, Miss Griswold, Mr. Leach and Mr. Mitchell; 7—Merry Zingara, Miss O'Keefe; 8—Les deux Aveugles, M. Bonnet and Georget; 9—Serenade, The Twelve; 10—Grand Finale from Zampa, Orchestra.

Tuesday, June 4; Commencing at 12 o'clock—Leader of the Orchestra, MR. SCHMIDT; conductor, MR. HEROLD.

Part 1.—Overture—Stabat Mater, Orchestra; 2—Pro Penatis—Stabat Mater, Mr. Leach; 3—Chansonnette—De Pandero, Mrs. Georgiana Leach; 4—Robert le fou, Mrs. Agatha States; 5—The day of our Lord, for brass instruments—Soleis, by Messrs Kendall, Bachel, Storr and Smith; 6—Drink! Song—Nachtigall, Miss O'Keefe; 7—Jardins de l'Alcazar—Favorita, Mons Bonnet; 8—Pot Pourri, from Cielito, Orchestra.

Part 2.—1—Overture—William Tell, Orchestra; 2—Quartette—From the valleys and the Hills—Bohemian Girl, Mrs. Leach and Miss Griswold, Mr. Leach and Mr. Mitchell; 3—Annie on the Banks, Miss Jennie Mandeville; 4—Cavatina—Lucia, Miss O'Keefe; 5—German Polka, Orchestra; 6—Four toulours—Fra Diavolo, Mons Charles C; 7—Aria—Favorita, Mrs. Agatha States; 8—Laughing Trio, The Twelve; 9—Finale—Le Siege de Corinthe, Orchestra.

Part 3.—1—Les deux Jumeaux—Overture, Orchestra; 2—Isoler still in my dreams, Mons Charles C; 3—The Nightingale (with horn Obligato by Mr. Shott) Mrs. Georgiana Leach; 4—The Spill—Lurine Mrs. Agatha States; 5—Pot Pourri from Martha, Orchestra; 6—Jennie with the Light Brown Hair, Miss Jennie Mandeville; 7—Duet Quatro Amor, Miss O'Keefe and Mr. Leach; 8—Les Tribulations d'un Anglais Mons Georget; 9—My Bonnie Lass she smileth, The Twelve; 10—Pony Express Gallop, Orchestra.

Sunday, Monday, and Tuesday,

From 9 A. M. to 11 A. M., the ORCHESTRA will play select overtures and medleys.

The following ARBORS, GAMES, &c., will be under the superintendence of the ladies of the Festival: Arbors, Flowers, Ice Cream, Roman Punch, Bonbons and cakes, Coffee, Tea and Chocolate, Pertumery, Play and Fancy things, Music, Japanese Rarities, Fruits, Oysters, Refreshments, Toilet Articles, Books and Engravings, News and Letters, Curiosities, &c., &c.

There will be three large Lunch Tables, capable of seating one Hundred persons.

GAMES—Flying Horses, Bowling Alley, Fortune Wheel, Bow Shooting—Egyptian Birds, Russian Swing, Barrel Game, Shuttle Board, Pistol and Rifle Shooting, &c., &c. GRAND TOMBOLE.—The following prizes will be distributed as a "SOUVENIR" to all who may honor the Festival with their presence. Every ticket-holder will be given, at the entrance to the Willows, a check for the Tombola, which will be drawn on the afternoon of Tuesday, after the concert.

Prizes.

1—Gold Snuff Box, having a Watch and Magic Bird singing several airs—valued at \$500 (or \$100 cash at the option of the winner); 2—Gold Mounted Clock, representing an armed warrior, \$300; 3—Splendid Gold-mounted Liquor Cabinet, valued at \$175 (or \$100 cash); 4—Seven Machine Iron Wheelbar and Wilson, \$120; 5—Splendid Black Velvet Dress, \$200; 6—Rich gold embroidered Gown de Naples dress, \$125; 7—Silver Cuckoo Basket, \$122; 8—Gold Watch, \$100; 9—Cashmere Morning Gown, \$10; 10—Silver-Mounted Japanese Cabinet, \$80; 11—Japanese Table, richly inlaid, \$50; 12—Completely furnished Japanese House, \$50; 13—Gold Watch Chain, \$50; 14—Gold and Gemset Bracelet, \$50; 15—Rich gold-mounted quartz Breastpin and ear rings, \$50; 16—Elegant Rose-colored Lady's Brevet, \$40; 17—Ornamented Lady's Bonnet, \$10; 18—Beautiful Head Dress, \$10; 19—Bouquet Holder, \$30; 20—Finely Ornamented Sun Shade, \$25; 21—Finely Ornamented Sun Shade, \$30; 22—Elegant Fan, \$30; 23—1 dozen gold lined silver Tea Spoons, \$25; 24—Silver Dipper, \$20; 25—Bouquet Holder, \$30; 26—Bouquet Holder, \$30; 27—Bouquet Holder, \$30; 28—Bouquet Holder, \$30; 29—Fine Glove Box, \$15; 30—Jewell Basket, \$20; 31—Silver Call Ball, \$10; 32—Sun Shade, \$10; 33—Sun Shade, \$10; 34—Sapphire Porcelain Bird, \$10; 35—Pair of White Satin Ladies' Gaiters, \$10; 36—Pair of Shoes, \$10; 37—Pair of Small Shoes, \$10; 38—Pair of Pyraminical Snow Ball Flaxia—very rare in California—and one hundred other prizes, from \$1 to \$10.

Notice.

Tickets can be obtained of the Lady Managers of the Festival; at Messrs. Gensoul, Payet, Du Bois & Co.; Verdier & Kaundler; Guerin, Seelcher & Co.; Tucker's; Ploche & Baycrque; at the Railroad Depot, and at the Willows. At the entrance of the Willows every ticket-holder will receive a Railroad Ticket for returning to the City. No refreshments of any kind will be allowed to be brought on the grounds, except those provided by the Lady managers. The TOMBOLE will be exhibited during the three days of the Festival. A Tombola will also be given by the Ladies at their respective Arbors to any person who will spend Five Dollars in buying one or more articles. A Special Police will be in attendance who will see the rules of order and decorum most strictly adhered to, and visitors are requested to call on them for any little matter that may arise. Jul

CALIFORNIA COAL MINING COMPANY.

CAPITAL, \$5,000,000

IN 50,000 SHARES.

THE BOARD OF DIRECTORS and Trustees of the California Coal Mining Company, give notice to all parties desirous to invest in the Stock of the Company, that Ten Thousand Shares, of \$100 each, of the said Stock are reserved for that Purpose, by resolution of the Board.

The Books of Subscription are open at the office of Ploche & Bayerque, where the required first instalment of 10 per cent will be received.

W. L. A. PICHIE, President.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Considerable activity in mining sales during the last ten days up at Virginia City!

Potosi, \$200 per share.
Central, \$700 per share.
Ophir, \$1100 per share.
Gould & Curry, \$300 per share.
Chollar, \$8 per share.
Lucerne, \$25 per foot.
St. Louis, \$6 per foot.
Mount Davidson, \$30 per share.
Mark Anthony, \$8 per foot.
Louise, \$16 per foot.
Bradley, \$8 per foot.
Sacramento, \$6.
Shelton Co., \$5 per foot.
Josephine, Flowery, \$8.
West Branch, Flowery, \$8.
Harrison, Flowery, \$12.
Yellow Jacket, \$40.
Exchange, East Comstock, \$25.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$18.
Hard-Up, \$5.
Chimney rock, \$12.
Durgin, \$10.
Rich Co., \$3.
Miller, \$6.
Costa Rica, \$5.
Spanish Co. Plymouth Ledge, \$8.
Chelsea, \$6.
King Charles, at Howery, \$6.
Great Western Ledge, Helena, \$10.

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.

[Having completed all the requisite arrangements, we shall in future be able to lay before our readers a reliable list of prices of mining stocks of Utah.]

How to Bandage Cheese.

Mrs. Stephenson, writing to the *Prairie Farmer*, says that cloth covers should never be pasted over cheese, if one wishes to keep the flies off, as the paste will crack and the cloth become loose. By sewing on the covers, and covering them all over, and then rubbing them with butter-oil every day for a couple of weeks, and half as frequently afterwards, they can be kept secure from loss from this cause. She thus describes her method of putting on the covers:

I take a bandage broad enough to lap over an inch or two on top or bottom of the cheese, sew it on at the sides as tightly as possible, run a thread—top securing way—around the edge of the cover, and gather it in, as if you were going to put a crown on a baby's cap, cut out a top piece, and sew it on closely, so that no fly can get between the stitches. Remember, this should be done when the cheese has been but six or eight hours in press, then returned, and allowed to press the remainder of the forty-eight hours, only taking care to turn it again in press about the morrow of the second day, else a rim will be likely to form around the edge of the cheese, spoiling the looks of it. To press thus long, two presses are required, unless we make cheese only every other day.

In regard to the use of rennet, she says: "Use only enough to 'bring the curd' in from thirty-five to forty minutes; less time produces inferior cheese."

Fort Pickens.

This much talked of fort, at Pensacola, says the *Boston Courier*, is in a state of admirable defense—the guns glisten in the sun as a warning monitor not to approach it on a hostile mission. Lieutenant Slemmer, with his garrison, is able, not only to repulse all attacks, but as Pickens commands all the forts and batteries in the hands of State troops, he is also able to silence them in an incredibly short space of time. In construction, this fort is a first class pentagonal bastioned work, built of stone, brick and bitumen, with covered ways, dry ditch, glacis and outworks complete. Its walls are about forty feet in height, by thirteen in thickness; it is embrasured for two tiers of guns, in bomb-proof casemates, and one tier of guns open, or *en barbette*. The guns from this work radiate to every point of the horizon, with flank and enfilading fire in the ditches, and at every angle of approach. From the date of commencing this fort to the period of finishing, was twenty-five years. It cost the Federal Government over one million of dollars. Its present armament consists of: In bastion—twenty-six twenty-four pound howitzers. Casemate, four forty-two pounders, sixty-two twelve pounders. En barbette, twenty-four eight-inch howitzers, six eighteen pounders, twelve twelve pounders, one ten-inch columbiad mounted, and five ten-inch mortars.

Great Discovery of Cinnabar.

For a year past, says the *Napa Reporter* of the 18th inst. there have been discoveries of cinnabar in this county, and various companies have been organized for prospecting purposes. Still, the amount of mineral of actual value has been so slight, that we have never dared to predict any very great success to parties engaged. Indeed, we are opposed to everything in the shape of what may be called "Mining Excitements." But we have now to record the most astonishing discovery of cinnabar ever heard of on the face of the globe. We know whereof we speak, having been one of the party engaged in the exploration. Let us say then, in a few words as possible, that at a point on the Clear Lake cañon, about ten miles from the head of Berryessa Valley, we have found what may literally be called a *mountain* of the mineral in question. The ore is of great richness, yielding, even by ordinary and slovenly retorting, eighty per cent of quicksilver. To extent, so estimate can yet be formed of its limits. Even from the yet untouched surface of the hill, a million tons of the ore might be taken without blasting or tunneling. The mine is in an air line about twenty-five miles from tide-water, and probably forty from Napa City.

Geese can be used for the same purpose as watchdogs. They use warning notes when they are at all alarmed from any cause. The alarm is shrill and startling, has a "very wide-awake, to arms, all hands upon deck" sound; while, when they have no apprehensions, "they emit a contented noise between a quack and a coo." If this new use of the goose comes into vogue, we shall be able to dispense with numerous worthless curs.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved
AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz.

- 1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.
- 2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.
- 3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.
- 4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,
J. B. BEERS

Mat 15 165 Clay street,

TEETH! TEETH! Extracting without Pain! DR. W. H. IRWIN, Dentist, Third street, near Howard (opposite Estill's Mansion) All branches of Dentistry performed in the neatest manner.

Extracting, each, \$1.
Extracting children's teeth, 50 cents.
Filling with gold, each, \$1, \$2 and \$3.
Filling with platinum cement, \$1, \$2 and \$3.
Cleaning, whitening and burnishing, \$2, \$3 and \$5.
Straightening, etc., from \$2 to \$5.
Nerves killed and Toothache cured, \$1.
Whole or partial sets nicely and firmly adjusted on the finest gold, at from (each tooth) \$5 to \$10.

On the best silver plate (each tooth) \$3 to \$5.
Montgomery street Omnibuses pass the office every five minutes. Special attention paid to Children's Teeth. Circulars, giving full directions to parents for the preservation of Children's Teeth. Remember the place—Third street, near Howard.

W. H. IRWIN, M. D.

TO OUR FRIENDS AND THE PUBLIC AT LARGE.

J. C. MEUSSDORFFER, HAVING RETURNED FROM HIS BUSINESS VISIT TO PARIS, desires to invite the whole hat-wearing community to favor him with a visit, and inspect the largest and most beautiful assortment of

Gents', Ladies', Misses', Youths' and Infants' Hats and Caps.

Ever exhibited west of the Atlantic. They were selected by Mr. Meussdorffer himself, who has eleven years experience in this State, and who feels confident that all, even the most fastidious, can be suited.

Our Department for Ladies and Misses contains, among others, the following new styles:

EMPRESS EGGHNE,
BOLEBO EGGENE,
TUDOR NOIR,
ANDALOUX MARRON,
IRLANDAIS GEMME,
FRANCOIS FANTAISIE,
IRLANDAIS MONLOW,
ELEGANT MARRON,

Our extensive arrangements in Paris and New York enable us to sell any kind of Hats at least fifteen per cent cheaper than any of our competitors. Mr. M., having had some very superior MOLESKIN PLUSHES manufactured expressly for him at Lyons, is prepared to produce a finer MOLE HAT than was ever before manufactured. Our prices are:

No. 1 Extra Super Molekin Hats, made to order, \$8
No. 1 " " " " " " " " 6
No. 1 " " " " " " " " 5
Imported " " " " " " " " 4

Meussdorffer's stock of SOFT HATS, CAPS and STRAW HATS, is the largest in the State, and receives additions of the newest styles by every steamer from Paris and New York.

Every one and all,
Please give us a call,
—AT—

Forty Cases of Musical Instruments Just Received,

Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS.

Also, TAMBOURINES, BANJOS, FIFES, FLUTES, CLARION PICALOGES, VIOLIN, BOWS, BOW-HAIR, ROSIN BRIDGES, PEGS, TAIL PICES, FINGER BOARDS, TUNING FORKS, 888 ROMAN STRINGS (four lengths and four thread), and

ALL KINDS OF MUSICAL INSTRUMENTS.

Fresh every two months from Italy.

All of these goods will be sold to the trade, as they are direct importations from the manufacturers of Europe, and imported in large quantities by A. Kohler. He will sell them thirty per cent cheaper than any other house in California; therefore it would be the interest of all to call and examine before purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by the case.

39.—The wholesale department of this House is on Sansome street, occupying the whole block from Clay to Commercial street.

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated
Vermont Reaper and Mower, which is unsurpassed for Simplicity, Dura-
bility, convenience and thoroughness of work.The high estimation in which this Machine is held by those farmers who
have used it, justifies the expectation that, with the improvements, it
will become the leading machine, when its superior qualities are generally
known.SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE
HAS OVER OTHERS, ARE AS FOLLOWS:1st. Having the cutter bar hinged to the frame, so as to adjust itself to un-
even surfaces.

2d. Having two driving wheels, if one slips the other does the work.

3d. When the machine moves to the right or left, the knives are kept in
constant motion by one or the other of the wheels.4th. It can be oiled, thrown in or out of gear, without the driver leaving
his seat.5th. The whole weight of the machine is on the wheels, where it is needed
to give power and stroke to the knives.6th. When the machine is backed, the knives cease to play, consequently
you back away from obstructions, without danger of breaking the knives.7th. The cutter-bar being hinged to the machine, can be packed up with
out removing belt or screw.8th. The cutter-bar is readily raised by a lever, which is very convenient
at the corners of the land; when raised, the machine will turn as short and
easily as any two-wheeled cart.9th. It is mostly of iron, simple in construction, and a boy can manage it
easily.

10th. It has no side draft.

11th. The combined machine has two sets of cutter bars and sickles, one
for mowing, the other designed expressly for reaping, which, with other
improvements, should command the attention of every farmer.We invite Farmers wishing a machine to call and see before purchas-
ing. KNAIP, BURRILL & CO.,

PALTENGHI, THE SCULPTOR.

Often, in passing down Jackson street, between Montgomery and Sansome, have we stood still and looked into the marble yard of Andrew Paltenghi the sculptor—admiring the many exquisite works of art, products of his industrious and graceful chisel, there exhibited. A few days since, we entered the premises, and obtained a nearer view of his admirably executed statues and statuettes of Apollo, Venus, Cupid, Mars, Ariel, Flora and others of the many gods and goddesses of the Heathen Mythology, and we need hardly say that our trouble was more than compensated, not only in the inspection of these excellent productions, but also of elegant mantelpieces, busts, medallions, simple tombstones, and elaborate monuments for the much-loved dead—all finished in the most superb manner. Signor Paltenghi, in the politest possible manner, escorted us through his fine creations, and from him we learned that on arriving in this country, in 1856, he first commenced his business on Bush street, where he remained only a few months, when finding it necessary to have a larger yard, and more artisans, (he employs ten skillful ones at present), he removed to his present location, and has ever since been favored with a constantly increasing demand for his works. We believe his is the only depot for Marble Statuary Fountains on this coast, and he imports most of his marble from Italy, direct. Any of our readers desiring to spend a pleasant and instructive half hour, cannot do better than to examine Paltenghi's wonders of the chisel.

The New Almaden Mines.

Mr. Dewey, of the *Mountain Messenger*, writes from San Jose, as follows:

A beautiful ride it is from San Jose to the Almaden quicksilver mines. Rich fields of grain, large sycamore trees, with smaller shades, greet us on every hand. The road is as fine as a race track all the way. Plenty of wild flowers, squirrels, and sweet songsters to cheer the pleasure seeker who passes that way. We spent the day at the village at the foot of the hill. A beautiful brook runs through the narrow flat between the mountains. There are many fine shade trees along its banks, undergrown by green sward and poison oak. A country hotel furnishes country "grub" at reasonable prices. Betwixt these attractions, an excellent soda spring and several companions, we had no lack of enjoyment. The mines are in full operation. Their yield is immense. The company is now building a new furnace of five times the capacity of the old one. A new lead has been struck by sluicing off the dirt about an old furnace stand. The workmen have reached the depth of eighteen feet below the surface, and the quicksilver is still found in little globules so thick that a stream always follows the stroke of the pick. Quicksilver is worth about forty-five cents a pound, and six men are daily sluicing out between \$800 and \$900 worth. A stone and brick pavement about two feet thick, surrounded the furnace, but the quicksilver for years seems to have gone through it and the hard earth beneath, as easily as water penetrates a sieve. How deep it has gone down remains to be proved. The dirt, so profusely filled with such bright silvery-looking beads, presents a rare appearance.

Capital Surgical Operation.

On Sunday last, says an exchange, a man by the name of Applet, residing near Tholomne City, accidentally shot himself in the shoulder-joint of the left arm. He was about leaving his house upon a hunting tour, and on setting his gun down upon the stoop (it being on half cock) the hammer struck on the projecting edge of a board, and falling, discharged the contents of the gun as above mentioned. Mr. Applet, who is a man of fifty-four years of age, and resides about one and a half miles from any neighbor, succeeded in reaching the house of Mr. Walden, where he was cared for, and from which place a messenger was dispatched to the city for surgical aid. Drs. Norcom and Reid were called, and on arriving at the house found the patient in critical condition, the bone being terribly shattered, and the wound, which had remained forty-eight hours without treatment, filled with maggots. The surgeons performed the operation of amputating the arm at the shoulder joint. The patient, as we are informed, is doing well, and is now in as favorable condition as possible for recovery.

A Destructive Insect.

A new insect, called a "borer," is making sad havoc among the fruit trees in the valleys, especially in lower Placer. It is represented as a very diminutive insect or borer, which makes a bee line in whatever direction it starts—horizontally, or at any degree of altitude—and goes right through the tree, when it probably turns and hores back again. The hole made by this insect is cut as clean and precise as if worked by the sharpest instruments and in the best style of art, and is so small that it will only admit the finest wire. This is believed to be a new kind of borer—a very destructive one—but if its hole can be discovered it is easily killed by a single prod with a piece of wire. The first evidence of the presence of this new enemy to fruit trees is the leaves turning yellow, and, we suppose, the bark on the sunny side of the tree, about six inches above the ground, turning black. Those who have fruit trees had best see to them. Frequent washing of the trunk of the tree with strong soapsuds is a good preventive of the borer, as the fly, resembling the bee and wasp somewhat, deposits its eggs in any little crevice or hole in the bark, the heat of the sun hatches out the borer or worm, which is very fast in its growth, thriving from the sap of the tree, immediately under the bark—and when a week or two old commences to pierce the solid wood, as above described. The borer is perfectly white, with large head, and when full grown, is sometimes an inch long. This is our personal experience with the "borer."—*Placer Courier*.

THE HUMBOLDT CITY SILVER MINES.—These diggings, writes a silver hunter to the *Plumas Standard*, are located about eight or ten miles from Lawson's Meadows. Humboldt city is in what is called Linsey cañon, and consists of fifteen or twenty stone houses, and a large commodious restaurant. About twenty-five or eighty men are at work and all appear to be very enthusiastic about the mines. Some fifteen or twenty different ledges have been discovered and the rock from all looks favorable. The great scarcity of tools and provisions has prevented the working of the several ledges to a great extent. Assays have been made, and from three to nine hundred dollars to the ton obtained. Provisions are plenty and cheap there at present. Persons going there should go prepared with powder and blasting tools, as none are to be had in that vicinity, and nothing can be done without them. Timber is scarce; but it is a fine grazing country, and plenty of water can be had at all times. The Indians are friendly.

HUNG.—For the murder of James Hannover, Charles Giddings was executed at Stockton on the 25th inst.

CALIFORNIA WINE.

CARD.

LAKE VINEYARD, Los Angeles county, Cal., }
March 21, 1861.

J. MARTENSTEIN. A. WALRATH. WM. BROWN,

NATIONAL Steam Flour Mills, J. MARTENSTEIN & CO., proprietors. Dealers in Domestic Flour, Corn, Meal, Buckwheat Bran, etc., Market street end of Sansome, San Francisco.

The proprietors of this mill are all old and experienced Millers. The mill is perfectly new, and fitted up with all the modern appliances, and can do more work than any mill offers capacity in the State. We invite all to call and examine for themselves the quality of flour we manufacture. Orders respectfully solicited. Jm1 J. MARTENSTEIN & CO.

THE above faithful illustration presents to our readers the National Flouring Mills, Nos. 561 and 563 Market street, directly facing Sansome street. The mill is a four story building, of forty feet front by 60 feet depth, and was erected by J. Martenstein & Co., on the 22d November, 1860, at a cost of \$35,000. It contains an engine of 100 horse-power and four run of burrs. The energetic proprietors are now erecting new machinery and McCauley's patent engines, capable of making three hundred barrels of flour per day! We visited the mills yesterday, and were struck with the amount of work so rapidly and so cleanly done—and with so little noise and bustle too. The flour made at the National Mills bears a high reputation in our market, and all the harm we wish its gentlemanly proprietors is, that it will ever be considered superior to any other flour made in California.

BETTER LATE THAN NEVER.—On the last day of the Session, both branches of the Legislature passed a bill, appropriating \$20,000 to build a branch State Prison at Folsom.

HAWLEY & CO.,

DEALERS IN

Hardware, Building Materials, Carpenter's Tools, AGRICULTURAL AND MINING IMPLEMENTS, Circular, Mula and Mill Saws, Blacksmith's Tools, Cordage, POWDER, FUSE, ETC., ETC.

TO FARMERS.

We have the following Machines, which we will sell at greatly reduced prices:

ESTERLY'S SELF-RAKING REAPER AND MOWER, Which gave better satisfaction to Farmers last season than any other Machine. Also, the

KENTUCKY HARVESTER,

A Combined Reaper and Mower. Also,

KETCHUM'S TWO-HORSE REAPER AND MOWER,

Ketchum's one and two-horse Mowing Machines. Also the justly celebrated

BUCKEYE MOWER,

The best Mowing Machine in the world. Its superiority over other Machines is that it has two driving wheels, which support the whole weight of the Frame, Gearing and driver, giving it nearly double the power of a machine which has but one driving wheel. It has a double hinged finger bar (which belongs exclusively to the Buckeye Mower), which can be raised to pass obstructions. The bar can be folded over the top of the frame with perfect ease, so that it can be moved from place to place without trouble. It has no Cog Gearing in the Driving Wheels; it is entirely free from side draught, and has no weight on the tongue or horses' necks. The draught is lighter than ordinary plowing. Also,

RUSSELL'S PATENT THRESHING MACHINES,

Made by Nourse, Mason & Co., Boston, Mass. Farmers will find it greatly to their advantage to call and examine these Machines before purchasing for the coming harvest.

For sale by HAWLEY & CO.,

my23 Corner of Battery and California streets, San Francisco.
Corner of E and First streets, Marysville.

WE ARE NOW PREPARED TO RECEIVE GUESTS

—AT OUR—

NEW SALOON,

327 Montgomery street, TUCKER'S BUILDING,

—FOR—

BREAKFAST, LUNCH, AND SUPPERS,

Where will also be kept on hand every variety of CONFECTIONERY, JELLIES, ICES, PASTRY, CAKES and BREAD. Our Manufacture is on the premises, where we make every article sold from our counter. We are prepared to furnish Balls, Weddings, Reception Parties, or Families, with every article desired, in small or large quantities. All will find it to their advantage to examine our goods, as they will find them manufactured from the very best material, and with utmost care, and sold at reasonable prices. The Manufacturing Department is under my own immediate supervision, and having had over twenty years experience in our business, we feel much confidence that we shall please the public. NO 11.

SEFTSTROM'S BLAST FURNACE.

The annexed engravings faithfully illustrate Seftstrom's Blast Furnace—the arrangement of which and extreme portability render it superior to all others for the traveling assayer. It is formed of two cylinders of sheet-iron, placed one within the other. *c* represents the outer cylinder, and *g* the inner one, lined with a coating of fire-clay, about an inch in thickness. Both cylinders are provided with a bottom, and are fixed together by the top, air tight, in such a way as to leave an equal space between sides and bottoms, as exhibited in the figure. The smaller cylinder and its lining of fire-clay is pierced near the middle of the sides with eight holes, all pointing toward the centre of the furnace. The crucible to be heated is placed in the middle of this arrangement on a piece of fire brick, kept in its place by a little fire-clay. The air is blown into the opening *a*, which is connected with the nozzle of a double action-bellows, and is thus compressed into the space *b*, and thence driven through the holes *o* into the cavity of the furnace. Instead of using bellows a current of air may be advantageously supplied by means of a rotating fan, similar to those which are employed for domestic purposes. When this blower is employed, the nozzle should be held at a distance of about a quarter of an inch from the orifice *a*, which in this case must be made slightly funnel-shaped. The heat thus produced is exceedingly intense; so much so, that a furnace, having an internal diameter of six inches, and externally as large as an ordinary hat, is capable of melting, with the greatest ease, several ounces of cast iron. The fuel used for a small furnace of this kind should be charcoal broken into pieces of about the size of nutmegs. This uniformity is readily obtained by breaking the fuel into fragments of nearly the size required, and then sifting it through two sieves, one of which retains all the pieces which are too large, whilst the other lets through all those which are too small. When however, the materials for its erection can be obtained, the ordinary wind furnace is to be preferred. The figure with the chimney represents this apparatus.

Wherever it can be conveniently managed, it is desirable that the ash-pit of the furnace should be placed beneath the floor of the room in which it is situated, and communicate either with the cellar of the house or with an opening made in front, which for the sake of draught is covered by an iron grating. The inner cavity of the arrangement may be made either round or square; but for large operations round furnaces are generally preferred, although, for the purposes of assaying, square ones are more commonly used. The cross section of this furnace is a square, of which each side may measure twelve inches. At *e* is the grate, consisting of several bars of wrought iron, united together and turning on a hinge. The side of the grating opposite to the hinge rests upon an iron bar *p*. This bar is moveable, and can be withdrawn on pulling a knob on the outside of the furnace. When this is done, the grate falls perpendicularly on its hinges, and allows the fuel to escape into the ash-pit beneath. The mouth of the furnace is closed by an iron plate *h*, lined with fire-clay, and fastened to a chain, by the aid of which and the pulley *r* it can be opened, when it is necessary either to throw in fuel or to stir the fire. In this plate there is a small hole *n*, which can be closed by a moveable iron cover. This is used for occasionally viewing the interior of the furnace. From the internal cavity the heated gases pass into the chimney *c* by the canal *b*; the cross section of the flue, like that of the furnace itself, is a square, and the depth of the furnace, from the fire bars to the moveable cover, may be from two feet to two feet two inches. In many furnaces the cover, instead of being hung on hinges, as above described, is simply made to slide loosely over the aperture. The chimney of a furnace of this description should be at least twenty feet in height.

The opening *b*, between the furnace and the chimney, should be about eight inches by two; but should it be required, these dimensions may be readily diminished by means of a little fire-clay, and some pieces of refractory brick. The internal lining of such furnaces is commonly made of refractory bricks, bedded in fire-clay, but in default of the former material a lining of fire-clay alone may be readily substituted. The chimney must be provided with a damper for the regulation of the draught.

When this furnace is to be employed to effect a fusion, the opening *i* is closed by a piece of fire-brick; another fragment

of brick is placed on the grate, and on this stands the crucible in which the experiment is to be made.

When employed for making cupellations, the muffle is introduced through the opening *i*, and rests on the bars *o o*. This furnace is not recommended as being of the best form and dimension that could possibly be used for the purposes of assaying, but is extremely useful for general purposes, and can, if required, be employed for running down large quantities of gold dust.

Attempted Highway Robbery—Singular Escape.

On Monday night, says the *Shasta Herald*, of May 30th, Joe Fouchet, Wells, Fargo & Cos.' Weaver messenger, narrowly escaped with life and treasure, on his down trip from that place to Shasta. He was traveling at a slow pace, the night being exceedingly dark, and although on the alert, was unaware of the proximity of danger until the sharp click caused by the cocking of a gun close by his side and the peremptory demand to "stand and deliver," revealed in a manner more unmistakable than pleasant his critical situation. Feeling certain that to wheel and escape would be exceedingly problematical if not impossible, he boldly threw himself backwards from his horse, clutching with great presence of mind his canteen in which was a \$5,000 bar; and although badly bruised by the fall, yet so cleverly was it done, that, favored by the darkness, he made good his escape. His calculations were right, for in spite of his plunging, the frightened animal he was riding was immediately secured by the robbers. Joe immediately footed it to the Tower House, treasure on arm, where shortly afterwards his horse brought up. An examination of the ground next morning, showed that several were engaged in the dastardly attempt.

A PIECE OF NATURAL SURGERY.—A friend of ours reports the following extraordinary piece of natural surgery: Two months ago he had a pet cat who had the misfortune to lose one of its eyes in a scrimmage with his fancy dog. The eye was so badly bitten that all of the iris ran out, and for six weeks was quite invisible. Well, within the last fortnight the lost eye has been gradually refilling, and is now as perfect in sight as it ever before was. If anybody doubts this story, we'll vouch for it and produce the cat.—*San Andreas Independent*.

PLACERVILLE ASLEEP.—Placerville, which is second in business activity to San Francisco only, is yet unwakened to the importance of retaining the advantage in trade and travel which she has gained and thus far maintained over all her mountain neighbors, by the speedy construction of a railroad from this city to Folsom, a distance of twenty-eight miles. Will our citizens view the operations of Auburn, Marysville and Nevada in attempting to take from us the trade and travel to Washoe, and the overland travel to St. Louis and the Atlantic Western States, without making a really determined effort to establish a basis upon which the project of building this road can be successfully consummated? Assuredly it can but be apparent to every business man in our city that if we permit Nevada and other northern places to build railroads without doing likewise ourselves, we are ruined so far as the business prosperity of Placerville is concerned. If we lose the Nevada Territory trade and travel, our flourishing city will retrograde to its old, little and slow business habits, our population will decrease, property will depreciate, and we shall have to depend wholly upon the gardens and yield of the mines in our immediate vicinity. Our people certainly know that it is to their interest to build a railroad which will connect us with the Sacramento river by steam, and that such an enterprise will be the substantial making of a very large and influential city of Placerville.—*Central Californian*.

A BUILDING AND LOAN SOCIETY.—Some of the wealthy men of our city have recently organized an association called "The California Building and Loan Society," having for its object the purchase of real estate, the erection of dwelling houses and other buildings; the improvement, management and disposal of the same for the common benefit; the securing of means for the investment of small sums and savings of the members; that opportunities may be afforded to persons desirous of obtaining capital on a reasonable interest, by the giving for such loans as may be made, solvent security. The capital stock is fixed at \$500,000, divided into \$100 shares, with a reserve right to increase or diminish the same, the society being designed to exist fifty years (unless dissolved sooner legally), and to be managed by a Board of Directors. The place of business of the society is in this city.

THE OAKLAND BAR.—Capt. Basset, the contractor, has completed the job of dredging the bar, and has removed the machinery, giving the ferry boats an unobstructed passage at all stages of the tide. We are not advised whether it has been accepted by the Commissioners. We presume, however, that it will be, and that the remaining bonds will be issued at the next meeting of the Board of Supervisors. The job has been more expensive than contemplated by Mr. Basset, and the profits, if any there are, will be very small. He has dug over a space equal to six and a half acres, and removed over 20,000 cubic yards of earth. In addition to this a line of cribs filled with rock has been sunk upon each side of the channel to guard against its filling up again.—*Alameda Herald*.

FISHER'S INVENTIONS.—Our ingenious fellow-townsmen, J Hyde Fisher, has just completed, for exhibition in New York, a beautiful model of a sleeping car for railroads. The workmanship of this model is very tastefully executed and it is larger than the one made to be deposited in the patent office. He obtained his patent Oct. 23d, 1860, and we think it will be generally adopted by the railroad superintendents of the Atlantic States and Europe, as it seems to be perfectly adapted to the design. It seems Mr. Fisher is also the patentee of a pick which obtained the first premium in this State, and he is now perfecting an instrument for mending and connecting telegraph wires.—*Central Californian*.

[For the Mining and Scientific Press.]

Geological Constitution of the Sierra Nevadas.

BY AUGUSTE REMOND.

THE Sierra Nevadas, which to the East partly bound California, unite southward with the Coast Range; to the North, it is united with it by Lassen's Butte and Mount Shasta. The flank of those mountains presents a considerable development; the distance from the base to the ridge is more than sixty-five miles, and their highest points of elevation reach 15,500 feet above the level of the sea.

The western slope of that vast chain being from north to south, composed almost of the same rocks, I shall speak but of that section of country including the towns of Knight's Ferry, Sonora and Columbia.

The Sierra Nevadas can be considered as being principally composed of three distinct formations. They are, from bottom up, granites and sienites, cambrian schists, and saccharoid limestones. To these may be added the tertiary deposits, which skirt the foot of the chain, and the volcanic products scattered over a great part of its surface.

We shall not speak particularly of the relative age of those different formations, nor explain the revolutions they have undergone; this will be the subject of a special article.

The very base of the Sierra Nevada mountains commences at twenty miles from Stockton. From that point a gentle undulation of the surface is observable, and small hills of tertiary formation are seen on every side; horizontal strata cropping out in long lines on their sides. Hills of this character soon limit the view on each side; and, at first of slight elevation, they rise gradually, as far as Knight's Ferry, on the Stanislaus. At this point, the tertiary hills rise high above the stream, and the strata, which are distinctly exposed, lie piled together nearly 2000 feet thick. The strata of these formations are perfectly horizontal and composed of limestone, sandstones and thick beds of conglomerates. (R. R. Exploration).

These tertiaries were deposited immediately after the principal upheaval of the Sierra Nevadas, during the phoenice period; some are found resting on the schists or slates, and some on the granite.

These sedimentary deposits have ramifications, which spread as far as Montezuma, Scraperville, Whimtown, Dentville, etc. In some other places of California, the sandstones are variously dipped, but we must attribute that to different volcanic phenomenon which were effected during the quaternary epoch and the recent traces of which are found everywhere.

That singular formation, known under the name of Table Mountain, belongs to the same period. This mountain is formed of an immense overflow of basalts, which seem to come from the east. The volcanic matter, when fluid, outspread and produced a series of table lands or broad steps, each of them being several miles long, which are gradually losing their thickness, as far as Knight's Ferry, where they cover the tertiary strata in several places. These basaltic rocks are irregularly cut, and are seen near Montezuma, and not far from Abbey's Ferry. A beautiful view of them can be obtained from the Raw Hide Ranch. At some distance from Knight's Ferry, one enters the schistose formations, after having gone across one, the first flat summit of Table Mountain. There, the nature of the strata is entirely changed. The beds are not horizontal, but present a high angle of dip, having been upheaved to the east by the Sierra. At the first glance, their inclination is believed to be toward the west, because the schistose rocks can, in this respect, occasion many errors, from their being split in every direction. They present two inclinations—one apparent and the other true. Besides their division in beds, these schists are split almost perpendicularly, and it is this second division which deceives at the first sight; for, the first strata following the slope of the mountains, the second, which are perpendicular to them, will appear slightly dipped to the west.

There are only these last beds that are to be seen on the surface; sometimes they rise above the soil in masses twenty or thirty feet high, at others their height is such that the astonished traveler would take them for graveyard tombstones. The vertical position of the slates is one of those peculiar features which attract the attention of almost every person traveling in this country. From their appearance, resembling memorials in an old churchyard, they have been termed the gravestone slates. These rocks bear no characters, it is true, but they will always say much more than the best engraved inscriptions.

These schists extend from Knight's Ferry as far as Sonora; at or very near this height they are no longer seen.

Those ancient sedimentary strata, which previously were but schistose clays, have been transformed into argillaceous schists or slates in which are inserted beds of sandstones; near the point of contact with the granites and sienites, those formations have been powerfully modified by volcanic heat. These metamorphoses attract attention principally before reaching Sonora. Here are high hills of white talcose and micaceous schist, long veins of steatite with pure talc in them, are met with—elsewhere, the Cambrian sandstones have been turned into quartzites, which appear as though they had been violently struck north from the inner to the outer sides. Two miles from Jamestown, on this side of Table Mountain, there are two hills of a remarkably singular appearance; they were formed by the upheaval of a vein of quartzite or metamorphic quartz, which stretches from north

to south; its length is more than twenty-eight miles, and it goes through Carson Hill, Campo Seco, Coulterville, etc. These veins are almost always auriferous.

All these rocks of the Cambrian epoch have more or less lost their first aspect. The greatest part of them contain sulphuret of iron, and in the schists of Table Mountain the pyrites are found in beautiful cubic crystals of a blinding yellow. In these primary formations, veins of amianthus and carbonate of lime, with different other minerals, are also met with.

Strata of slates, perhaps Silurian, seem to lie in unconformable stratification over these different Cambrian deposits, as may be seen one mile from Montezuma, at the foot of Table Mountain. In some places, the schistose matters are divided in very thin pieces and form pretty good slates.

On going out from these primitive formations, the white limestones are entered; these extend like a long and narrow belt, wanting, or rather disappearing in different places, and in some others being two miles broad. These limestones, as the schists above described, are metamorphic rocks, for primitively they were the bottom of a deep and probably cretaceous sea. Those beds of chalk, when the sienites and granites were lifted up by the trap rocks, have been upheaved, overthrown and deeply modified; at that time they lost their first appearance for the crystalline structure they now possess, took various colors and were turned into those beautiful marbles which are found near Columbia, Sonora, and many other places, and so much admired.

There, the white limestones which underlie the vicinity of the first town, Columbia, and form the base upon which it is situated, are peculiarly compact and finely granular; they are seamed and veined with blue, and sometimes appear like a mixture of blue and white grains, forming a very good marble. The blue lines are generally parallel, and correspond to the trend of the beds. These layers or beds are evident marks of the sedimentary origin of these marbles. (R. R. Exploration).

The surface of these rocks is very unequal, being furrowed by deep crevices, filled up with gravel and auriferous blue clays; when the earth is removed from the fissures, the limestone stands like irregular columns or big walls, having a slight inclination, and presenting the most whimsical forms. Sometimes the miners find large pieces of asbestos between the clay beds and the limestones, as in Sawmill Flat for instance.

The marbles of Tuolumne county can be divided into two principal kinds, each of them including several varieties. Some are coarse-grained and highly crystalline; their color is bluish, or white with blue lines. It is this kind that is the most common and which predominates in Sonora. The other saccharoid marbles of the second kind attract notice, with respect to the small blue lines which cross each other in every way, within a white paste; in certain varieties the colored seams disappear, and then the limestone possesses a bright whiteness; but in others the white color is entirely gone, and it has been replaced with a dark blue tint, inclining to black.

What distinguishes principally these species is the composition—the first being pure carbonate of lime and the second generally containing silica.

The schists and sandstones are found passing into these limestones, the limestones passing into the quartz, the quartz into granites, the granites into sienites, the sienites into feldspar, etc. All things in creation are links of an immense chain, the rings of which are perfectly united, and that, as well among the rocks as among the living beings.

[To be Continued]

The Mammoth Cave of Calaveras, etc.

THERE is not a road of equal length in the world, on which so many natural wonders may be seen as that which connects Cave City with the Big Trees. First is the Calaveras Mammoth Cave, as yet not half explored, but full of the most remarkable and astonishing curiosities, and furnishing subjects for the study of the learned and unlearned at every angle of its labyrinthine aisles. In this cavern, at the extremity of a large chamber, hung with glittering stalactites, and not less than 300 yards from the entrance, is a lake of unknown extent, but so far as it is to be seen, of the clearest water the eye ever beheld. It loses itself to sight amid low dipping partition walls of rock, worn by the slow-dropping waters into all manner of odd shapes; and when the spectator shouts upon its nearer bank, his voice echoes along these jagged banks which surround its hidden waters, for more than a minute. We trust that some of the adventurous parties who may visit the Cave this summer, will take the trouble to explore its crooked paths, and its mysterious lake at greater length. After leaving Cave City, and to the eastward some seven miles, are the falls of the San Antonio, secluded from the world by a position hitherto out of the way of all the lines of travel, but now directly on the new route. They are worthy a special visit, as well from their intrinsic curiosity as from the sublimity of their surroundings. On this river, near the Falls, is an excellent trout-fishing range. All along the route, from a mile east of Cave City to the Trees, the traveler is constantly in sight of grand and imposing views. The distances are as follows: From San Andreas to Cave City, ten miles; thence to McNair's Ranch, five miles; thence to San Antonio Falls, two miles; thence to Sleeper's Mill, three miles; thence to the Trees, two miles—total, twenty-two miles from San Andreas to the Trees.—*San Andreas Independent.*

HEYNE MANN, PICK & CO.

311 and 313 California street,

WAREHOUSE OF THE SAN FRANCISCO

PIONEER WOOLEN FACTORY,

Have Constantly on Hand

A FULL ASSORTMENT OF WHITE, BLUE, GREEN AND SCARLET, 2½, 3 and 4 point Blankets.

—ALSO—

Superior All-Wool Family Blankets.

—ALSO—

Sluce Blankets, especially adapted for Quartz Mining. This article has met with general approbation, and Quartz Mills in general will do well to give it a trial.

Having made great improvements in the works of the Factory, including new steam engines, etc., special attention will be paid to the execution of all orders.

Steamers and Hotels can be supplied with Blankets at the shortest notice. Buyers will please examine the California make, the superiority of which over imported Blankets is generally admitted.

All business connected with the Factory is transacted exclusively at their office—no other party being connected with it. ap19

HUNT'S**IMPROVED FIRST PREMIUM WIND MILLS:**

AN ASSORTMENT KEPT CONSTANTLY ON HAND AT THE MANUFACTORY,

Nos. 30 Second street, 208 & 201 Jessie street, SAN FRANCISCO.

THIS WINDMILL WAS AWARDED THE FIRST PREMIUM AT THE MECHANICS' FAIR OF 1860, in San Francisco, for its great simplicity, strength and durability. It is easily controlled, and will be sold cheaper than any other Mill built. Further particulars in circulars.

The following committee awards the above premium: Devoe, Garratt & Ware; all of this city.

PRICES.—Eight feet wheel, \$50; Ten feet wheel, \$75; Twelve feet wheel \$100 to \$125. ap19 E. O. HUNT, Builder.

UNDERTAKING.—The undersigned would most respectfully inform their friends and the public that they have opened their

COFFIN WAREHOUSES

at 161 Sacramento street, below Kearny, and are ready at all times, night or day, to attend to every call in their line of business. Their stock is very complete, and will enable them to furnish every description of funeral, plain or costly, at the shortest notice.

All persons wishing to make interments in Lone Mountain Cemetery, can do so by applying to us at 161 Sacramento street. nov3

MASSEY & YUNG.**METALLURGICAL WORKS**

For the Extraction of Gold from Sulphurets and Quartz Tailings.—A Mining Engineer, thoroughly acquainted with this business, practically and theoretically, offers his services to a responsible party with the necessary CASH, for the construction and superintendence of works of this nature. Further particulars at the office of the Press. ap19

VULCAN IRON WORKS CO.

P. TORQUET, MANAGER.

STEAM ENGINE BUILDERS, BOILER MAKERS, IRON FOUNDERS AND General Engineers, First street, near the Gas Works, San Francisco. Steamboat Machinery built and repaired; also, Saw, Flour and Quartz Mills, Pumping and Mining Machinery, etc. The Vulcan Iron Works Co. invite the attention of Quartz Miners and others interested to their new style of Portable Dry Crushing Batteries with wrought-iron framing. feb5

FIRE INSURANCE.

The undersigned offer Insurance in the following well-known first-class companies, on the most favorable terms:

Hartford Fire Insurance Company, Hartford.

Phoenix Insurance Company, do.

Merchants' Insurance Company, do.

City Fire Insurance Company, do.

Charter Oak Insurance Company, do.

McLEAN & FOWLER, Agents., Office—North-east Corner of Clay and Battery Streets. ap4

TO INVENTORS AND DISCOVERERS, MECHANICS AND MACHINISTS:

The undersigned, having had great Experience and Facilities for completing and carrying out Inventions and Improvements upon all kinds of Machinery and Implements, also preparing the requisite Drawings, Models, Drafts and Specifications, and is otherwise conversant with all principles in Mechanics of modern practice, and could prove, therefore, of invaluable aid to Inventors and Discoverers. Those contemplating bringing their inventions in a proper shape before the U. S. Patent Commission are particularly requested to consult the subscriber.

WILLIAM A. BURKE,

At A. Kohler's Piano and Music House, ap11 Sansome street, between Clay and Commercial, up stairs.

RUSSELL MILL DUCK.

From No. 10 to 120.

FOR HYDRAULIC MINING.

Guaranteed Equal if not Superior to Lawrence Duck.

WE are in regular receipt of this favorite brand of Duck by almost every Clipper ship, and are satisfied if it is given a trial by the trade that has been buying heretofore the Lawrence Duck exclusively, will give satisfaction.

For Sale by April 13-3m

JANSON, BOND & CO. Cor. Battery and Clay Sts.

TO GOLD AND SILVER MINING COMPANIES.**The Pacific Metallurgical Works, North Beach,**

Are now prepared to crush all kinds of Rock or Sulphurets, and of a suitable fineness for sale or reducing. For terms, etc., apply to

BRADSHAW & CO., Agents,

Cor. of California and Sansome sts. my17.

A. DURKIN & CO.,**MISSION STREET BREWERY.**

Mission st., near Second, San Francisco, California, THE FINEST ALE AND PORTER ON HAND.

ASSAYING. *

Kinds of Assays.

The thorough miner ought to know how to make assays. If working in auriferous quartz or silver ore, he should frequently make assays to ascertain whether he loses any of the metal and how much, and to know whether the rock will pay for working, and how it should be worked, for the best manner of treatment will sometimes depend upon the richness of the mineral.

Assays are of two kinds, "qualitative" and "quantitative," the former to ascertain whether a certain substance is in the mineral, the latter to determine how much. A qualitative assay of ore for silver is made to learn whether there is any of that metal in the ore; the qualitative assay shows the exact amount of the silver in it.

Means of Assaying.

Assays are made with acids, by smelting in crucibles and by melting under the blowpipe. The processes are numerous and complicated, and some of them require a very nice knowledge of chemistry. I shall not attempt therefore to explain them all.

Some of the processes which I describe here under the head of Assaying, are often called "prospecting" by miners; but it is more convenient for me to treat of an examination of quartz rocks made with a horn spoon as an "assay" rather than as a "prospect."

Gold Assaying with a Spoon.

Every quartz miner has a horn spoon for prospecting his lode and finding what part of the rock will pay. This horn spoon is made of ox horn, one half of which is cut away, leaving a bowl six or eight inches long and nearly three inches wide. He pulverizes his rock on a smooth hard stone, a foot square. After breaking the quartz with a hammer he uses a muller or hard smooth stone, about four inches square, to crush the quartz to a fine powder. He washes a handful of this powder in his spoon, which he uses like a pan, and if he can find a few specks of gold in a handful, he infers that it will pay. If he finds not a speck in a pound of rock, he infers that it will not pay.

Assay of a Metallic Substance.

If any assay is to be made of a metallic substance to find out how much gold is in it, a chip should be cut off from one corner, weighed in assayer's scales, put into a cupel, heated to melting, then withdrawn and allowed to cool. The cupel is a little cup made of bone dust for the special purpose of assaying, and when base metals are melted in it, it swallows them up, leaving the precious metals, gold and silver, pure. The button from the cupel is now melted with enough silver to weigh three times as much as the gold in it. This addition of silver is necessary to enable nitric acid to eat away the silver that was in the button, for when there is a little silver in much gold, the acid cannot get at the silver. There ought to be three times as much silver as gold to enable the acid to work to advantage. The gold and silver having been mixed in the proper proportions, are rolled into a thin ribbon. This is boiled in nitric acid, which leaves the gold pure.

Gold Assay by Smelting.

If auriferous quartz, free from sulphurets, is to be assayed, four hundred grains of the rock finely pulverized may be mixed with an equal weight of litharge and five grains of charcoal. Put this mixture in a crucible large enough to contain twice as much more: then put the crucible in the furnace and melt the mass. Remove from the fire, allow the crucible to get cold, break it and the metal will be found in a button at the bottom, covered with a slag of melted rock and other matter. Treat the button as prescribed in the preceding paragraph.

If the rock to be assayed contains pyrites, it must be roasted till it ceases to give out sulphurous fumes. Mix four hundred grains of the powder with two hundred grains of litharge, two hundred grains of dry carbonate of soda, two hundred grains of dried borax and ten grains of charcoal; then put into the furnace and treat the button as directed in the last two paragraphs.

Presence of Copper Pyrites.

Copper pyrites in quartz sometimes bears so close a resemblance to gold as to deceive even experienced miners; and of course it is far more likely to deceive the inexperienced. Indeed, iron pyrites often deceive these. The best method to discover the presence of pyrites, either of copper or iron, is to pulverize the mineral, put it into a saucer with some nitric acid, and that over a few embers, till dark red vapors rise. If pyrites be present the acid will be discolored. Or resort may be had to the hammer; if the mineral flattens out on the anvil, it is gold, if it breaks into fragments it is pyrites. The latter substance is usually in rectangular crystals; gold never takes that form.

Silver Assay with Testing Tube.

The best qualitative silver assay for the general miner, is that with the testing tube. This is of thin glass, about five inches long, and five-eighths of an inch in diameter; of a rounded bottom, with the same thickness as the sides. Enough of the mineral finely pulverized is put in to occupy an inch of the tube. On that is poured two inches of nitric acid. The tube is placed over a spirit lamp or a fire, till

* Bancroft's Hand-book of Mining for the Pacific States.

the acid boils. Nitric acid dissolves silver; and by this treatment, if there be any silver in the mineral, the acid must take it up. Filter the acid now through filtering paper, which can be had at the drug shops, and pour the acid back into the tube. Pour in a few drops of solution of common salt, and if there be any silver in the mineral, a white cloud or curd will be formed in the acid, by the silver precipitated by the salt. If there be no cloud there can be no silver. If there be a cloud the mineral contains either lead or silver. Pour off the acid and expose the precipitate to the sunlight; in five minutes, if silver, it will turn purple; then pour on some spirits of ammonia, and the silver will be dissolved again. If a testing tube is not to be had, a common saucer may be used.

Silver Assay by Smelting.

SILVER ores are of two kinds; those containing lead, and those free from it. The former usually contain a large amount of lead, or rather, they are lead ores containing a little silver, and called argentiferous galena. The mode of assaying with the crucible, and also of working the lead-bearing silver ore, differs from that of the ore free from lead.

To assay argentiferous galena, mix four hundred grains of the pulverized ore with twelve hundred grains of carbonate of soda and forty grains of charcoal; put into a crucible, and that into a furnace; raise the heat sufficient to melt the mass; take out the crucible, give it a tap or two, to shake the metal to the bottom of the melted matter; let it cool; take out the button which should be heated in a cupel, to drive off the lead, leaving the silver free.

Silver ore not containing lead may be assayed by mixing four hundred grains of ore with 400 of litharge, eight grains of pulverized charcoal, two hundred grains of carbonate of soda. This mixture is put into a crucible, a thin layer of borax is sprinkled over it, and it is put into the furnace, and treated as directed in the preceding paragraph.

Assaying Gold Quartz by Weight.

Phillips, in his little work on Gold Mining and Assaying, gives the following rule for ascertaining the amount of gold in a lump of auriferous quartz:

"The specific gravity of the gold—19,000.

The specific gravity of the quartz—2,600.

"These numbers are given here merely for convenience in explaining the rule; they do not accurately represent the specific gravities of all quartz and quartz gold. (The quartz gold of California has not, on an average, a specific gravity of more than 18,600).

"1. Ascertain the specific gravity of the lump. Suppose it to be 8,067.

"2. Deduct the specific gravity of the lump from the specific gravity of the gold; the difference is the ratio of the quartz by volume: 19,000—8,067=10,933.

"3. Deduct the specific gravity of the quartz from the specific gravity of the lump; the difference is the ratio of the gold by volume: 8,067—2,600=5,467.

"4. Add these ratios together and proceed by the rule of proportion. The product is the percentage of gold by bulk: 10,933:5,467=16,400. Then as 16,400 is to 5,467, so is 100 to 33,35.

"5. Multiply the percentage of gold by bulk by its specific gravity. The product is the ratio of the gold in the lump by weight: 33,35x19,00=633,65.

"6. Multiply the percentage of quartz by bulk, (which must be 66.65 since that of the gold is 33.35) by its specific gravity. The product is the ratio of the quartz in the lump by weight: 66.65x2,60=173,29.

"7. To find the percentage, add these two ratios together, and proceed by the rule of proportion: 633,65:173,29=806,94. Then as 806,94 is to 633,65, so is 100 to 78,53. Hence a lump of auriferous quartz, having a specific gravity of 8,067, contains 78.73 per cent. of gold by weight."

To find the specific gravity of a lump of gold quartz, or auriferous quartz, divide the weight of the lump in air by the weight of an equal amount of water. To find the weight of an equal amount of water, deduct the weight of the lump in water from the weight of the lump in air. When the lump is to be weighed in water it should be suspended by a horse-hair so as to hang into the water; keeping, of course, all other parts of the scales clear of the water.

Discovery of a New Substance in the Atmosphere.

A writer in the *National Intelligencer* states that the theory of Mr. Clemson, head of the Agricultural Department of the Patent Office, of living organisms in the atmosphere, which he made public in 1856, has been adopted by a French chemist named Barrel, and announced to the French Academy. Mr. Clemson's theory is that the air, like water, teems with minute living organisms—that there is phosphoric acid in the air, derived from the successive generations after generations of myriads of these organisms, produced, living and dying in the atmosphere; that such organisms exist, and are at work, assimilating from one to the other, preparing food for more perfect organism, from the microscopic point of life up to the most perfect animal existences. It is expected that this discovery will explain why the earth is increasing in fertility by being broken up and exposed to the air. It connects meteorology with agriculture, and will, when fully developed, open a new page to the learned of the relation of the spots on the sun, the degree of fertility of the earth, and electrical changes of the atmosphere and magnetical condition of the earth.

CALIFORNIA WINE.

CARD.

LAKE VINEYARD, Los Angeles County, Cal., }
March 21, 1861. }

BEING OFTEN APPLIED TO BY ACQUAINTANCES THROUGHOUT THE State for my Wine in small quantities, I hereby notify them, as well as the public generally, THAT I HAVE APPOINTED

Messrs. Hobbs, Gilmore & Co., of San Francisco,
MY SOLE AND EXCLUSIVE AGENTS

For the State of California, for the sale of all the different classes of Wine manufactured by me at Lake Vineyard (and that they cannot be obtained of any other parties) giving the assurance that they will obtain from them the same article in every respect as I have in my cellars B. D. WILSON.

NOTICE.

In conformity with the above card, the public are informed that we, the subscribers, have for sale, at our

WINE CELLARS,

Southeast corner Market and Beale Streets,

Nearly opposite the Railroad Depot,

PURE WINES,

CONSISTING OF

Port, Angelica and White Wine

All warranted to be the pure juice of the grape.

Which we will sell in quantities to suit purchasers, put up in shipping packages, or otherwise.

my23 HOBBS, GILMORE & CO.,
Market street, opposite the Railroad Depot.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved

AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz.

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as mixed with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required. The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee, J. B. BEERS

Ma15 165 Clay street,

WE ARE NOW PREPARED TO RECEIVE GUESTS

—AT OUR—

NEW SALOON,

327 Montgomery street, TUCKER'S BUILDING,

—FOR—

BREAKFAST, LUNCH, AND SUPPERS,

Where will also be kept on hand every variety of CONFECTIONERY, JELLIES, ICES, PASTRY, CAKES and BREAD. Our Manufactory is on the premises, where we make every article sold from our counter. We are prepared to furnish Balls, Weddings, Reception Parties, or Families, with every article desired, in small or large quantities. All will find it to their advantage to examine our goods, as they will find them manufactured from the very best material, and with utmost care, and sold at reasonable prices. The Manufacturing Department is under my own immediate supervision, and having had over twenty years' experience in our business, we feel much confidence that we shall please the public. All goods sent free of charge. my24 JNO. J. HALEY.

TEETH! TEETH! Extracting without Pain! Dr. W. H. JAWN, Dentist, Third street, near Howard (opposite Estlin's Mansion) All branches of Dentistry performed in the neatest manner.

Extracting, each, \$1.
Extracting children's teeth, 50 cents.
Filling with gold, each, \$1, \$2 and \$3.
Filling with platinum cement, \$1, \$2 and \$3.
Cleaning, whitening and harnessing, \$2, \$3 and \$5.
Straightening, etc., from \$2 to \$5.
Nerves killed and Toothache cured, \$1.
Whole or partial sets nicely and firmly adjusted on the finest gold, at from (each tooth) \$5 to \$10.

On the best silver plate (each tooth) \$3 to \$5.
Montgomery street Omnibuses pass the office every five minutes. Special attention paid to Children's Teeth. Circulars, giving full directions to parents for the preservation of Children's Teeth. Remember the Place—Third street, near Howard.

mhl W. H. IRWIN, M. D.

CALIFORNIA COAL MINING COMPANY.

CAPITAL, \$5,000,000

IN 50,000 SHARES.

THE BOARD OF DIRECTORS and Trustees of the California Coal Mining Company, give notice to all parties disposed to invest in the Stock of the Company, that Ten Thousand Shares, of \$100 each, of the said Stock are reserved for that Purpose, by resolution of the Board.

The Books of Subscription are open at the office of Piche & Bayerque, where the required first instalment of 10 per cent. will be received.

F. L. A. PICHÉ, President.

m28 J. H. APPLEGATE, Secretary.

AGENCY FOR PATENTS.—The undersigned having been long established in the Patent Agency Business, and having favorable arrangements for attending to the interests of inventors at the Patent Office in Washington, offer their services for the securing of Caveats and Patents also, will attend to the sales of Patent Rights, and to all matters connected with patented inventions.

WETHERED & TIFFANY,

Office, Market street opposite Montgomery

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY JUNE 8, 1861

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$1 per annum, in advance.

Advertisements, Fifty Cents per line.

Quicksilver.

We well remember the time—not many years ago—when, in the Northern mines, quicksilver cost us \$1, \$2, and even \$5 per pound; and somewhat polluted by lead, too. It is now some five years since we swung the drifter's pick, and much more since we delved in placer diggings, and we are not aware of the price that invaluable gold-catcher is now held at in the mines; but judging from city prices, and allowing a reasonable profit to country dealers, it seems fair to suppose that it is retailed at 45@50 cents per pound to miners—a great reduction of price in so short a space of time! This is occasioned of course, by the many recent discoveries of rich cinnabar in various portions of our prolific State, and in spite of the long stoppage of the great New Almaden mine, owing to tedious and vexatious litigation. This mine, however, is at last in full operation again, and its annual product of over 1,000,000 lbs. of quicksilver will again be in the market. The New Almaden, New Idria, Enriquita, and Guadalupe mines of Santa Clara county, with the many recently discovered and only partially worked cinnabar veins of Napa and Sonoma counties, (which contain liquid quicksilver,) already turn out some 4,000,000 lbs. of quicksilver per annum—an amount nearly large enough to supply the world—and doubtless when these latter shall have been more thoroughly opened, the yield will reach the high figure of 8,000,000 lbs., the value of which, at the rate of 30 cts. per lb. would be no less than \$2,400,000: and this we think is a moderate estimate. Hittell sets the average aggregate annual yield of the four great Santa Clara mines at 3,510,000 lbs., but it has reached as high as 4,275,000 lbs.—and as they are by no means worked to the best advantage, we may safely look for largely increased returns as the operations of the companies are extended. Lack of experience, money, and harassing litigation, heretofore have very much retarded these operations; and we shall not be at all surprised, if, within the next ten years, the annual yield from Santa Clara, doubles itself. If the accounts of discoveries in Napa and Sonoma counties approach the truth, then we have a still richer district there, whose yield can hardly be computed. Accounts recently received from Washoe also speak of rich cinnabar veins discovered. We hope the reports are true. With so many mines and such vast yields, we may safely predict that the wholesale price of quicksilver will constantly decrease until it reaches 8 or 10 cts. per lb. Quicksilver will then be used with a more liberal hand in the search for gold and silver, and many other advantages to the world will arise from its cheapness.

State Prison Contracts.

The Board of Directors of the State Prison have entered upon a new line of policy—that of leasing prison labor to various contractors for mechanical purposes. The largest contractor is Thos. Ogg Shaw, Esq., of this city. He has signed a contract with the authorities, whereby they agree to furnish him the labor of one hundred prisoners, for the period of five years—fifty to be mechanics and fifty common laborers, who will be employed to manufacture agricultural implements, &c.; and for such labor he agrees to pay the State seventy-five cents a day for the mechanics, and thirty-seven and a half cents for the common laborers, for whom too he will erect a two story brick building, 160 by 80 feet in size, upon the State Prison grounds at San Quentin.

Mr. E. T. Pease has also made a contract with the Directors for fifty prisoners for one year, for whose labor he pays fifty cents a day—the State to feed, cloth, furnish workshops and guard them. These will likewise be employed in mechanical pursuits. We are glad that these contracts have been made. It is a popular but erroneous idea that the labor of our State prisoners will thus be brought into ruinous competition with that of other California manufacturers; in reality it will only interfere with our importations—a very desirable effect, when we consider that in this way our State Prison will be made self-sustaining, and the burden of taxation upon our citizens materially diminished.

WOOL GROWING AT THE SANDWICH ISLANDS.—We learn, says the *Advertiser*, that the grazing establishments of Messrs. Louzada, Spencer & Co., and Ropt. C. Janion, at Waimea, Hawaii, have been united, and that the new concern is now called the Waimea Grazing and Agricultural Company, of which Mr. W. L. Green is President and Director in Honolulu, Mr. Geo. McLean is Secretary and Treasurer, and Mr. Francis Spencer is Manager on Hawaii. They purpose to apply for a charter, with a capital of \$75,000, and as they own some fifteen thousand fine wool sheep, six or seven hundred head of cattle, beside the wild mountain herd, estimated at 20,000, and are in possession either by lease or in fee simple of a tract of land stretching from sea to sea across the island of Hawaii, and around the mountain of Maunakea, this company becomes perhaps the largest and most important of the several joint stock associations recently formed here.

The *Polynesian* of May 18th, contains an article on the subject of wool growing. Says our contemporary: We rejoice to see the increased attention which our graziers are paying to the raising of sheep, and that wool growing is rapidly increasing. The better care now bestowed upon the washing, assorting and packing of the wool, while it obviates many of the objections formerly made to it, greatly enhances its value. If we look back upon the doings of former years, we shall find the first export of Hawaiian wool recorded in 1845, when eight hundred pounds were shipped. From 1845 to 1854 the shipments of wool had only increased to 12,845 lbs. Since then, wool has taken a fine start; the breed has been carefully improved and the flocks better attended to; and in 1860, the clip exported was 70,524 pounds, while up to May, 1861, already 74,075 pounds have been shipped, 70,434 pounds of which went in one vessel alone, to Bremen, while many of the graziers have not yet finished shearing and packing their wool.

LARGE SHIPMENT.—In our issue of the 26th, after alluding to the decrease of treasure shipments per ocean steamer for the East, owing to the alarm raised in the minds of our monied men by rumors of the fitting out of Southern Confederacy privateers, designed to capture Californian steamers and treasure, we predicted that those alarms would subside and the next shipment be very large. The prediction was verified; for the next steamer, (of the 3rd June), took away \$1,174,936.08, being the largest shipment made this year, with one exception, viz, Jan. 11, when the large amount of \$1,446,936.77, was taken Eastward. To render life and treasure still more secure, the steamers are being even more thoroughly armed.

VALUABLE BOOKS.—We have received from Geo. W. Guthrie, Esq., vol. XII of "Explorations and Surveys for a Railroad Route from the Mississippi River to the Pacific Ocean," by the Hon. Isaac J. Stevens—an invaluable work, interspersed with splendid colored lithographic illustrations; also from H. H. Bancroft & Co., a work entitled "Sonora," being a translation by Wm. F. Nye, from the Spanish of Francisco Velasco, and treating in a clear, comprehensive and pleasing style, of the extent, population, natural productions, mineral and agricultural resources of that State, with brief histories of the Indian tribes found within its borders.

A GRAND RAILROAD PROJECT.—General Angel Trias, late Governor of the flourishing State of Chihuahua, in Mexico, recently arrived in this city, en route for England, whither he goes to make arrangements and procure material for the construction of a grand railroad from Mexico to the Eastern States of the Union—an international railroad as it were: Were Mexico covered by railroads, her government would be durable.

BIRTHDAY.—It is just one year since the Marysville *Appeal*, one of the ablest and least rancorous of any partisan papers we ever read, commenced its Republican career. Its impartial and dignified course, if imitated by other political papers in this State, would render the Press of California distinguished for propriety of conduct and tone.

THE VALLEJO BRAND.—The only agents for the celebrated red, white and sparkling wines of the Lachryma Monte Viueyard (belonging to Gen. Vallejo) Sonoma county, are A. S. Lowndes & Co., 617 Montgomery street, opposite Montgomery Block.

MAGAZINES.—The *Expositor* and California *Mountaineer*, for the month of June, have reached our sanctum, and we judge from a hasty glance at their contents, that the June numbers of both those excellent mouthpieces are exceedingly attractive.

COMPLIMENTARY.—Rev. Dr. H. M. Bien lectures to night; subject, "Europe and Europeans"—matter for Master Minds. We acknowledge the receipt of an admission ticket.

The City of Rocks.

A writer in the Vancouver *Chronicle* thus beautifully alludes to the "City of Rocks," familiar to all who have traveled across the plains to this coast.

City Rocks are justly considered one of the greatest curiosities of the plains. Looking from an elevated point at the distance of several miles, they present the appearance of a large, well-built Mahomedan city, with its towers and minarets penetrating the clouds; and while the gray sides of the granite spires reflected the golden rays of the declining sun, it was not difficult for the imagination to realize one of those gorgeous pictures which Oriental painters delight to present to the gaze of an admiring world. A nearer approach converted the Turkish city into a well built walled city, with its castles and gateways of fendal times. But once within the outer wall, and no effort of the imagination was requisite to satisfy the mind that you were by an impregnable fortress, from the turrets and loopholes of which a few resolute men could resist an immense army. The scattering house-shaped rocks looked like officer's quarters in a well-appointed fort. So natural were these views, that we could scarce realize, while surrounded by the colossal columns and magnificent archways of this wonderful work of nature, that these apparent tenements were not inhabited—that cold stone only, instead of a teeming garrison or city surrounded us. Then it became to us a City of the Dead. A Maison Carre or a Greenwood, with their magnificent monuments, loomed up before us. But no work of art could equal the magnificent proportions of the spiral columns of the City of Rocks.

SOUNDS UNDER WATER.—Any one who has been accustomed to diving must have discovered that when the body is entirely submerged in the water, the auditory organs are very sensitive to sounds which are conveyed through the water, though not to those which are produced on land, and are only transmitted through the upper atmosphere. For example, although when a man is entirely submerged he is unable to hear the loudest shouts that can be raised on shore, his ears are almost painfully sensitive to any sound that is produced in the water and is transmitted through its mediumship. A stone thrown into the water, or a blow upon its surface, is heard with perfect distinctness, while the measured stroke of oars and their peculiar grinding roll in the rowlocks become perceptible to his ears long before the sound is audible to those who are on land.

SILVER IN ABUNDANCE.—From certain correspondence in the London *Times* we learn that the recent discovery of oxyd of silver in a natural state—which until recently was believed not to exist—will produce a yield of silver absolutely enormous in comparison with what has hitherto been obtained from ordinary metallic silver deposits. In a tun of ore, in its natural state, where the normal yield would be 13 ounces, this new discovery will produce an average yield of 113 ounces! the additional one hundred ounces being obtained from what has heretofore been deemed useless. Its importance to our mines, where silver is often found in close proximity with copper and other metals, will be very great; whilst in cases where the deposit is great and unmixed with other metals, the returns will be almost fabulous—the cost of working being absolutely trifling.

DEPOSITS OF CHALK AND CEMENT.—Some parties, says the *Territorial Enterprise*, have found a splendid bed of chalk about ten miles from this place, on the new road to the Truckee Meadows. Some specimens of it have been tried by our carpenters, and found to be fully equal to the imported article.

Several lime kilns are erected in the vicinity of American Flat. The quality of the rock obtained there is excellent. A kind of cement is also found in the neighborhood of the chalk hill which makes splendid plastering for houses, taking but a short time to harden, and adhering to a wall with greater tenacity than lime mortar.

VALUE OF TIMBER AND WATER IN WASHOE.—Since the value of our mines has been demonstrated beyond a question, the increase in the value of timber tracts and water privileges has been very great. Water privileges which a year since would not command hundreds, now command thousands of dollars, and almost every available stream in the Territory is now claimed by somebody, in many instances by a number of claimants. Timber tracts are being closed in, and where enough water can be obtained to fill a boiler, a steam mill in a short time adorns the tract. The timber and water tracts will, we think, in a few years, be the real valuable investment of the country.

EXECUTION.—Last Tuesday, in the yard of the county jail, John Clarkson, a negro who some months ago committed a most diabolical and cold blooded murder, was hung. The murderer's victim was a beautiful young mulatto girl, named Caroline A. Park, who was at the time a servant in the house of Mr. Fred A. Woodworth of this city.

MONGOLIAN ENLIGHTENMENT.—The Prince of Kung, says the Hongkong *Register*, had ordered the institution of a college for the study of English and French at Peking. It is one sign that the Chinese Court is now convinced of the necessity of cultivating more intimate relations with foreign nations.

SUMMARY OF MINING NEWS.

CALIFORNIA.

Nevada County.—The Club and Whiskey Diggins, says the San Francisco Press, located on the Middle Yuba, at Hotfield's Crossing, and owned by Jacob Knause, Jack Pollard, Win. Heath and others, in which rich dirt was struck not long ago, it is said are paying splendidly. Last week four men were engaged in digging, and in a day and a half they had raised about \$100. The climate is getting richer as the drifts reach further into the bank. . . . From the Nevada National we gather no Grass Valley mining news, save that it is continuing in this extract: "Everybody is full of energy and hope. . . . The new town organization, new planned streets, and busy bustling population, give an unusual air of vitality to everything around. Our miners, both quartz and placer, were never doing better; mechanics have all they can do, and lawyers don't complain for lack of clients. Doctors and the only professional gentry who look anxiously around for custom. Their patients, owing to the preëminent healthfulness of our mountain climate, are becoming somewhat scarce. The only man who is believed in the permanency and continued prosperity of our healthful village, has left town, departing for parts unknown. . . . The Eureka Mining Company, says the Call, purchased 700 kegs of powder in this city one day last week, to be used in their claims for blasting in gravel cement, which cannot be washed until it is made loose by the operation of blasting. This company is taking out about \$800 daily, with fair prospects of an increase to double that amount soon. They use about one hundred kegs of powder monthly, or fifty to sixty kegs at a blast, producing at each a young earthquake."

Contra Costa.—The annual consumption of coal in California, says the Contra Costa Gazette, cannot fall much short of 80,000 tons; and the larger portion of this amount has been hitherto imported from abroad. The Cumberland Company is now taking out of their mine, at Mount Diablo, about thirty tons daily. The Clark Chimney averages about forty tons a day. The Adams and Black Diamond Companies must average twenty tons a day. In each of their mines, we presume, and the Pioneer Company is said to be also at work, taking out, perhaps, some ten or twelve tons. All these together will amount to one hundred and twenty tons daily. But it is to be considered that so soon as the proper roads are completed, and the shafts put in proper working order, four or five times as much as at present can then be daily thrown into market. Indeed, those interested say that in six months, five hundred tons daily can and will be brought out of those mines. At our former estimate half the present demand of the State will be supplied at the present rate of production. If the latter estimate of what will be done be correct, then our miners will furnish twice as much as the present rate of demand. It is plain, however, that with the increase of supply will come the decrease of price, and in the same proportion again will follow the increase of demand for a still further supply.

Plumas County.—From correspondence in the Standard, we learn that on North Fork the miners are doing unusually well. . . . New hill digging have been struck at Rush Creek, causing great excitement in that locality. Several tunnels have been run during the winter and spring, at different elevations; and the upper tunnel, at the head of the gulch, was conducted straight to date, and was found to be extremely rich, upwards of sixteen hundred dollars being taken out, on the bed rock before the channel was reached. All the ground along the gulch and adjacent thereto, is staked off into claims. Six or eight tunnels more will be run this summer, and several are already commenced. . . . At Dutch Hill the boys are taking out the rocks abundantly. . . . At Red Rock the miners are doing well. The men at work on the upper claim, took out last week one hundred and eighty tons of rock, and claim they took out more than that in the present rate of production. . . . The Niart & Co., at Humbug Valley, have extensive diggings about one mile north of Miller and Kingsley's store. Their claims have been thoroughly prospected, and known to yield good pay. In fact, from every quarter of the county where any considerable amount of work has been judiciously applied, the reports are unusually encouraging; and years hence, when Plumas county shall receive something like a fair prospecting, it will undoubtedly prove to be one of the richest mining counties in the State.

Sonoma County.—The editor of the Central Californian has been shown a specimen of quicksilver ore from Sonoma county, which yields about one ounce of quicksilver to every pound of ore. The quicksilver mines discovered some months since in the vicinity of the Geysers, in Napa and Sonoma counties, it appears are destined to be of great value. The other day, says the Call, we saw several very rich specimens of cinabar, as well as rock containing quicksilver in its purity, and a large lot of quicksilver, all taken from the Pioneer Mine one of the first located. This mine has recently fallen into the hands of capitalists in this city, who have commenced operations on it with energy. They have employed a large number of men, which they have already penetrated several hundred yards. The lead of cinabar is several feet thick and of an unknown depth, and the owners of the mine feel confident that where it is fairly opened they will be able to turn out several hundred flasks of quicksilver weekly.

Del Norte County.—We are glad to observe, says the Crescent City Herald of May 25th, that there is more attention beginning to be paid to prospecting for gold quartz leads in this vicinity. The lead on the Bald Hill, owned by Messrs. Volander, Mullin and others, is being opened with a view of thoroughly testing it. Many of the specimens taken out have the precious metal plainly visible to the naked eye. Messrs. Wenger and Richert are opening another lead in the same vicinity, which as far as trial promises to pay well. We have also been shown some quartz by Ben Reynolds, Esq., from a lead of which we do not know the exact locality, which has the appearance of being gold-bearing. If proper exertions are used, we feel confident that the present summer will prove a very successful one for the rich quartz leads in this county. The same paper has recently given good accounts of the mining at Big Flat, where there are now ten men at work. Two of them took out thirty ounces in three weeks.

Yolo County.—Last Saturday, says the Marysville Appeal, Messrs. McAllis, Stewart & Co., proprietors of the Michigan claim, Timbuctoo, cleaned up \$5,944, after a run of nine and a quarter days. And this is not all for Mr. Stewart has a long tail-race from the same claim, from which he took out \$1,800 at the same time, after a run of fifteen days. The prospects of the Michigan company are just as good as what they have already realized, having taken out in the past six months \$49,000.

Colorado Mines.—The Hydraulic Press tells of the return to the San Juan of five citizens of that place, who went to the Colorado mines last winter, during the prevalence of the Potato fever. Two of them have already declared their intention of going back to the Colorado mines sometime during the summer. . . . The Sonora Age also mentions the return of an old resident of Tuolumne county, from the Potosi silver mines, who reports favorably of the prospects in that part of the country.

Sacramento.—The Bee says that Chas. Newman arrived in Sacramento City, last Saturday, bringing with him as a specimen of what is to be found at and about Gold Hill, in Nevada Territory, \$28,000 in silver bullion and several bags of the richest kinds of silver ore. The treasure has been at Hastings' Bank, in this city, and been admired by hundreds of persons who consider the sight of such things good for sore eyes.

Tuolumne County.—The Courier informs us that a beautiful chunk of gold was taken out of the Casado claim, at the foot of Main street, Columbia, on Monday week. It weighed upwards of two pounds, and was valued at about four hundred dollars.

NEVADA TERRITORY.

Washoe District.—From the Washoe Times and Territorial Enterprise we condense the following information: Cinabar has been discovered within a few miles of Silver City, which has been satisfactorily tested; arrangements are now making to open the mine, and should it prove as rich as the discoverers deem it, they will be lucky fellows. . . . The boys at work on the Cheanago ledge have opened the vein on the top of the hill, and find it fully as rich and much thicker (about four feet) than where first opened. . . . Some very fine pieces of silver ore from the Oakland ledge have been shown to us during the week, some of which we saw as high as \$500 to the ton. There is some danger of the boys' "striking the Constock." . . . Mr. John M. Moore, Superintendent of the Succor Claim, has lately arrived from San Francisco, and is making arrangements for working the mine. . . . About seventy-five stamps are being made night and day hideons in Silver City and immediate vicinity. . . . Logan & Holmes are rapidly advancing in their work of putting up a fine forty-stamp mill on Carson river. Dr. Hastings has his mill building nearly completed, and is daily expecting his machinery

"Over the mountains." Keller is digging a race and getting the lumber on the ground for a mill. Mosheimer & Co. have been erecting additional works. Carson river presents quite a busy appearance. . . . Mr. L. S. Bowers of Gold Hill, has left for San Francisco in order to purchase machinery for a quartz mill to be erected at or near that place. . . . Three men engaged in placer mining near Washoe Lake, took out seventeen ounces of gold worth sixteen dollars per ounce, as the reward of last week's labor. . . . In the canon below Johnston there are six companies at work, all of them making big wages—about five dollars a day to the hand. Messrs. Trinch & Wood are bringing water in a ditch, from the neighborhood of the Blue Sulphur Springs to their mill, which will flow down the canon and furnish water for the entire year. Several miners who left those diggings some years since are returning, believing that they are as rich as any they have found in California. . . . At Washoe Valley, the placer diggings are quite rich. The American company took out on Friday last, 334 lbs. of silver, in silver, and the proceeds of nine days' work amounted to over \$900. The value of the gold ranges from \$17.25 to \$20 per ounce. Mr. Baird, the original discoverer of these diggings, while on a prospecting tour, recently discovered some very extensive surface and hill diggings, about four miles west of Washoe Valley, which he believes will far excel the latter in richness, though they will require more labor to prospect them. The region of the new discovery somewhat resembles the gravel ranges of California, and extends about four miles. The Ophir Company last week shipped from their works at Washoe Valley, four hundred and eighty pounds of bullion, worth about thirty dollars per pound—the proceeds of three days' work. The company now have their works fairly in operation. . . . The North American Company, which is located in Spanish Ravine, about one and a half miles east of Silver City, lately had fifty tons of their rock crushed at the mill of Burke & Co., which yielded \$2,500. The ledge is about three feet thick, and as it is not in the face of the hill, it is not so easily worked, and they practically working near, great results may be expected from it. Hastings & Co., bankers of Sacramento, received on Monday last, from New, Harold & Harrison, Gold Hill, Nevada Territory, several silver bars, valued in the aggregate at about \$18,000. They came from the assaying office of Rhuland & Co., and although, to all appearance, pure silver, they contain in fact of value a still greater amount of gold. The weight and value of the bars were as follows: 31,428 lbs. in gold and \$34,450 in silver; 757.24 lbs. in gold and \$917.05 in silver; 800.00 lbs. in gold and \$1,401.37 in silver; 594.05 lbs. in silver; 718.05 ounces, \$2,226.62 in gold and \$773.37 in silver; 752.67 ounces, \$1,060.14 in gold and \$835.80 in silver; 692.46 ounces, \$1,918.11 in gold and \$760.11 in silver; 569.20 ounces, \$1,494.32 in gold and \$631.41 in silver. . . . The Washoe Times (Silver City) says: "A fine appearance specimen of cinabar, from a ledge within a few miles of Silver City, was shown to us during the week. Our informant says that it has been tested in several different ways, all of which gave a fine result in mercury. Arrangements are now being made to open the mine, and should it prove as rich as the discoverers deem it, they will have been lucky fellows. A large amount of quicksilver is used for amalgamating purposes in our mills, and the demand will be constantly increasing."

Emerald District.—A correspondent, writing from Aurora, on the 28th May, to the Bulletin, says: "The hills in every direction are covered with men intent upon opening old ledges and discovering new ones. During the day, the town seems entirely deserted; but at night the different saloons are crowded, especially on stage nights. We had great rejoicing here last Thursday, when the first quartz mill of the district made its appearance. A large force is employed in its erection, and before many days a long-expected community will be able to hear the music of its whistle, and the incessant thump thump of the stamps. There are thousands of tons of quartz, which lie on the surface, that will pay from \$500 to \$1,000 a ton. Parties have been at work for the last thirty days, blasting and collecting surface rock, to be crushed at the mill. But a short time will now elapse before some of our California friends will be enabled to prove of their worth. The completion of the Emerald Discovery Tunnel has been given to J. J. Kyle, the contractor, who has been running the north and south tunnels all the past winter. These three tunnels, representing the outlay of over \$30,000, are being carried on day and night. The discovery claim has only about fifteen feet further to run. Work has been commenced within the last two weeks on the Winnemacua, Cape, La Plata, Santa Fe, and in fact in nearly all the prominent claims in the district—the last of June being the time set by the district laws for work to commence, or claims become forfeited."

Genoa District.—A correspondent of the Alta writes from Genoa, June 1st, that the Genoa district is possibly yielding silver. It has been found about five miles south of Genoa, on the headwaters of the eastern branch of the Carson river. They have found there a vein of quartz rock, three hundred and fifty feet thick, cropping above the surface from fifty to one hundred feet. Specimens of this immense ledge have been brought to Genoa, and assays made. The result shows about \$150 per ton in silver, and a very small quantity of gold. The mining operations in the Genoa district, I am glad to say, are now on a new footing. As to mining operations, the operations of the organized companies display great confidence in the mines here, and energy on the part of the various companies. The Sierra Company, in particular, prosecute their extensive work with great vigor. Last week they purchased a valuable mill site from R. N. Allee, and already some six or eight men are at work, preparing the timbers for an extensive saw mill. The company owns some 2,000 acres of timber land.

Wisconsin District.—In running tunnels for the purpose of prospecting various leads in Blue Sulphur Spring District, veins of water have been tapped, and we understand that parties here have taken steps to secure this most necessary element, and by means of pipes and ditches, conduct it to this city. This will be a good stroke for our mills. . . . The Editor of the Times has just seen a most splendid specimen of gold bearing quartz from the Humboldt mines, but was unable to learn what ledge it was out of. . . . The placer mines of Wisconsin district are paying well. We learn that the American Company, working four men, made from one to two and a half ounces per day to the man last week—going with \$1,000 a week, and it is expected to be washed. Several companies are at work in this district with good prospects.

Coso District.—Dr. Dewey, formerly a resident of Stockton, arrived yesterday from a mining district twelve miles east of Coso, with numerous specimens of ore very rich in gold and silver. He exhibited to the editor of the Republican, specimens of antimonial silver, very rich, from the Bailey lead, Washington District; and from the Wilber lead, same district, specimens of red sulphurets of silver, also rich. Also specimens of gold bearing quartz from Whishick and Potosi leads, Coso district. About six hundred pounds of silver ore is above named, in now on the way to San Francisco. The Doctor is now in San Francisco to make arrangements to ship machinery preparatory to working the mines on an extensive scale.

Mount Pleasant District.—New and apparently extensive placer diggings have been struck in the Sierras, south-west of Washoe Lake. These mines are situated some four miles further up in the mountains than those at present being worked in Wisconsin district, and are supposed to be equally as rich. A new district has been formed called Mount Pleasant; and Sierra Diggins is to be the name of the present mining camp. Good prospects are showing immediately on the surface. There is plenty of water, and both hill and ravine diggings.

Owen District.—The Visalia Delta says that a new mining district has just been discovered by Col. Russ of the New World Exploring Expedition. It embraces a large extent of country, and covers seven miles. In the course of a few days several tons of the ore will pass through Visalia on its way to San Francisco, where it will be tested. The Doctor is confident that the ore is very rich.

Flowery District.—This district, says a Washoe exchange, is awakening in her slumbers. Claims in that region are being rapidly developed, since it has become a fixed fact that mills for the reduction of gold and silver ores are to be erected. Flowery can show rock that is hard to be beat. Success to her and her mills.

Humboldt District.—The returns from the Humboldt country are very flattering. We have been shown some specimens from the Cuba ledge in Prince Royal Canon, in which gold can be seen in large quantities with the naked eye. The travel to that section is rapidly increasing, parties leaving there almost every day.

OREGON AND WASHINGTON.

The editor of the Crescent City Herald has recently been in Southern Oregon, and says that the present topic of interest at present in Jackson and Josephine is the quartz leads, more of which are being discovered every day about Jackson, Applegate, Calico, Altshouse, and other creeks, and many

of which prospect to pay very richly. In many of the localities where both quartz and placer mining could be carried on, the scarcity of water is a great drawback, and difficulties will before long be from necessity brought in to obviate it. . . . A correspondent writes from the Nez Perces mines on the 12th ult., to the Portland Advertiser, saying: "There is none of the country yet, so far as has been prospected, but what they can get gold. Every claim that is fairly opened is paying well—from sixteen dollars to sixty-four a day. A day's digging here will clear up a man from the Nez Perces mines on the 12th ult. to four men. The Boston Claim, on Oro Fino, is paying \$100 a day to three hands. As I said in my last that as soon as the snow went away they would find dry diggings, they have found them, and plenty of them. Every bill in this vicinity pays good wages—twenty cents to the man. I washed out a pan myself, and got twelve cents (and I know I am not expert). It is still rather soon to work the mines to any advantage. You may look out for there to be a great mine started over there on a prospecting tour. . . . There was considerable dust brought down by private hands—say about \$2,000 or more. I brought down eighty letters, all prepaid. I took a trip over to the new town called Forkville. It already contains twenty four log houses. I think that Geo. E. Cole will move over there; it is more central than this place. I think that before two months there will be enough dust come down to convince even the most incredulous. I have not seen a fair sensible man yet, who has been to the mines, but what was satisfied. Wages here per day is five dollars, and cannot get enough land at that. . . . A rich quartz lead has been discovered on Squaw Creek in Jackson county, Oregon, which yielded as far as prospected \$2,000 per ton. . . . The report that the celebrated Applegate Quartz Lead, near Jacksonville, Oregon, had run out, is false, for the Sentinel says that the company have cleaned up three hundred and two ounces of pure gold from a run of their arrastras for three weeks."

Nez Perces District.—The correspondent of the Bulletin, writing from Portland, Oregon, May 17th, says: "A number of California miners, sometime ago, passed through this city en route for the Nez Perces mining region, with a view of spending the present summer prospecting in that new and unexplored region of country, and judging from the reports they must have met with satisfactory results. I learn by persons who arrived in this city on Tuesday evening last, that from \$4,000 to \$5,000 of dust was now being taken out daily, and that amount by a few companies only who had commenced work. A large number of companies, however, would soon be in operation. It is also stated that a large amount of dust is now in the hands of the miners, waiting purchasers. . . . Since writing the above, the steamer Julia has arrived from the Cascades, bringing news of a most flattering character from those mines. Everything seems to prove exceedingly rich in that quarter."

AUSTRALIA.

From Australia we have dates to March 22d:

At Benlago recently, according to the Advertiser, the window of the Orient Bank contained an exhibition of some of the richest quartz that has ever been seen in the colony. They were taken from the claim of the Catherine Reef Quartz Mining Company (late Keith's) on the Catherine Reef. Some idea of the stone may be gathered when we state that although there was scarcely a bucketful of quartz, they were estimated to contain upwards of 260 ounces of gold. One piece alone, about the size of a man's hand, contained about thirty ounces of gold. It is expected that the returns from this new celebrated reef will eclipse the far-famed Johnson's reef Victoria, in their day. The days of the quartz, with hardly an exception, was of a dead-white color, mixed with a slaty piece. This struck me as being a new discovery."

A correspondent of the Clarence and Richmond Examiner writes from the Clarence River Gold Fields: "I have just arrived on these diggings, after paying a visit to almost every gold field in the colony, and I do believe that Timbarra and its neighborhood is one of the richest gold fields in New South Wales, but as yet untried. As for these diggings being worked out, it is all nonsense. The richness of the country from Tabularian up to Timbarra, is a gold-bearing country, more or less, and in some places the surface has been disturbed; therefore, the country remains untried. On our way up to Timbarra, for curiosity's sake, we washed several dishes of dirt from the different creeks, and in almost every instance could get a few specks, but in none of these did we reach the bed rock."

The Sydney Herald states that an important discovery has been recently made at Queensland. A copper mine of great richness has been found on the Forbach Station, the property of Capt. O'Connell, about thirty miles from Gladstone, on the banks of one of the tributaries of the Burnett River. A trench of forty feet has been cut, and the vein there is three feet in width. Another monster nugget had been found at the Bendigo diggings, in a euphonious place called Dead Bullock Gully. The nugget was found in old ground that had probably been turned over innumerable times before. It weighed 377 oz., 67 1/2 grs. of pure gold as ever came out of the ground. The finders are Mr. and Mrs. K. K. K.

A correspondent of the Alta says: "In mining, affairs are not satisfactory, although quartz mining has been steadily persevered in; as much as six or seven ounces to the ton has been frequently realized, and in one instance 1,197 ounces had been obtained from 185 tons of quartz from a claim on the Columbian Reef, at Laglewood. The escort brings down about 30,000 ounces a week, against 35,000 last year."

MEXICO.

Sinaloa.—A correspondent of the Appeal writes from Mazatlan, May 19th, as follows: "Considerable excitement has existed here for the past two weeks, on account of very rich copper diggings being found some 300 miles in the interior of Sinaloa. At last accounts about 1600 natives and 30 Americans were at work. Yesterday a gentleman arrived from there, who states that it has been known to the Mexicans in that vicinity for several years that gold existed in considerable quantities; but it was never worked, except by picking over the surface during the rainy season, when men, women and children are engaged in looking for the precious metal. One piece is said to have been found weighing near twenty ounces. Specimens have been shown here and there, which were brought from there, weights and measures to test the gold. The rainy season is from June to November, and during that time water is sufficient quantities is easily obtained. I have not yet been able to learn whether it is practicable to conduct water on to the ground by a ditch, but it is reported that plenty can be obtained by running six miles in good ground. I would not advise any one to rely too much on the truth of this statement, although I have such confidence in the mines as to go there myself. I will leave to know with a party of Americans, and as soon as I can I will report to you the success of my trip. The distance from this place to the mines is about the same by land or water. I intend going by land, so as to see the country, as the trail is said to be good. Mining implements are not to be had here, in quantity. Mules are worth from twenty to forty dollars, and living, 'a la Mexicana,' is cheap all through the country."

BRITISH COLUMBIA.

From the British Colonist we make a few extracts of mining intelligence: C. B. Young of the Esperanza Silver Mining Company, on Harrison Lake brings a large number of choice specimens of silver ore, and reports that the veins seem to increase in richness as they proceed. Three openings into the base of the quartz leads have been made—one of which is about 20 or 30 feet out, and another some 45 feet.

The Governor has appropriated \$1,000 toward improving the route from Cayceash to the upper country. The citizens have subscribed \$1,500 in addition to a previous sum. The contemplated improvements will shorten the trail from forty to sixty miles.

The last news from Caribosetas that miners are making from fifty to one hundred and fifty dollars a day to the man, and were paying men from eight to ten dollars a day, and finding them. New diggings have been struck on a tributary of Swamp River, known as Cunningham's Creek.

The news from Similkameen and Rock Creek was not encouraging. There were vague reports of a stampede from these localities to Cariboo.

The Hope Silver Mining Company are preparing for working their new vein on an extensive scale.

From Yale no later mining news has been received.

JAPAN.

The only mining news recently received from this out-of-the-way country is to the effect that its gold, silver and copper mines are entirely monopolized by the Japanese Government, and worked no more than is required for real consumption. The mines of Japan are rich in these metals, and the policy indicated looks extremely foolish.

To Explorers, Discoverers, Prospectors, and Miners,
on the Pacific Coast.

13.—BISMUTH.—Geognostic Situation.—Primary rocks, and particularly in quartz, gneiss and mica slate, generally associated with cobalt, arsenic, silver, iron pyrites and galena.

Extraction.—When found native and alone, the metal is fit for use immediately.* Most of the bismuth used in the arts is obtained in the process of making small from the ores of cobalt. At the bottom of the crucibles the bismuth, with other metals, is found. Apply a gentle heat, and the bismuth, melting first, can be poured off.

External Characters.—Color: silver-white, inclining to red. Occurs amorphous, plumose, reticulated and crystallized. Structure, lamellar. Luster, metallic. Softer than copper. Tarnishes. Melts at 476°. Specific gravity = 9.

14.—ARSENIC.—Arsenic is not used in the metallic state in the arts; and no mines are wrought for obtaining it. The forms in which it is employed are:

Oxyd of Arsenic. (White Arsenic).

Geognostic Situation.—This is a very rare mineral. It is found chiefly in the primary rocks, with the ores of cobalt, copper, lead, silver, etc.

Extraction.—The white arsenic of commerce is procured by the process of roasting the ores of cobalt, nickel and iron. These are placed in large cast-iron boxes, to which horizontal flues are closely luted. These are heated by flues from a furnace. When red hot, about fifteen pounds of the ore are thrown in, and when all the arsenic has been driven off another portion of ore is put in, and the process continued for twelve hours, during which time about 150 pounds of the ore have been used. What is collected in the flues of the boxes is broken off by hammers, freed from any foreign matter adhering to it, and purified by a second sublimation.

External Characters.—Color: white. Occurs earthy, capillary, and investing; also crystallized. Luster, vitreous. Fracture conchoidal. Brittle. Specific gravity = 3.7.

Chemical Characters.—At 380° it sublimes. Heated with charcoal, it gives a garlic odor. Soluble in ten parts of hot water. Poison.

Realgar.

Geognostic Situation.—Occurs most frequently in veins in the primary rocks, less often in secondary; also among volcanic matter.

It may be formed artificially by heating white arsenic (ratsbane) with half its weight of sulphur, until the mixture is brought into a state of perfect fusion.

External Characters.—Color, ruby-red. Occurs amorphous, disseminated, in flakes, in concretions, and crystallized. Luster, resinous. Streak, orange-yellow. Translucent. Soft; brittle. Becomes electric when rubbed on the sleeve. Specific gravity = 3.3 to 3.4.

Chemical Characters.—Melts easily and burns with a blue flame and white smoke, emitting the smell of garlic and sulphur.

Distinctive Characters.—The chromate of lead is much heavier, and tinges borax green. The red ores of silver and mercury are heavier and give a red streak.

Composition.—Arsenic 69; sulphur, 31.

Orpiment.

Geognostic Situation.—Secondary and primary rocks.

It may be prepared artificially by fusing together equal parts of white arsenic and sulphur.

External Characters.—Color, lemon-yellow. Occurs reniform, disseminated and in plates. Luster, shining. Flexible. Translucent. Sectile. Specific gravity = 3.4 to 3.6.

Chemical Characters.—Burns, emitting the smell of arsenic and sulphur. Becomes electric by friction.

Composition.—Arsenic 57; sulphur 43.

15.—ANTIMONY.—The ore from which the antimony of commerce is obtained is the

Sulphuret of Antimony.

Geognostic Situation.—Primary and secondary rocks chiefly in granite, gneiss and mica slate, associated with galena, blende, the ores of iron, copper and arsenic.

Extraction of the metal.—The ore is broken, freed from stony matter, and then put on the hearth of a reverberatory furnace, and covered with charcoal. The metal is then melted, while the foreign ingredients float on the surface, and are removed by ladles. The metal is poured into moulds and forms crude antimony. From this the pure metal is obtained by scorification. For this purpose, eight parts of it are finely powdered, and mixed with six of crude tartar and three of nitre, and the mixture then thrown in successive portions into a red hot pot. When the vessel is nearly filled, it is covered and a strong heat applied for half an hour; the melted mass is then poured into a conical iron vessel, greased in the inside, in which it separates into different layers, the upper consisting of scoria, the lower of antimony in its metallic state.

External Characters of the Ore.—Color: lead-gray. Streak, unchanged. Occurs massive, composed of delicate threads or needles, and crystallized. Luster, splendid. Fracture, fibrous. Yields to the knife; brittle. Specific gravity = 4 to 4.80.

Chemical Characters.—Melts in a candle-flame. Before the blowpipe emits the smell of sulphur and sublimes.

Composition.—Antimony 74; sulphur 26.

*Sometimes, however, it is necessary to mix it with half its weight of borax and of pounded glass, and subject to heat in a crucible lined with charcoal.

Anthracite. (Blind or Glance Coal.)

Geognostic Situation.—Occurs in imbedded masses, beds and veins, in primary and secondary rocks, often in graywacke, sandstone, trap-rocks, slate, etc. It is also called stoue-coal.

Black or Bituminous Coal.

Geognostic Situation.—Chiefly in the secondary series, sometimes in clay, sandstone and limestone. Its varieties are called slate, foliated, cannel and coarse coal.

Lignite. (Brown Coal.)

Geognostic Situation.—Chiefly occurs in secondary rocks; also in alluvium. Its other names are, bituminous wood, earthy coal, alum earth, jet and moor coal.

Rock Salt.

Geognostic Situation.—Secondary strata; often found associated with gypsum, clay, marl, &c.

Limestone.

Geognostic Situation.—Almost every rock below drift. The best marble occurs in the upper part of the primary, and lower part of the secondary rocks.

Gypsum.

Geognostic Situation.—New red sandstone, and other secondary rocks.

Clay.

Geognostic Situation.—Secondary rocks. Porcelain clay is found in connection with granite.

Plumbago.

Geognostic Situation.—In the coal formation; also in clay-slate. It is often called graphite or black-lead.

Precious stones.

Geognostic Situation.—Nearly all of them, as sapphire, emerald, spinel, chrysoberyl, chrysoprase, topaz, iolite, garnet, tourmaline, chalcodony, amethyst, &c, are always in the primary rocks. Quartz in the form of rock crystal, carnelian, cacholong, sardonyx, jasper, &c, is found often in secondary strata, especially in the trap rocks. The diamond is generally found in drift.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Considerable activity in mining sales during the last ten days up at Virginia City!

Potosi, \$200 per share.
Central, \$700 per share.
Ophir, \$11.00 per share.
Gould & Curry, \$300 per share.
Chollar, \$8 per share.
Lucerne, \$25 per foot.
St. Louis, \$6 per foot.
Mount Davidson, \$40 per share.
Mark Anthony, \$8 per foot.
Louise, \$16 per foot.
Bradley, \$8 per foot.
Sacramento, \$6.
Shelton Co., \$5 per foot.
Josephine, Flowery, \$8.
West Branch, Flowery, \$8.
Harrison, Flowery, \$12.
Yellow Jacket, \$40.
Exchange, East Comstock, \$25.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$18.
Hard-Up, \$5.
Chimney rock, \$12.
Dugan, \$10.
Rich Co., \$3.
Miller, \$6.
Costa Rica, \$5.
Spanish Co. Plymouth Ledge, \$8.
Chelsea, \$6.
King Charles, at Hovey, \$6.
Great Western Ledge, Gelena, \$10.

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.

[Having completed all the requisite arrangements, we shall in future be able to lay before our readers a reliable list of prices of mining stocks of Utah.]

DOWS' DISTILLERY,

SAN FRANCISCO.

THE PROPRIETOR OF THE ABOVE ESTABLISHMENT IS NOW MANUFACTURING about 300 gallons of WHISKY daily, and is prepared to furnish the trade with ALCOHOL, PURE SPIRITS and HIGH WINES, of a quality equal, if not superior, to any imported, as Wheat alone is used in their manufacture. Purchasers can be supplied with lots to suit at the depot, No. 214 Sacramento street. (mh8) E. T. FEASE, Proprietor.

RAVAGES OF GRASSHOPPERS.—We are informed, says the Placer Herald, of the 1st inst., that the farmers in the western portion of the county, on Coon Creek, and in Sutter, beyond Bear river, are experiencing serious inconvenience and loss from the grasshopper plague. These insects come from the west, and now cover a strip of country several miles in width. They have completely stripped several orchards and injured the trees greatly. Some of the farmers think they will attack the grain, which is yet soft. They cannot hurt barley, as the heads are now too hard. The operations of the grasshoppers are always confined to the open country of the plains, and never extend toward the foothills further than the edge of the timber.

A. KOHLER,

NO. 178 WASHINGTON STREET, SAN FRANCISCO.

Forty Cases of Musical Instruments Just Received,

Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS.

Also, TAMBORES, BANJOS, FIFES, FLUTES, CLARION PICALOES, VIOLIN BOWS, BOW-HAIR, ROSIN BRIDGES, PEGS, TAIL PIECES, FINGER BOARDS, TUNING FORKS, SSS ROMAN STRINGS (four lengths and four thread), and

ALL KINDS OF MUSICAL INSTRUMENTS,

Fresh every two months from Italy.

All of these goods will be sold to the trade, as they are direct importations from the manufacturers of Europe, and imported in large quantities by A. Kohler. He will sell them THIRTY PER CENT. CHEAPER than any other house in California; therefore it would be the interest of all to call and examine before purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by the case.

The wholesale department of this House is on Sansome street, occupying the whole block from Clay to Commercial street. mh8

Washoe Enterprise.

From the *Territorial Enterprise* we learn that a company of leading members of which are Peter Rice, formerly of Marysville, J. H. Atchison of the Spanish company, and Wm. Arlington, of the firm of Fall & Co., at Carson City, have bought a town and are making arrangements for a series of sites in the cañon between Washoe Lake and its terminus in Pleasant Valley. They intend to ditch and dam the lower portion of Washoe Lake, so that it can be controlled at all seasons of the year. In addition to this they are bringing from Alford's Cañon some 3,000 inches of water, which will be discharged at the head of the cañon. They have, by actual survey, that in a distance of three and a half miles, they can get a fall of 338 feet, and with the water from both sources obtain propelling power and space sufficient for the construction of a number of mills. The company is named the Washoe Mining and Manufacturing Company, and their enterprise will add materially to the wealth of the country.

AN OIL CAVE.—In Table Mountain, in the western part of Virginia City, Nevada Territory, says the *Washoe Times*, there is a cave some fifteen or twenty feet in diameter, of an irregular form, in the lava-like rocks composing the upper stratum of the hill, which contains, on its sides and floor a singularly substance, somewhat resembling hardened coal-tar. This substance appears to have exuded from the pores of the rocks forming the walls of the cave. If a company was to lease and secure the services of that long-legged, red-nosed, and vigilant guide to be the most perfect master of the art of mining to be found in the city, and set him at work near this cave, if the boring will fetch "oil," he'd tap the oleaginous reservoir in less than a week. In the cave there is no scarcity of those singular domestic fowls known to the juvenile community as "bustin big bats."

REGNANT FACTS AND FIGURES.—The total white population of all the slave States, except Delaware, is 7,564,600. The total white population of Pennsylvania, New York and Ohio, is 8,132,000. The three States last mentioned, can place a larger force in the field than all the slave States combined, should they join the Southern Confederacy. As the Southern Confederacy is now constituted, Pennsylvania, the second State in the Union, can furnish a more effective field force than it can; the white population of Pennsylvania being 2,906,000. At the last election Pennsylvania cast 476,680 votes, and the Southern Confederacy 959.

SOLAR PHENOMENON.—Three suns were seen at once at Martinsville, Va., one morning lately, and are thus described by eyewitness: In addition to the regular rising of "the glorious orb of day," two distinct suns accompanied the main body, one of which moved in a northern course, while the other bore along in a southerly direction—both equidistant from the main body. After the trio of suns had reached an altitude of the sun's height, the two gradually retired, when a beautiful rainbow arched the heavens, a sight too grand for words to describe or minds to contemplate.

WHY THE CANNON VENT IS CLOSED AFTER A DISCHARGE.—There are always left in a cannon, after a discharge, pieces of the cartridge bag on fire, and if the sponge is passed down the bore without closing the vent, a draft of air is created which fans the flame; but if the vent be closed, the smoke is pressed around the burning cloths and the fire is smothered. Sometimes when firing in the dark, a man cannot find the vent until the sponge is put in; then the flame will stream from the vent, as if the gun was quite full of fire.

WASHOE ANTS.—Among the other Washoe pets, says the *Times*, is an ant, which is a perfect beauty, and quite as comely as a scorpion or tarantula. It is about half as large as a honey bee; in color, it is black and sprinkled over with orange-colored hairs or bristles, and is armed with a most formidable sting, which it is nowise backward in using. Several large and most venomous centipedes have been found in this vicinity this spring. When you talk of venomous insects, Washoe can fill the bills.

BORING GLASS.—The London Magazine states that John Edgey, of that city, has succeeded in turning and boring glass, and has thus rendered it more applicable to a greater variety of useful purposes. He makes glass cylinders perfectly round and smooth; also very strong glass pipes as substitutes for metal in conveying acids and alkalies, and his instruments are eminently adapted for the barrels of pumps. Glass tubes of moderate bore are quite common, but they are never made with a uniform size of bore.

Zinc nails are now extensively employed in the manufacture of boots and shoes in place of wood or iron. It is said that the zinc nails are also substituted for sewing in ladies' slippers. An iron last is employed, and the nails, on being driven in, like the last, and become headed or riveted on the inside, thus forming a very secure fastening.

The newspaper is a law book for the indolent, a sermon for the thoughtless and a library for the poor—it may stimulate the most indifferent, it may instruct the most profound, and with truth it may be added—may become the merest spittle-crawler to a vile demagogue party, as well as the proud guardian of a nation's liberties.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our before extensive establishment, we can confidently announce to the public that we now have

The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp-shoes and dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flooring Mills; Gang, Sash, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at McLeod's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russian Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Smit Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe.
Bartola Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco.
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1881.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work. The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchasing.
- KNAPP, BURRILL & CO.,
ap19 310 (Old No. 80) Washington street, near Front, San Francisco.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munro & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a rejection, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as a gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

Rope Belts for Thrashing Machines.

THOMAS MAHER writes to the *Pacific Sentinel*, making use of the following facts, figures and argument in favor of rope instead of belting for machinery:

Every man who has a thrashing machine knows that the belt which runs from the jack to the cylinder on the separator, costs from fifty cents to one dollar a foot, and that the average length is from thirty to forty feet, costing from thirty to forty dollars. Here, I am fully convinced that a rope belt is equally as good as any kind of belting. I will mention one or two instances, and forcibly illustrate my views on this matter. The cost of the pulley is no greater than the ordinary one—only requiring a rim properly grooved. The rope needs no attention, except at times to be rubbed with grease, having a very small amount of rosin mixed with it. At first the rope will stretch very much and require to be taken up, but not in this case. The rope should be spliced by an experienced hand, as a bad splice will make it run bad.

The first experiment, I believe, has been made by the Greenwood Company of New Hartford, and is now working well. They say they transmit power, for a factory employing several circular saws, across a river 225 feet wide, by a five-eighths rope, running over two pulleys six feet in diameter, and making 360 revolutions a minute. The pulleys are sheltered, but the rope runs exposed in all kinds of weather without causing any trouble. The American Hoe Company, at West Winstead, Conn., say they are running a drop weight weighing 225 pounds with an inch rope—running from an 18 inch pulley making eighty revolutions to a 30-inch pulley—distance between the pulleys twenty-five feet. Previous to using the rope they had a five-inch belt, and were much troubled with its slipping. They use many others for various purposes, transmitting as high as six-horse power, and in some instances, exposed to all kinds of weather.

I give the above as samples of the extremes of motion within my own knowledge. I consider it valuable for many reasons. It is cheaper, costing about one tenth the price of belts, and can transmit power for any distance without shelter, except for the pulleys. Of course there are places, as with cross or very short belts, where it cannot be used; but for all belts of fair or extreme length, I certainly recommend it as cheaper and as economical of power as any belt in use.

CENTRAL RAILROAD.—It is understood, says the *Placer Herald*, that the affairs of this company are so entangled that there is no prospect of the road being opened for some time to come. The iron for that portion of the road not yet laid is still in San Francisco; the tressling over several ravines is yet to be constructed, and the ties to be brought on the ground. The actual work of construction has been idle for a long while. The people along the line of the road are weary and disappointed at the delay. When will the road be opened? With the work commenced and the money to pay for it, the road could be opened inside of ninety days.

A NEW CAR FOR MINERS' USE.—A new car for carrying ore down hill has been invented near Janimar city, in Sierra county, by Mr. Fraugh, superintendent of the Mammoth Quartz Mill. It has two small wheels, and the bed, shod with steel behind, drags upon the ground while going down hill, with a load of a ton and a half. As the hill is steep, this dragging is necessary to make the descent easy for the team. After the load is discharged, the bed is pushed forward so as to rest on the tongue, and not touch the ground, and then a pair of mules can haul it up hill again.

STRONG MEN.—A man with a lifting machine stopped at the Metropolitan Hotel, in San Andreas, lately. All the strong men in town tried themselves; the most lifted was eight hundred and seventy pounds. The proprietor of this contrivance says the strongest man in the State lives in Stockton; the best average lot he has yet found live at the town of Amador, in Amador county. Out of a small number of men, seven raised nine hundred pounds and one a thousand pounds. In Jackson, three men lifted over nine hundred pounds. At Mokelumne Hill they were all too lazy to lift.—*Independent*.

ANALYZING THE SUN!—Two German chemists, working together in their laboratory, at Heidelberg, have analyzed the body of the sun. Fabulous as it may seem, it is literally true. They arrived at the result of the analysis solely by close examination of the rays of light. By this means, it is ascertained, in a manner quite convincing to those who have witnessed the experiments, that the body of the sun contains large portions of iron and other metals and earth common to this globe of ours.

A LONG TUNNEL.—The great tunnel, 1500 feet long through the San Mateo mountains, in the Coast Range, has been completed. This enterprise belongs to the Spring Valley Water Company, and will convey water from the ocean side of the mountains to the bay side, for San Francisco use. Day and night, for nearly ten months, laborers were engaged in this great work.

THE YREKA JOURNAL.—This excellent paper, which needs but a little more local mining intelligence to be perfect, is about to be issued as a semi-weekly. Terms three dollars for six months.

A VENERABLE FREE MASON.—Hiram Imas, who is ninety-one years of age, and has been a Free Mason for sixty-eight years, recently marched on foot in a Masonic funeral procession, at Santa Cruz. He crossed the plains in 1849, and has resided in Santa Cruz ever since, where he is surrounded by his descendants of three generations. He retains his mental faculties to a remarkable degree.

UNITED STATES ARSENAL AT BENICIA.—This new building, says the *Napa Reporter*, was dedicated last week, on the occasion of its completion. It is a massive stone structure, 175 feet in length by 70 in width, built in the most substantial manner, and exhibiting finished workmanship in every part. It is three stories high, and has a square tower at the front, on the corner, and another at the opposite corner in the rear.

ARTESIAN FOUNTAIN.—An artesian well at Pacheco, Contra Costa county, throws a jet of water to the height of three feet from the ground.

A SPLENDID OPPORTUNITY.**AGRICULTURAL MACHINERY.**

As I have taken, for five years, a large portion of the state Prison Labor, for the sole purpose of manufacturing

AGRICULTURAL IMPLEMENTS AND CABINET WARE

I offer for sale, at a Great Sacrifice, in order to close out my present stock by September First, 1861, the following articles:

TWELVE-HORSE STEAM THREE-HEBS;
C. M. RUSSELL'S EIGHT AND TEN-HORSE THRESHING MACHINES.
J. A. PITT'S GENUINE MACHINES, FOUR, SIX, EIGHT, TEN AND
TWELVE-HORSE POWER, with all of C. M. Russell's Latest Improvements;

HAY PRESSES, REAPERS AND MOWERS;
EXTRA TRUCKS for Threshing Machines and WIRE TOOTH BUGGY HORSE RAKES.

All of the above goods will be sold at the Lowest Prices, either for Cash, or good approved paper at a low rate of interest.

FESTIVAL AND BALL.

GOLDEN GATE DIVISION, No. 12 S. of T.,

WILL CELEBRATE THEIR TENTH ANNIVERSARY BY A

FESTIVAL AND BALL

—AT—

PLATT'S NEW MUSIC HALL,

On Tuesday Evening..... June 18th

Tickets One Dollar

[ADMITTING LADIES].

All friends of Temperance, irrespective of party or party organization are earnestly requested to be present.
Festivities will commence at 8 o'clock precisely.

PROGRAMME.

1—Meeting called to order by the Chair; 2—Song by Members of "The Twelve;" 3—Comment and Speech by Hon. George Barstow on "Washington's Farewell Address," sustained on each side by the different officers of Good Templars, dressed in Regalia; 4—Appropriate song by members of "The Twelve;" 5—Pertinent and brief Address by the Rev. T. Starr King; 6—Drinks Address to the American Flag, by Mrs. Estelle McDonald, dressed in the regalia of the Good Templars; 7—A spirited and brief Address, by the Rev. George B. Taylor; 8—Song by the Members of "The Twelve;" 9—Our Native Country, These; 9—Recapitulation of the Order of S. of T. by a member; 10—Grand Promenade March, which will form into First Quadrille, under the supervision of Messrs. J. Coghill and D. Fitzgibbons, Floor Managers.

Order of Dances.

1—Quadrille; 2—Waltz and Polka; 3—Grand Portland Fancy; 4—Spanish Dance.

INTERMISSION AND COLLATION.

5—Schottische; 6—Mazourka; 7—Quadrille Laancers; 8—Cecilian Circle; 9—Tempest; 10—Varsouvienne and Polka; 11—Dan Tucker's Reel; 12—Waltz Quadrille; 13—Waltz; 14—Virginia Reel; 15—Quadrille Cheat; 16—Medley.

MUSIC BY THE BAND—"YANKEE DOODLE," "HOME."

RECEPTION COMMITTEE.—JOSEPH WEED, JOHN WADE, J. J. HUCKS, J. I. PIERSON, I. M. BLOOM, S. C. LEBANARD, M. E. HOWARD, O. P. TRESEDELL, H. M. COX, W. PEAKE, Z. SNYDER, A. WHITTON.

Sons of Temperance will wear Rosettes of Red, White and Blue.
Good Templars, Rosettes of Red and Blue.
Lady Dashaways, White Rosettes.
Cadets of Temperance, Red Rosettes.

All Committees will be on hand at the hour and serve punctually.
Rosettes and Regalia will be obtained of the Committee and Marshals of Good Templars at the door.

Ladies belonging to the different Orders will take their positions on and near the Rostrom.

HENRY LAW, SUMNER C. BLAKE,
DR. W. H. IRWIN. (jc6) Com. of Arrangements.

"WILLOWS."

To comply with the general demand of the public and at the special request of the Lady Managers,

THE FAIR

Will be continued during the rest of the week, with the following Programme:

Wednesday, June 5th.

Continuation of the Sale of Goods by the Lady Managers.

Thursday, June 6th.

Great Auction Sale by the Ladies and their assistants of all the Bountiful Fruits and different Goods on Exhibition.

Friday, June 7th.

GENERAL LIQUIDATION.

Saturday, June 8th.

At 12 o'clock M., precisely,

DRAWING OF THE TOMBOLA.

Nothing will be neglected by the Managers to deserve the kind patronage of the public.

OPPOSITION TO THE MONOPOLY

—OF THE—

CHARTRES COFFEE.

D. Ghirardelli, who has had for ten years the only

STEAM MACHINE for the manufacture of

Chocolate and Coffee!

Announces to the public that he has received by the ship Imperial the best quality of Coffee, called

FAMBURNER,

And that, with the exception of a small quantity in the hands of Messrs. Moore & Folger, he is the only possessor of this fine article.

D. GHIRARDELLI is sure to furnish to the market the best and finest quality of Coffee, which will increase the renown of the well known

D. GHIRARDELLI'S COFFEE!

Besides having arrived by the steamship Golden Age, a French workman well acquainted in this business and expressly requested, who will beg the preparation of the

CHARTRES COFFEE!

Prepared in the same way as used in the town of Chartres, which has succeeded in gaining a well-deserved name for its superior Coffee.

Attention!—THE CHARTRES COFFEE WILL ALWAYS BE SOLD FIVE CENTS PER POUND CHEAPER THAN THE D. GHIRARDELLI'S COFFEE.

SAN FRANCISCO, SATURDAY, JUNE 15, 1861.

NO 12.

NEW SAFETY VALVE.—McCurdy's Steam Automatic Safety Valve has been tried in this city, and is a triumphant success. It will undoubtedly be adopted at once throughout the Union; and the patentee reap a golden reward for his instructive genius.

Hutchinson's Magazine.—The June number of this monthly is remarkably attractive. It is by far the best that has been issued for many years, and if the proprietors continue their magazine in such style it will soon rank where it ought to, with the best magazines on the Continent.

SUBURBAN RESORTS.

The Willows.

Of all places of public resort in the suburbs of San Francisco, none has achieved such remarkable popularity in so short a period as has the Willows, under the management of its new proprietor, F. L. A. Pioche, Esq., whose aim seems to be, not so much to add to his already well filled coffers, as to provide cheap and delightful recreation for all classes of our metropolitan community, on the European plan. The Willows—so accurately represented by our artist and engraver in the accompanying beautiful illustration—can be reached by railroad, buggy or omnibus, as the pleasure-seeker may elect; and being only a short distance from the Mission Dolores, little time is expended in traversing the intermediate space between it and the city. The elegant and commodious cars of the Market St. Railroad run on gala days every five minutes to and from the Willows, conveying visitors the entire distance (some four miles) in about ten minutes, and at the trifling expense of ten cents each way. On these days (Thursdays and Sundays) free concerts are given, when the most admirable selections from the best masters are played by an orchestra of twenty performers, whose peers cannot be found on the Pacific Coast. They perform in an elegant orchestral palace, from the front of which a semi-circular platform projects, upon which the beautiful forms of our most admired cantatrices are sometimes seen, while their exquisite vocalism is heard like warblings of tropical birds among the whispering trees. Hundreds of chairs and benches are ranged in front for the convenience of the vast audiences that greet with critical applause the enehanting performances. Every imaginable species of diversionment can also be indulged in by visitors, from rifle-shooting down to the barrel game—but these we shall more particularly allude to in a succeeding number. Should they feel desirous of quiet, they need only ramble along the

shady avenues and walks, beneath the thick luxuriance of beautiful willow trees, to find arbors and nooks, whose cool recesses—furnished with chairs and tables, where the poet may unloose his lyre, the lover proclaim the ardor of his honorable passion, or the *bon vivant* indulge in champagne lunches—provide all the delightful seclusion that could be wished; and this, too, in spite of the vast multitudes attracted to this second Arcadia every gala day! Reasonable popular employment reaches its acme at the Willows, and the public cannot be too grateful to the Prineely Pioche for his unexampled generosity in providing it free to all.

[To be continued in our next.]

HOW TO KILL THE BORER.—The Farmer informs us that the only remedy for the borer, yet known, is the placing leached ashes, or tobacco leaves, around the tree, to destroy the eggs; or, root out the insects, at its earliest stages, with a sharp pointed piece of whalebone, or a piece of wire. Some have used brine around the tree; this is dangerous, however, unless applied just before a rain; but this is only done in the early spring to destroy the eggs; when once the borer is at work follow him with the wire, else he will destroy the tree by girdling underneath the bark, and eating the *albhernum*. When a tree has been badly eaten or girdled, it can be saved by cutting away the eaten wood, and the application of stripes of new bark from any fresh limb, and thus graft them on, binding and covering them with cloth and a wash of clay, to keep out sun and air.

Tobacco Culture.—Some of the farmers of San Joaquin county have commenced the culture of tobacco. Two of them have several thousand plants of the Havana, Virginia and Connecticut varieties, and they intend to test thoroughly the practicability of cultivating the plant in that locality, the coming season. The efforts at tobacco raising in the vicinity of Marysville have been attended with success.

To Washoe.—The Big Tree route to Washoe is now opened for the passage of teams.

THE COMING FOURTH.—Extensive preparations for the celebration of the glorious Fourth of July—treble dear to us in these rebellious times—are being made in this city, and in fact throughout the whole State.

LARGE CALF.—Silas Stone, a well-known resident of Contra Costa Co., residing near Alamo, informs the Contra Costa Gazette that he weigh'd a new-born calf, from a Durham cow belonging to him, a few days since, and found its weight to be 115 pounds. Can any stock-owner in the county beat this?

A USEFUL MISSION.—Col. A. Harasthy, left on the last steamer for Europe, as Commissioner from this State to the Wine producing countries. Prior to his departure he addressed a parting letter to the people of Sonoma county, where he has so long resided, in which the following passage occurs:

"Gentlemen, I am going, on the 11th of this month to foreign countries, to herald the innumerable advantages, prosperity and wealth of California, and in particular of Sonoma county, to the opulent European banker, merchant, wine and brandy manufacturer, and to the honest, poor laborer. I will prove to the former that, by a prudent investment of their capital, a rich harvest will be their reward, and to the latter, a happy home, independence, and a sure prosperity must follow their labor in this our prosperous and, by nature, favored country.

"Furthermore, as a bee collects her honey, I will gather for my State, for you, and for myself, the choicest, the rarest, and the most profitable fruits and grape vines scattered over the vast fields of Europe and Egypt; but while gathering nature's gifts, I will not neglect collecting and compiling the experience of nations—to use that present of Providence to the best advantage, which the practical aid and gradual increase of science has taught them to use for the comfort, wealth, and prosperity of their people. I will carefully note down the practical experience and views of the vine grower, the pomologist, and the wine maker. I will search into and report to you the views, knowledge, and methods of the lands, men, etc. In short, you shall have all they have, and know all they know.

Yolo Crops.—The News estimates the product in that county this year, of wheat, at 25 bushels per acre against 35 bushels last year; and of barley, at 30 bushels against 60 bushels last year. It admits, however, that the yield will be a fair average, though the deficiency of the wheat crop as compared with last year will be nearly 140,000 bushels. The product of last year was about 470,000 bushels.

Interesting Correspondence from Nevada Territory.

A correspondent of the Napa Reporter writes from Carson City, as follows:—"I believe in the old adage, that 'a rolling stone gathers no moss,' and advise every one who is getting along well, and making something, to stay at home, and not let the bird in hand go for those in the bush. Californians are too apt to run without cause, or without definite object in view, just because distance lends enchantment to the view." Still, I am very far from dissuading people from coming over here, for without doubt, there is money to be made here, and this is a Territory full of promise. But this is a new place, where everything must be created, and where it will therefore take time to make a fortune. Still, for a man of energy, perseverance and patient courage, this is the best opening that I know of. Money is still very scarce here, notwithstanding which, substantial improvements are being made rapidly. Virginia is now incorporated, possesses water-works, is grading its streets rapidly, and is being adorned daily by new brick and stone buildings. Silver City Gold Hill and Carson City are also improving very fast. Foundations for some twenty miles are being laid along the Carson river. Fuel is getting scarce around Silver City, Gold Hill and Virginia, and water powers are worth to-day thousands of dollars. Notwithstanding the large number of mills now in operation and building, profitable employment could be had for three times that number, as plenty of claims have to lay idle for want of mills to do their work. Claims, generally speaking, are improving constantly, and large numbers, supposed to be worthless, are turning out rich, on being prospected. In Flowery District, two claims have been opened, prospecting richly in gold and silver. Gold Hill improves as they go down, and at this moment is paying richer than ever. Around Silver City the mills keep busy day and night; while further down, the Daney Lead is turning out fabulously rich. I was in their drift yesterday, and found the gold visible to the naked eye, the whole width of the tunnel. From Esmeralda, the reports are favorable from the leads; they are working on, but there has been very few worked thus far, in consequence of the low passed last Fall, exempting claims from being worked, till the 1st of June. On that day, there will be a general scramble for the jumpable claims, and the merits of the District will be made apparent. From the Humboldt, we have very encouraging news. The boys got their tunnel through on the Cuba Ledge, and struck it very rich in gold; the quartz looks California like—full of free gold. The news getting in here, caused a perfect stampede out there from Silver City, Gold Hill and Virginia. I mentioned in my last, the discovery three miles from here, of surface gold diggings. Since then, the companies have begun work, and are making from \$16 to \$20 per day to the band, of gold worth \$17 50 per ounce; thus you see that little by little this Territory is showing itself. Our jolly Governor is taking it easy about coming out, and we are now without any laws or government; still, everything is going on quietly and well, the lawyers only complaining of slack business. We have now a daily stage from here to California, a tri-weekly to Esmeralda, a daily to Virginia, also a daily to Chinatown and a weekly to the Humboldt,—intely started. The roads into the Territory are in splendid order, and freight down to five cents,—bringing things down almost to California prices."

Another correspondent writes even more enthusiastically thus: Men often say they would have more confidence in the country if they could see the gold and silver. If these skeptics were here a few days, they might have the evidence so much needed to remove their doubts. I met with an old friend here who is foreman of one of the largest mills in the country. He informed me that his clean up last week for one company, amounted to seven thousand five hundred and thirty ounces of gold; which, being mixed with silver is worth from six to twelve dollars per ounce. Even at seven dollars per ounce this would amount to fifty-two thousand seven hundred and ten dollars. This I saw with my own eyes; it was in a large safe, there being four or five wooden buckets and as many square boxes, about 8 by 12 inches, filled with the precious metal.

I was informed by another gentleman, who is perfectly reliable, that the receipts of one company in Gold-Hill, for the last two hundred days, had been one thousand dollars per day. Five thousand dollars per foot would not purchase this ground. There are hundreds of claims, which, when opened, will be equally or very nearly as rich—some richer, yet men at home think it is all a humbug. I tell you all this country wants is time and capital, to prove it the richest country in the world. True, it is not as good for poor men as placer diggings; for there they get their pay as they go,—here they have to wait until their claims are opened; but, though attended with some expense for a time, when it does commence paying it pays largely.

I have been fortunate enough to secure twenty feet on what is proved to be an extension of the original Comstock & Gold Hill ledge. Should this prove as valuable as many claims which have been opened on the same ledge, (and there is no reason why it should not), I will be well paid for my trip over the mountains. In the last few days there has been a great rush to the Humboldt. From specimens brought in since my arrival, there has been some of the richest gold quartz discovered there, that has ever been found in North America. My company were off among the foremost of the crowd, and I feel very confident that we will secure something valuable.

Tepic, Hermosillo and Guaymas.

A correspondent of the *Alta*, writing from Mazatlan, gives the following interesting facts:—"Tepic, once such a handsome city, and boasting of its fine healthy situation, and its great trade with the cities of Guanajuato and Guadalajara, is now nearly ruined. The civil war waged between the opposing factions in Mexico, for the past three years, has almost destroyed it, and even at our present time of writing, the ferocious and brutal robber, Chieftain Losenda, with his band of Indians from the mountain fastnesses of Alica, is again threatening the remaining inhabitants. A few days ago, on the 6th inst., Losenda and his band, numbering about one thousand of these worse than tigers, assaulted the village of San Pedro, about forty miles east of Tepic, and containing about three thousand inhabitants, and in a few hours pillaged and burned the place, killing, in cold blood, upwards of 400 persons, men, women and children.

"Guaymas is the only port of entry for the State of Sonora, all foreign goods consumed by its inhabitants, besides a large amount sold annually to the State of Chihuahua and the U. S. Territory of Arizona go through its Custom House, and are from thence transported by wagons or on the backs of mules, hundreds of miles into the interior to the different towns and trading posts. Hermosillo, the principal town and the actual capital of Sonora, is distant from Guaymas about one hundred miles, a day's travel in the stage. It has a population of from 12,000 to 13,000, and is said to be beautifully situated and very neatly built.

"The population of Guaymas is now about 3,000 souls; although less than two years ago, previous to the commencement of the Yaqui Indian war, it contained about 5,000. In a very short time, peace being restored, it will again reach that number, and with the impulse now given to the place, by the advantages of the transit route through Sonora to Arizona, and the speedy communication which the steamship line gives with San Francisco, not many months will elapse ere Guaymas will be a town of 10,000 inhabitants. It has many natural advantages for a great commercial point, and the daily discoveries now being made of rich silver mines in Sonora and Chihuahua, must attract a great number of people hither, and upon the further developments and future workings of these mines, such an impetus will be given to Guaymas, that it will soon rank as the second of the Mexican Pacific ports.

The State Boundary Commission.

Col. Forman, the Commissioner on the part of the State of California, who is operating in connection with the United States Commissioner in running the eastern boundary of the State, arrived in Stockton on the 2d inst., says the *Republican*, accompanied by Lieut. Williamson, astronomer of the State Commission. Messrs. Forman and Williamson left San Francisco on the 18th April, for San Pedro, the port of Los Angeles, to visit the initial point on the Colorado river. After a few days of preparation at Los Angeles, the party left on the 25th, and reached Fort Morgan in fifteen days, where five days were spent in duties connected with the commission. On the return journey the party left the Mojave river at the "Point of Rocks," some fourteen miles above where the Los Angeles road leaves the river, and traveled in nearly a direct line a little north of west, to the Tubee-chay-pah Valley, distant about seventy-five miles. This is the first time a wagon has passed over this route, and it is an entirely new one. By it C. L. Forman and Lieut. Williamson reached Visalia from the "Point of Rocks," in one day more than would have been required to have gone from the Point to Los Angeles. It would have been an immense saving of time and distance for any party from the Colorado river or Potosi mines, to the Tulare, San Joaquin and Sacramento valleys, to take this route. The beds of some dry lakes (laid down on the map of California as one lake) were traversed; the bottoms were as hard as granite and as smooth as a pavement. On digging for water on the margin of one of them, it was found of excellent quality at the depth of four feet. When Col. Forman's report is published, it will doubtless contain much valuable information of that section of country, now but little known. Col. Forman and Lieut. Williamson are on their way to San Francisco, where preparations will be made for the immediate transfer of the astronomical parties of the joint commission to the vicinity of Lake Bigler, where a second astronomical point will be established. Lieut. lves, the astronomer of the United States Commissioner, is now in San Francisco.

SALIVATION ABOUT THE QUICKSILVER MINES.—A correspondent of the *San Jose Mercury* writes thus about the New Almaden mine:—"Although great care is taken to prevent the escape and waste of quicksilver while in a state of vapor, yet much loss is experienced in this way. The air for some distance around the furnaces is impregnated with it; and the men employed around the retorts frequently become salivated and poisoned from inhaling it. Cattle that feed upon the wild oats growing luxuriantly upon the adjacent hills, loose their teeth, and eventually die from its poisonous effect.

NATURAL PHENOMENON.—On Sunday last, an unusual phenomenon was observed in the heavens which attracted much attention. It was a large and distinct circle around the sun, containing all the colors of the rainbow. At times, a portion of another circle, much larger, but quite indistinct, could be seen.—*San Joaquin Republican*.

HEYNE MANN, PICK & CO.

311 and 313 California street,
WAREHOUSE OF THE SAN FRANCISCO

PIONEER WOOLEN FACTORY,

Have Constantly on Hand

A FULL ASSORTMENT OF WHITE, BLUE, GREEN AND SCARLET,
2½, 3 and 4 point Blankets.

—ALSO—

Superior All-Wool Family Blankets.

—ALSO—

Shuico Blankets, especially adapted for Quartz Mining. This article has met with general approbation, and Quartz Mills in general will do well to give it a trial.

Having made great improvements in the works of the Factory, including new steam engines, etc., special attention will be paid to the execution of all orders.

Steamers and Hotels can be supplied with Blankets at the shortest notice. Buyers will please examine the California make, the superiority of which over imported Blankets is generally admitted.

All business connected with the Factory is transacted exclusively at their office—no other party being connected with it. ap19

HUNT'S

IMPROVED FIRST PREMIUM
WINDMILLS:

AN ASSORTMENT KEPT CONSTANTLY ON HAND AT THE MANUFACTORY,

Nos. 30 Second street, 208 & 201 Jessie street,
SAN FRANCISCO.

THIS WINDMILL WAS AWARDED THE FIRST PREMIUM AT THE MECHANICS' FAIR OF 1860, in San Francisco, for its great simplicity, strength and durability. It is easily controlled, and will be sold cheaper than any other Mill built. Further particulars in circulars.

The following committee awards the above premium: Devoe, Garratt & Ware; all of this city.

PRICES.—Eight feet wheel, \$50; Ten feet wheel, \$75; Twelve feet wheel \$100 to \$125 ap19 E. O. HUNT, Builder.

UNDERTAKING.—The undersigned would most respectfully inform their friends and the public that they have opened their

COFFIN WAREHOUSES

at 161 Sacramento street, below Kearny, and are ready at all times, night or day, to attend to every call in their line of business. Their stock is very complete, and will enable them to furnish every description of funeral, plain or costly, at the shortest notice.

All persons wishing to make interments in Lone Mountain Cemetery, can do so by applying to us at 161 Sacramento street. nov3

MASSEY & YUNG.

METALLURGICAL WORKS

For the Extraction of Gold from Sulphurets and Quartz Tailings.—A Mining Engineer, thoroughly acquainted with this business, practically and theoretically, offers his services to a responsible party with the necessary CASH, for the construction and superintendence of works of this nature. Further particulars at the office of the PRESS. ap19

VULCAN IRON WORKS CO.

P. TORQUET, MANAGER.

STEAM ENGINE BUILDERS, BOILER MAKERS, IRON FOUNDERS AND General Engineers. First street, near the Gas Works, San Francisco. Steamboat Machinery built and repaired; also, Saw, Flour and Quartz Mills, Pumping and Mining Machinery, etc. The Vulcan Iron Works Co. invite the attention of Quartz Miners and others interested to their new style of Portable Dry Crushing Batteries with wrought-iron framing. feb15

FIRE INSURANCE.

The undersigned offer insurance in the following well-known first-class companies, on the most favorable terms:

Hartford Fire Insurance Company, Hartford.

Phoenix Insurance Company, do.,

Merchants' Insurance Company, do.,

City Fire Insurance Company, do.,

Charter Oak Insurance Company, do.

MCLEAN & FOWLER, Agents.

Office—Northeast Corner of Clay and Battery Streets. ap4

TO INVENTORS AND DISCOVERERS, MECHANICS AND MACHINISTS:

The undersigned, having had great Experience and Facilities for completing and carrying out Inventions and Improvements upon all kinds of Machinery and Implements, also preparing the requisite Drawings, Models, Drafts and Specifications, and is otherwise conversant with all principles in Mechanics of modern practice, and could prove, therefore, of invaluable aid to Inventors and Discoverers. Those contemplating bringing their inventions in a proper shape before the U. S. Patent Commission are particularly requested to consult the subscriber.

ASSAYING. *

Importance of Fair Samples in Assaying.

In making assays of auriferous minerals, as, indeed of all ores, the first point is, to get a fair sample of the mineral; and whenever the result of an assay is to be considered as the basis for the purchase of the claim, or the investment of money, the person proposing to purchase or invest should first satisfy himself that the sample assayed was a fair average specimen. He should know that the sample was chosen with all the honesty and precaution of which such cases admit. Metalliferous vein stones vary greatly in richness; in some places presenting nearly pure metal, in others, being almost barren. It is a very common occurrence in mining countries, that dishonest men select rich bits of ore, have them assayed, show the assayers' certificates, assert that the samples assayed were fair samples of the vein, and try to find purchasers on the credit of their assertions. The proper way to guard against such frauds is, to know that the assay fairly represents a considerable quantity of mineral, which, itself, fairly represents the body of the claim as near as possible. Only very small amounts can be assayed; but it is an easy matter to ascertain, by assay, the value of a large quantity of rock. A ton of rock may be pulverized finely, then mixed up together carefully, and the powder will be of the same quality throughout; and then an assay of an ounce of it will truly represent the whole ton; whereas, if an assay had been made of an equal weight of rock broken off at random from the vein, the result would not have given any trustworthy indication of the worth of the rock. In case that dust is to be assayed, it should be melted and stirred together, and then chips chiseled off from opposite corners may be assayed. It has frequently happened, for instance, that gold miners in California have brought their dust to San Francisco and deposited part of it in the Mint, and part of it in a private refinery, and found that the deposit in one place was estimated at a higher value per ounce than in the other; and this with dust, all of which had come from the same claim; and then they have made charges, or had suspicions of dishonesty. But this was a mere suspicion, without good cause, unless the discrepancy was larger than any I have ever heard of. In such case, if the miner had wished to test the accuracy of the assays, he should have made sure that the samples to be assayed were of precisely the same quality, and that can only be done by melting together, if the substance be metal, or mixing together in powder, if it be an ore.

MODES OF PLACER MINING.

List of Modes.

The modes of placer mining are numerous, and most of them are named after the instruments used. The principal are knife mining, dry digging, dry washing, panning, mining with the cradle, with the quicksilver machine, the tom, the sluice—of which last there are several kinds—and the hydraulic process.

Knife Mining.

Mining with the knife is the simplest mode of obtaining gold. It can be pursued with profit as a business, only by experienced miners, in diggings rich in coarse gold. The knife miner must know where to look for the richest spots, and avoid everything else. He seeks for crevices, from which he scrapes all the dirt, picking out the separate pieces of gold, if it be coarse, or if it be fine, putting gold and dirt together into his pan, and panning out when his pan is full, or when he has done with a crevice.

Dry Digging.

Dry digging differs from knife mining in this, that the latter requires the use of the knife and pan, whereas the former may require the use of the pick and shovel to strip off the top dirt, and does not require the pan. Dry digging is a mode of mining, and is not to be confounded with "dry diggings," a kind of mining ground. The process of dry digging has been described in a former article.

Dry Washing.

Dry washing is used in very rich coarse gold diggings, where there is no water. The miner tosses the dirt into the air while the wind is blowing, and thus gradually winnows out the gold. The Mexicans have done more work at this kind of mining, in California, than any other class. The *Mariposa Gazette* thus describes the process as pursued by them in that county:

"During the dry summer months, the Mexican miner may be seen, at almost any hour during the day, coyoting (burrowing like the coyote, or small California wolf) for gold in the neighboring hills or the adjacent flats. Sinking a square hole, some four or five feet deep, to the bed-rock, he carefully scrapes all the dirt lying immediately on the ledge into a wooden *batea*, (or pan) which he carries to the nearest tree, and under its shade ponds up the hard lumps of earth, until nothing but dust remains. A hallock's hide is now spread out upon a level spot, when the Mexican raises the *batea* above his head, and with an oscillating motion shakes out the dust upon the skin, until all the dust has fallen. This process is repeated for a number of times, until very little of the original mass remain, which is carefully collected and placed in a pile separate from the unpounded earth. When it is found that the claim from which the dirt has been taken pays rich, or even reasonably well, the Mexican returns to his diggings, and commences to cut into the sides of his hole, just above or adjacent to the bed rock. They are a species of hadger miner. Sticking close to the ledge, they will har-

row with their light crow-bars for a distance of six or eight feet, ascending or descending with the ledge, following it closely, and carefully scraping up the earth upon its surface. They seldom use any other tools except the small crow-bar, which is pointed at both ends, the *batea* and the boro spoon, with which they scrape and rake up the soil, after first loosening it with the bar. They are by no means selfish in their mining operations. When one strikes a good claim, his neighbors and friends are soon informed of it; but it is only to their own countrymen to whom he is thus disinterestedly generous. When one claim has proved good, the whole of the galeh, flat or hill, is soon taken up by his compatriots, and then begins the work of coyoting, in which they seem to delight, and which gives so remarkable an appearance to the mines wherever they have been working. Dry washing requires considerable slight of hand in working to advantage. A windy day is preferable for this manner of washing, as the wind more rapidly carries off the fine dirt, while the great density of the gold removes all fear of its being carried off the hide, even by the strongest breeze. The Mexicans make a good living during the summer months at dry washing, and in many instances we have known them to realize small fortunes by this manner of washing."

Panning.

[The process of panning has been described in a former number.]

It sometimes happens, in mining with the pan, but much more frequently in mining with the rocker, that a large quantity of black sand, full of fine particles of gold, is collected. The black sand is very heavy, and cannot be separated from the fine gold by panning; and blowing must be resorted to. This is done in a "blower" of tin or brass, a dish from four to ten inches wide, and twice as long as broad, open at one end, with a rim an inch high, at the other, and the two sides into this blower the black sand and gold are poured; and while the mouth of the blower is raised a little above the level, the miner blows the sand away, gently, with his breath, occasionally shaking the blower, so as to change the position of the particles.

How the Crops Look.—The prospect for a bounteous in this country, says the *Shasta Herald*, the present season, is not quite as promising as usual. As a general thing the crops are light, and in many instances they will prove a failure. The want of rain in the month of April was seriously felt, and operated disastrously in some sections. There will, however, be a fair yield, even now, and indeed it might prove quite as lucrative to the producer, for while the yield will probably be less, it will be less expensive to harvest it, as the straw will be light, and the price will be more remunerative.

The *Shasta Cruz Sentinel* says: We are informed by a gentleman well posted, that the grain crop of Santa Clara county is a complete failure—that there will not be as much grain reaped this season as was put in the ground. Farmers there are now cutting almost everything for hay. In Contra Costa, one of the best grain growing districts in the State, the growing crops are suffering for want of rains, and even now it is supposed not half of the usual crop will be realized. In Santa Cruz the crops have suffered but slightly, so far as we have heard.

THE PRE-ADAMITE EARTH.—The discoveries of modern geology show conclusively that the luxuriance of the animal and vegetable kingdoms was most surprising during the long ages preceding the advent of man. The trees in those vast forests, of which our coal-beds are the remains, could not have been less than three or four hundred feet in height and proportionally large, and they must have grown with far greater rapidity than any vegetation of our own times. It is believed that there were fishes in the sea hundreds of feet in length and ten times longer than the largest whales; and that there were land animals of such gigantic proportions that an elephant would seem but a mere insect in comparison with them. All researches among the fossils of extinct species demonstrate that the animals of the ancient world were of the most tremendous description, balking monsters in the luxurious wilderness of vegetation; and the fabled dragons of antiquity were in reality outdone by the colossal beasts and reptiles of the pre-Adamite world.

IMPROVING.—The number of houses in Grass Valley is increasing daily, and we are glad to see that the people there are putting up nothing but substantial, fire-proof buildings. A wooden town, in this dry climate, cannot be considered a town, being liable, at any hour, to be swept out of existence. Our people have learned this to their cost, and the people of Grass Valley seem also to have profited by their experience. A Delano ("Old Block") has commenced the erection of a fire-proof bank on his lot, adjoining the Exchange. Preparations for more are going on, and the foundations of three new fire proofs will be laid next week. Real estate in Grass Valley is not only holding its own, but increasing in value, and this is the surest index of the prosperity of a city.—*Nevada City Transcript*.

The longest railway drawbridge in the world was recently completed over the Illinois river, on the line of the Loganport, Peoria and Burlington railway, at Peoria, Illinois. The draw is two hundred long. The masonry, 2,350 cubic yards, was completed in nine weeks. Just above the bridge is a carriage bridge with a draw of two hundred and ninety-three feet.

CALIFORNIA WINE.

CARD.

LAKE VINEYARD, Los Angeles county, Cal.,
March 21, 1861.

BEING OFTEN APPLIED TO BY ACQUAINTANCES THROUGHOUT THE State for my Wine in small quantities, I hereby notify them, as well as the public generally, THAT I HAVE APPOINTED

Messrs. Hobbs, Gilmore & Co., of San Francisco,
MY SOLE AND EXCLUSIVE AGENTS

For the State of California, for the sale of all the different classes of Wine manufactured by me at Lake Vineyard (and that they cannot be obtained of any other parties) giving the assurance that they will obtain from them the same article in every respect as I have in my cellars B. D. WILSON.

NOTICE.

In conformity with the above card, the public are informed that we, the subscribers, have for sale, at our

WINE CELLARS,

Southeast corner Market and Beale Streets,

Nearly opposite the Railroad Depot,

PURE WINES,

CONSISTING OF

Port, Angelica and White Wine

All warranted to be the pure juice of the grape,

Which we will sell in quantities to suit purchasers, put up in shipping packages, or otherwise. HOBBS, GILMORE & CO.,
my23 Market street, opposite the Railroad Depot.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved

AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz.

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee, J. B. BEERS

Mal5

165 Clay street,

WE ARE NOW PREPARED TO RECEIVE GUESTS

—AT OUR—

NEW SALOON,

327 Montgomery street, TUCKER'S BUILDING,

—FOR—

BREAKFAST, LUNCH, AND SUPPERS.

Where will also be kept on hand every variety of CONFECTIONERY, JELLIES, ICES, PASTRY, CAKES and BREAD. Our Manufacture is on the premises, where we make every article sold from our counter. We are prepared to furnish Balls, Weddings, Reception Parties, or Families, with every article desired, in small or large quantities. All will find it to their advantage to examine our goods, as they will find them manufactured from the very best material, and with utmost care, and sold at reasonable prices. The Manufacturing Department is under my own immediate supervision, and having had over twenty years experience in our business, we feel much confidence that we shall please the public. All goods sent free of charge.

my24

JNO. J. HALEY.

TEETH! TEETH! Extracting without Pain! Dr. W. H. IRWIN, Dentist, Third street, near Howard (opposite Estill's Mansion)

All branches of Dentistry performed in the neatest manner.

Extracting, each, \$1.

Extracting children's teeth, 50 cents.

Filling with gold, each, \$1, \$2 and \$3.

Filling with platinum cement, \$1, \$2 and \$3.

Cleaning, whitening and burnishing, \$2, \$3 and \$5.

Straightening, etc., from \$2 to \$5.

Nerves killed and Toothache cured, \$1.

Whole or partial sets nicely and firmly adjusted on the finest gold, at from (each tooth) \$5 to \$10.

On the best silver plate (each tooth) \$3 to \$6.

Montgomery street Omnibuses pass the office every five minutes. Special attention paid to Children's Teeth. Circulars, giving full directions to patients for the preservation of Children's Teeth. Remember the place—Third street, near Howard.

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

THE COOLIE QUESTION.

For many years the miners of California have been much exorcised, on account of the multitudes of Chinese who have migrated hither and pitched their tents in our gold regions, to the exclusion, in very many instances, of white men. When rich placer and river diggings were plentiful, the influx of these Asiatic hordes attracted little attention; but when they became scarcer, loud complaints were heard from all quarters; petitions were sent to successive Legislatures, and laws framed, by whose enactment it was hoped and believed that the Chinese would be driven from the mines. The proverbial cunning of the mongols has, however, in a great measure, rendered such laws inoperative, and the white miners have, in most of the districts, found it necessary to form leagues to protect themselves from these barbarous pagan interlopers. Resolutions have been passed, summarily ordering them to leave the various localities, and all the terrors of lynch law have been invoked; yet still it appears they infest the mines.

From the *Shasta Herald*, we have just heard of a recent meeting of the miners of Lower Spring District, in that county, to ascertain their sentiments in regard to the encroachments of Chinese on the boundary of that district. Some time ago they made a local law that "No Chinaman shall be allowed to work in these diggings under any circumstances whatever; and it shall be the duty of every person to use his best endeavors to keep the evil of Chinamen from our mines." This, however, seems not to have had the desired effect; and at the meeting referred to, it was considered expedient to adopt a resolution: "That we, the miners of this precinct, positively forbid the working of any Chinaman in, or on the grounds of the same, and will prevent them from so doing, by all the means in our power—forcibly, if necessary"; which was accordingly adopted unanimously.

We have no hesitation in endorsing this proceeding, and recommending the miners throughout the State to not only pass similar resolutions, but act upon them. They should determine to rid themselves of these nuisances—peaceably if possible, but forcibly, if they must—and carry out such determination to the very letter.

It is bad enough that the Chinese should come to our State, dig our treasure, give what little they spend of it to none but their own countrymen, and send the rest to China, never to be returned in any available shape; but when they swarm upon our river-bars and creeks, to the exclusion of "poor white folks," who would gladly work them, the evil becomes unbearable. Australia is beginning to arouse herself in this matter also. The miners there are much excited upon the subject, and very naturally. They are opening their eyes to the facts that her gold is being drained away to the aggrandisement of lazy mandarins in the Flowery Kingdom; that the Chinese are moral pests, unfit to associate or labor beneath the same skies with the free white man; that the competition between free and coolie labor is disastrous to the former; and that if such a state of things is much longer suffered to exist, the proper owners and workers of the mineral lands must ultimately retreat before the constantly increasing myriads of Asiatic pests, or starve. They have wisely determined to drive the coolies away from the diggings, as have those of California. We trust that our mines will be entirely rid of them, and that ere many more years pass away, the last lingering vestige of the detestable race shall have been swept from our Golden shores. They are a mildew, a blight and a curse to every land in which they set foot; and we are much mistaken if the spirit of tolerance in our midst, does not shortly expire, and their insolent presumption receive such chastisement as may live in the memories of their kinsmen as a perpetual terror. Californians have suffered long, but their patience and forbearance are nearly exhausted.

A HINT TO OUR MOUNTAIN CONTEMPORARIES.

The interior papers teem with accounts of Union meetings, Union resolutions and extracts from patriotic speeches. These and the news from the seat of war in the East constitute their principal contents. There is nothing in this to complain of. We like to see it; and no doubt the people subscribing for those journals, desire above all others, that kind of mental pabulum; but we desire to call the attention of our contemporaries to something they seem to overlook in the present excitement. It is this: that in consequence of the anticipated horrors of civil war, many, very many thousands of our Eastern brethren are now contemplating the policy of migrating to Golden California—the only State, save one, in the whole Republic that enjoys, and will continue to enjoy, the most perfect immunity from the terrible effects of the bloody and devastating conflict recently inaugurated. Most likely these thousands of our fellow citizens are balancing in their minds the comparative merits and allurements of this State, with those of Oregon and Washington Territory. It is highly desirable then, that the elements of our prosperity should be spread out before them, so that they may make choice of California for their future homes. Our agricultural and other yields—but that of our Mines more especially—should be provided for their perusal; and it is in a great measure on this account, that we have commenced to glean and condense from the interior Press, and other sources, all the reliable mining intelligence that we can obtain. If our mountain contemporaries will pay a little more attention to this matter, the MINING AND SCIENTIFIC PRESS will be enabled to publish a weekly summary of mining, that shall be a faithful reflect of the results of that important branch of industrial enterprise, the perusal of which will not only bring thousands of families hither, but also furnish valuable and interesting information to those who already live within the borders of our growing and prosperous State. If the interior Press will only do this, they will share with us the pleasure of adding to her material advancement.

ADVICE TO MINING TOWNS.

The dry season having set in, we deem it our duty to call the attention of our mountain friends to the necessity of guarding the towns in which they reside, from that dread summer visitant, *fire*. Formed, for the most part, of frame houses, our mining towns and villages have been yearly exposed to prostration and destruction by the fiery element. Many of them have fallen beneath its dread ravages in years gone by, and magically arisen, inspired with the new life and energy of the indomitable Anglo-Saxon race. We are proud of that unconquerable spirit, but we infinitely prefer to see no cause for its exhibition. A little precaution is all that is needed. In those towns where no fire department has been organized, let one immediately be formed. Most mining towns have large reservoirs of water near at hand. A covered sluice should be constructed, carrying this water to cisterns, built at convenient distances from one another in town. With the water at hand, and a few Hydropulps, many a devastating conflagration could be stayed, and much misery averted. A large supply of fire buckets should also be provided, and companies properly officered, drilled in the use of them. These, with hook and ladder auxiliaries, will, in a very great measure, insure safety during the dry season, when the incendiary thinks he is sure to accomplish his hellish work. With such means at their disposal, it would hardly be necessary for the residents of such towns to form night watches—but as "an ounce of prevention is worth a pound of cure," no means should be left untried to secure immunity from the destroying ravages of the fire-demon.

A VALUABLE WORK.—Our Library has been enriched by having Smith's "Dictionary of Arts, Sciences, and Manufactures," in two volumes; a most valuable work indeed, embracing nearly three thousand articles on arts and sciences, with three hundred and forty engravings. Many thanks to our friend, Dr. Irwin, for this useful present.

OUR WASHOE CORRESPONDENCE.—We have received from our special correspondent at Carson Valley, the first of a series of letters from his able pen, but owing to the press of other interesting matter, it will not appear until the next issue of the MINING AND SCIENTIFIC PRESS.

The fossil floras of France, England, Germany, &c., exhibit ferns nearly fifty feet high with branches nearly nine feet in circumference, proving that Europe possessed at one time a very high range of temperature.

THE NEW DAILY OVERLAND MAIL.—On Monday, June 1st, the Central Overland Daily Mail will commence running. The through time, from St. Louis, Mis., via Salt Lake City to Placerville in this State, is 16 days, excepting during the winter, when 4 days more are allowed. A correspondent of the *Sacramento Union* gives the stations and distances between Carson City and Salt Lake City, by which it appears that the latter is distant from San Francisco 836 miles. He proceeds: "I am informed that the Butterfield Company propose erecting intermediate stations every twelve miles, on account of the great number of horses required for the accomplishment of the journey within the specified time of sixteen days from St. Joseph to Placerville. The company will put on the road, probably, six hundred horses, twenty-five carriages and twelve conductors—altogether, station keepers and everybody, about one hundred and fifty men. When once in good working order, and everybody at his place, arrangements will be made at these chief stations, where there is changing of carriages, for travelers to be accommodated with the necessary means of "restauration in the shortest possible time."

THE OAKLAND LYCEUM.—It may not have been generally known that for some years past, a Scientific Association has been in existence across the Bay, under the title of "The Oakland Lyceum." The president is James Lentell, Esq.; Secretary, F. K. Warner, Esq., and Treasurer, John Ross, Esq. Among its prominent members are Dr. Newland, Rev. Dr. Bell, Rev. Henry Durand, Messrs. Bridges, A. Davidson, Blake and Hemphill. The standing committees or emperors on the various branches of science are: Dr. Newcomb, on Conchology, Mr. Bridges, on Botany, Rev. Dr. Bell, on Mental and Natural Philosophy, Mr. John Ross, on Geology; and Zoology, Chemistry and Commerce have each their exaltors. The meetings are held on the first Monday of every month, in the Oakland School House, for the discussion of various scientific subjects—when essays and lectures are frequently read. The example of these Oakland gentlemen might be followed with advantage in other parts of the State.

THE YO SEMITE FALLS.—Travel to the Yo Semite Valley, says the *Mariposa Gazette*, is increasing. It is the season of the year to go, as the Falls are high, though there is enough to be seen at any season to astonish and gratify the most captious of all tourists. We notice that parties frequently take along their bedding and provisions. It is not necessary, for good accommodations can be had in the Valley at moderate rates. Another thing, we see several parties going to the Yo Semite who have been up into Calaveras county to see Big Trees. Now it ought to be well enough known by this time that upon the direct route to the Valley are groves of these trees, as large and larger, and five times as numerous, as in Calaveras. One day's delay at Clark's Ranch, on the south fork of the Merced, 18 miles from the Valley and 23 miles from this place, is sufficient to see all that has ever been seen of "big trees."

NEW FACTORY.—A factory for manufacturing starch, British gum for ensuring the permanency of colors, leucogen powder, and glucas for the manufacture of syrups, excellent samples of which have been already turned out, has just been completed near North Point, and is designed to furnish the whole State with those articles. Already seven starch vats are in operation, from which three hundred pounds of a superior quality of that article are daily made.

The *San Andreas Independent* remarks the late severe hail storm that passed over a good part of Calaveras county, we are informed was quite destructive to the coming grape crop. Nearly a third of the branches in many localities were knocked off and destroyed. The destruction of a third of the grape crop of that county is no small item of loss to our gardeners and farmers. The recent hail and snow storm seems also to have hurt the peach and other crops, more or less.

STANDARD WEIGHTS AND MEASURES.—The following table of the number of pounds of various articles to a bushel, may be useful to our readers:

Of wheat, 60 pounds; of shelled corn, 56 pounds; of corn on the cob, 70 pounds; of rye, 56 pounds; of oats, 32 pounds; of barley, 40 pounds; of potatoes, 60 pounds; of bran 20 pounds; of clover seed, 60 pounds; of timothy seed 45 pounds; of flax seed, 45 pounds; of hemp seed, 44 pounds; of buckwheat, 32 pounds; of blue grass seed, 14 pounds; of castor beans, 46 pounds; of dried peasees, 33 pounds; of dried apples, 24 pounds; of onions, 57 pounds; of salt, 50 pounds.

WRINKLED silk may be rendered nearly as beautiful as when new, by sponging it on the surface with a weak solution of gum arabic or white glue, then ironing it on the wrong side.

SILVER ORE MACHINERY.—The *Folsom Telegraph* notices that ore machinery for the silver country arrives in Folsom in large quantities. The *Placerville Californian* states that loads of it are almost daily forwarded from that city.

STARVING.—The Indians on the Mendocino Reservation are said to be in a suffering if not a starving condition.

CALIFORNIA.

Los Angeles County.—From late correspondence in the Times, we learn that the news from the mines continues of the best description, although

MEXICO.

Chihuahua.—The adjoining State of Chihuahua is said to be richer yet than Sonora; but I don't want to believe it—there will be too many

NEVADA TERRITORY.

AUSTRALIA.

Correspondence from Rocky River, in the Northern Gold Fields, which we find in the Armidale Express, gives us the following information: The reports from Ironbark are very exciting. Gold is said to have been discovered in very payable quantities in shallow sinking. Some large nuggets are also said to have been found near the surface. Rich quartz reefs have also been discovered at a depth of four feet, yielding about twelve ounces to the ton. Some very rich specimens have been brought to the Rocky.

A Mining Town Transformed.

More ways than one, says the *Sierra Democrat*, to keep up a town. Gold was found at Sutter's Mill in 1848, and Coloma sprang up from the consequent excitement. The beautiful little valley was torn by pick and shovel, and later the whole available surface sluiced over and over till but sand and rocks was left. The hills were despoiled of their tall firs and taper firs which had for centuries adorned the "Beautiful View," meaning of the Indian word Colomal. The enterprise which attacked old Mountain's treasury at Sutter's mill-race, radiated in every direction over the State. Tall mountains have been gored at the summit, and tunneled through at the base. Deep ravines have been picked and sluiced down to mere drains for long tunnels. Broad valleys have been washed down to the bed-rock, and the washed boulders piled up of sand—the yellow skull and dry bones of the beautiful sward that the miner found.

While all this has been going on the old town has continued a sort of head quarters or rendezvous, for those who years ago left it for fresh diggings. Its good claims have been exhausted. Gardens grow where the pioneer plied the rocker, and flowers bloom where the old cotton tent stood. Now and then an old miner leaves the upper mountain diggings hereabouts, to take a look at the old town—the initial point of his mining adventures, since marked by the Gold Lake, Gold Beach, Kern River, Fraser River and Washoe craters. He goes to Coloma to look where the old mill stood, and try if he can distinguish the exact spot where he slept and cooked under a tree, and worked his ounce diggings. He goes to have a talk with Weimer, and Doc., Charley, Kim, Chap., and other '49ers, and to recollect how he felt when he left the States, and what grand times he had with the '49ers, before men commenced to steal, and murder, and rob sluices for gold, or to shoot each other in quarrels about women.

Well, that isn't what we meant to write about. Coloma has not gone down like other towns, for lack of gold diggings. Her hills are clothed with choice vines, and the valley, full of finest fruit trees, blossoms like the rose. Tuns of fruit and many gallons of wine and brandy are annually sold. The good people seem to have turned their attention from mining to the cultivation of the sweets of life, and the beautiful—grapes, peaches, pears, pretty girls, wine, brandy, honey, and the like.

Philosophy of Bathing.

Among the ancients, the Romans reveled in baths, and among the moderns, no nation excels the Turks in the fitness, perfection and luxuriousness of their bathing establishments. With great wisdom, Mahomet made frequent ablutions a necessary religious ceremony; for these insured health to the body. In the skin which covers our frame are 7,000,000 minute pores, through which full five-eighths of all that is eaten must pass, to keep a man in good health. By frequent washings these pores are kept open and clean, and by neglect many of them become clogged, and partial or wholly closed, causing a variety of diseases to supervene. Nature keeps the interior soft and clean, and exudes to the surface, through these orifices, all the refuse matter for removal by evaporation and bathing. As all parts of the skin has pores, as well as the face and hands, through which this effete matter is pushed to the surface, all the body should be well washed at least one-third as many times as those are.

Many diseases are almost instantly cured or relieved by bathing. Severe diarrhea is frequently checked in this way, and diseases of the blood and the most virulent types of smallpox have been completely cured by this simple remedy. In the last epidemic at Charleston, of several Northern mechanics, but one escaped, and he alone was accustomed to bathing frequently. Abernethy's advice to a wealthy patient, on one occasion, was: "Let your servant bring to you three or four pailsful of water, and put it into a washtub. Take off your clothes, get into it, and you will recover." "This advice of yours," exclaimed the astonished patient, "seems very much like telling me to wash myself!" "Well, it is open to that objection," quietly replied Abernethy. Dr. Crook, a student of Sir Astley Cooper, once poisoned a dog, which immediately plunged into a neighboring river, and remained some time with his body entirely submerged, after which he left his watery hospital and ran home cured. Dogs have been repeatedly cured of hydrophobia by holding them in water.

Dr. Currie declares that long and careful experience has demonstrated that bathing prevented or cured the most of diseases to which we are subject. Almost the whole secret of the success of Thomsonian physicians, and many empirics of other grades, may be found in their efforts in opening the obstructed pores of the body and causing perspiration. Priessnitz, the founder of the watercure system, made bathing a *sine qua non*, and no man was ever more successful in eradicating disease than he.

CURE FOR THE RHEUMATISM.—Bathe the parts affected in water in which potatoes with the skins have been boiled, as hot as can be borne, just before going to bed; by the next morning the pain will be much relieved, if not removed. One application of this simple remedy has cured the most obstinate rheumatic pains.

SUN BLEMISHES.—The Honkong Press of the 2d of April calls attention to the fact that two large black spots on the sun are visible to the naked eye just before sunset.

Live Cattle Weighed by Measure.

THE only instrument necessary is a measure with feet and inches marked upon it. The girth is the circumference of the animal just below the shoulder blades. The following contains the rules to ascertain the weight of an animal:

If less than one foot in girth multiply superficial feet by eight.

If less than three feet and more than one, multiply superficial feet by eleven.

If less than five and more than three, multiply superficial feet by sixteen.

If less than seven and more than five, multiply superficial feet by twenty-three.

If less than eleven and more than nine, multiply superficial feet by forty-two.

Example: Suppose the girth of a bullock to be six feet three inches; length, five feet six inches, the superficial area will then be thirty-four; and in accordance with the preceding rule the weight will be 782 pounds.

Example: Suppose a pig to measure in girth two feet and length one foot nine inches. There would be three and a half feet, which multiplied by eleven, gives thirty-eight and a half pounds as the weight of the animal when dressed. In this way the weight of the forequarters can be substantially ascertained during life.

INFINITESIMAL.—Among the papers published in a costly style by the Smithsonian institute, Washington, is one on the microscopic plants and animals which live in and on the human body. It describes quite a number of insects. The animal which produces the disease known as the itch, is illustrated by an engraving half an inch in diameter, which shows not only the little fellow's body and legs, but his very toes, although the animal itself is entirely invisible to the naked eye. When Lieut. Berryman was sounding the ocean preparatory to laying the Atlantic Telegraph, the quill at the end of the sounding line brought up mud, which, on being dried, became a powder so fine that on rubbing it between the fingers it disappeared in the crevices of the skin. On placing this dust under the microscope, it was discovered to consist of millions of shells, each of which had a living animal!

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Considerable activity in mining sales during the last ten days up at Virginia City!

Potosi, \$200 per share.
Central, \$700 per share.
Ophir, \$1100 per share.
Gould & Curry, \$300 per share.
Chollar, \$8 per share.
Lucerne, \$25 per foot.
St. Louis, \$6 per foot.
Mount Davidson, \$40 per share.
Mark Anthony, \$8 per foot.
Louise, \$16 per foot.
Bradley, \$8 per foot.
Sacramento, \$6.
Shelton Co., \$5 per foot.
Josephine, Flowery, \$8.
West Branch, Flowery, \$8.
Harrison, Flowery, \$12.
Yellow Jacket, \$40.
Exchange, East Comstock, \$25.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$18.
Hard-Up, \$5.
Chimney rock, \$12.
Dargen, \$10.
Rich Co., \$3.
Miller, \$6.
Costa Rica, \$5.
Spanish Co. Plymouth Ledge, \$8.
Chelsea, \$6.
King Charles, at Howery, \$6.
Great Western Ledge, Helena, \$10.

Number of Shares to the Foot.
Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.

[Having completed all the requisite arrangements, we shall in future be able to lay before our readers a reliable list of prices of mining stocks of Utah.]

DOWS' DISTILLERY,

SAN FRANCISCO.

THE PROPRIETOR OF THE ABOVE ESTABLISHMENT IS NOW MANUFACTURING about 300 gallons of WHISKY daily, and is prepared to furnish the trade with ALCOHOL, PURE SPIRITS and HIGH WINES, of a quality equal, if not superior, to any imported, as Wheat alone is used in their manufacture. Purchasers can be supplied with lots to suit at the depot, No. 214 Sacramento street. (mh8) E. T. PEASE, Proprietor.

STORY OF AN OIL MINE.—There are numerous oil stories going the rounds, and among them none are better than this, told by the *Wheeling Intelligencer*:

A darkey was superintending the boring of a well one night, the proprietor being anxious to complete the work and therefore laboring night and day. The weather was cold, and a fire was burning near the mouth of the well. About midnight a vein of gas was struck, and, ignited by the fire, shot up a brilliant flame in the air, illuminating the whole scene. The darkey, who almost turned white with fear, broke for his master's house, yelling: "Get up! massa Thompson, get up! We've broke through into hell!"

Our Big Guns.

The Columbiad or Paixhan (pronounced Pay-zan) is a large gun, designed principally for firing shells—it being far more accurate than the ordinary short mortar. It is capable of projecting a solid shot or shell with a large charge of powder, and at an angle of five degrees below to forty-nine degrees above the horizon. It may be said to combine the essential qualities of the gun, the howitzer and mortar.

A Dahlgren gun is an ordinary cannon, except that it is always very thick at the breech for several feet, when it tapers down sharply to less than the usual size. This form was adopted in consequence of the experiments of Capt. Dahlgren, of the U. S. Navy, having shown that when a gun bursts, it gives way usually at the breech. The *Niagara* armed with these guns, and at the Brooklyn Navy Yard there are sixty, weighing about 9000 pounds each, and six of 2,000 pounds each, the former of which are capable of carrying a nine-inch, and the latter a ten-inch shell, at a distance of two or three miles; and there is one gun of this pattern which weighs 15,916 pounds, and is warranted to send an even-inch shell four miles.

A barbette gun is one which is placed on the top of the fortification.

Cure for Cancer.

Boil Turkey figs in new milk, which they will thicken; when they are tender, split and apply them as warm as they can be borne to the part affected, whether broken or not; the part must be washed every time the poultice is changed, with some of the milk; use a fresh poultice night and morning, and at least once during the day and drink a quart of a pint of the milk the figs are boiled in twice in the twenty-four hours. If the stomach will bear it, this must be persevered in for three or four months at least. A man aged 105 years was cured about six years before his death with only about six pounds of figs. The cancer, which began at the corner of his mouth, had eaten through his jaw, neck, and halfway down his throat; yet he was so perfectly cured, as never to show any tendency to return. Should it ever do so, the figs should again be applied. The first application gives a great deal of pain, but afterwards each dressing gives relief. A woman cured by this remedy has been afflicted ten years; her breasts bled excessively; ten pounds were removed.

CURIOSITIES OF THE EARTH.—At the city of Moden, Italy, and about four miles around it, whenever the earth is dug, when the workmen arrive at the distance of sixty-three feet, they come to a bed of chalk, which they bore with an auger five feet. They then withdraw from the pit before the auger is removed, and upon its extrication, the water bursts through the aperture with great violence, and fills the newly-made well, which continues full and is affected neither by rains or droughts. But what is most remarkable in this operation are the layers of earth as we descend. At the depth of fourteen feet are found the ruins of an ancient city, paved streets, houses, floors, and different kinds of mosaic work. Under this is found a soft, oozy earth, made up of vegetables, and at twenty-six feet deep, large trees, entire, such as walnut trees, with the walnuts still sticking to the stem and the leaves and branches in a perfect state of preservation. At twenty-eight feet deep, a soft chalk is found mixed with a vast quantity of shells, and this bed is eleven feet thick. Under this vegetation is found again.

AN EXONERATION DENT.—If the revolving Southern States ever achieve independence—which is barely possible—it is proposed that the following bill shall be presented to the Southern Confederacy by the United States Government: Louisiana (purchased of France).....\$ 15,000,000 Interest paid on above.....8,385,353 Florida (purchased of Spain).....5,000,000 Interest paid.....1,430,000 Texas (boundary).....10,000,000 Texas (for indemnity).....10,000,000 Texas (for creditors, last Congress).....7,750,000 Indian expenses of all kinds.....5,000,000 To purchase navy, pay troops.....5,000,000 All other expenditures.....3,000,000 Mexican war.....217,175,565 Soldiers' pensions and bounty lands.....7,090,000 Florida war.....100,000,000 Soldier's pensions.....7,000,000 To remove Indians.....15,000,000 Paid by treaty for New Mexico.....15,000,000 Paid to extinguish Indian titles.....100,000,000 Paid to Georgia.....3,082,000

Total.....\$617,822,928

SPRING TIME.—The hills surrounding the town (Downville), says the *Citizen*, have a magnificent dress of green, and the air is filled with the fragrance of the blossoms which adorn their sides.

MICHIGAN BLUFFS.—About eighty acres, including half of the town of Michigan Bluffs, Placer county, having been undermined by miners, has caved in and slid downwards towards the river, and it is feared that more will follow.

CELESTIAL DIET.—The *Shasta Courier* tells us that last week was noted for the capture and sale of thirty-six rats to the celestial gentlemen of that city.

PACIFIC FOUNDRY AND MACHINE SHOP. First Street, between Mission and Howard, San Francisco, California.—By recent additions to our heretofore extensive establishment, we can confidently announce to the public that we now have

The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and stationary; Straight Quartz Mills of all sizes and designs; Stamp Shoes and dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months; Mining Pumps of all sizes and kinds; Flouring Mills; Gang Saws, Malax, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hannan's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia iron; Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Steam Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight

of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe.
Barstow Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco.
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
2d. Having two driving wheels, if one slips the other does the work.
3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.

5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.

7th. The cutter-bar being hinged to the machine, can be packed up with out raising the belt or screw.
8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.

9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
10th. It has no side draft.

11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchasing. KNAPP, BURRELL & CO., ap19 310 (Old No. 80) Washington street, near Front, San Francisco.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Mun & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts. 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$5. For arguing the case in the event of a rejection, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as a gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

[For the Mining and Scientific Press.]

Geological Constitution of the Sierra Nevada.

BY AUGUSTE REMOND.

On the other side of Abbey's Ferry the metamorphic limestones rise to the height of 1,000 to 1,800 feet above the level of the Stanislaus river; they lie upon the granites and form irregular layers more than 600 feet thick. Some of them are in a state of decomposition. It is in this kind of rock are met those caves and caverns filled with such pretty stalactites, and which attracted so much attention from their containing Indian bones, discovered some years ago. From time to time, in the county of Calaveras, I found on the slopes of those marble mountains, masses of lime entirely crystallized and sometimes slightly colored with green and yellow. Some of the specimens I secured, when analyzed by Dr. Snell, proved to be both lime and baryta.

One may say, without error, that the crystalline limestone extending like a long belt on the Sierra Nevada, form the demarcation line between the schistose strata and the granite formations.

The granites and the sienites, which much resemble them, appear at Sonora. Beyond this town, Bald Mountain, from the summit of which the Mount Diablo range is seen, is but a granite mass, traversed westward by veins of milky quartz; at its base extend micaschists and some metamorphic gneiss. This last rock is also found on the side of a hill a quarter of a mile from Sonora; specimens of it are now in the scientific cabinet of this town.

Sometimes the sienites, which cover large surfaces on the Sierra Nevada, are exclusively made of grains of orthoclase (glassy felspar), scattered through a greenish and a little crystalline base of amphibole. Actinolite is found in long and slight green crystals in the cavities of these rocks. At other times, the orthoclase forms the principal compound of the sienites, and hornblende is met with in flat and elongated crystals. The felspar often disappears, and in this case the rock passes into amphibolite, as may be seen near Abbey's Ferry.

As for the granites, they are much different from each other, and every locality, if I may so speak, has its own. The most common are a compound of quartz and felspar, filled with small spangles of black mica. Very often the surface of them is decomposed and in a crumbling state, forming hills of a peculiar rounded form, or surmounted by piles of stones which are sometimes like heaps of boulders. On the southern banks of the Stanislaus, those igneous rocks are stratified and in almost horizontal layers, being but slightly lifted up to the north. This is a proof that the primitive matter became cool very slowly. In certain places the granites are covered with rocks entirely felspathic. They also undergo a change, but their decomposition is not so perfect as to be used for kaolin. It is very easy to see that the granites of the Sierra Nevada chain are of two different ages. The older are generally greyish in color and contain much quartz; in the newer, orthoclase predominates, and gives to the mass a white color spotted with shining black mica, as is observed near Soulsbyville and on the sides of Bald Mountain. The sienites and granites often include large crystals of felspar; in this case the rock is porphyritic and passes into porphyry.

All these phetonic rocks are steeper and steeper as one goes on through the mountains, and form the main body of the Sierra Nevada. They are traversed by metalliferous quartz and glassy felspar (orthoclase) veins, which, from south to north, follow each other in almost parallel lines.

The first of these veins are the most common and the most important, because gold is generally found in them in larger or smaller quantities; they were formed much sooner than the quartzites or metamorphic quartz of the schists. The gold they contain is sometimes so fine as to be invisible to the naked eye; at others, the quartz, when broken, is completely studded with the glittering particles. If gold is found in quartz veins it does not prove that it was originally formed in that rock or together with it; for, says Sir Charles Lyell,* gold has now been detected in almost every kind of rock. In slate, quartzite, sandstone, limestone, granite and serpentine, both in veins and in the rocks themselves at short distances from the veins. The presence of this precious metal in the alluvial deposits is to be attributed to the gradual degradation of the gold-bearing rocks by water and atmospheric influences, which distributed the gold over this country. In every part of this mining region the quartz veins are seen cropping out. They are very irregular in their mode of formation; sometimes they rise up like enormous walls more than 60 feet high, then suddenly sink down into the bowels of the earth to incalculable depths. Those crystals of quartz (or pure silica) which so well decorate collections, are found in the cavities or pockets of these rocks. The quartz very often contains pyrites and sulphuret of lead which crystallizes in steel gray cubes. Here, it is to be remarked that galena always contains silver as sulphuret of iron contains gold, but both are in so small a quantity that it is too expensive to take them out.

The veins of glassy felspar attract notice in the vicinity of Kinead flat and Soulsbyville. Orthoclase, when pure, is

white, and presents pearly reflexis which are very agreeable; but generally it is colored and tarnished by other substances. These felspars, in some localities, are filled with plates of white mica, crystals of garnet and of tourmaline. The sward silicates are in small red twelve-sided crystals; this stone is a little similar to the rubies found throughout the Sierra Nevada in the sand and gravel of river beds, and which are very fine, but generally very small. The third silicates are always crystallized and of a beautiful shining black. Sometimes the crystals are capillary, at others they are very large. I measured some of them which were two inches in diameter and six inches long. All the rocks are fine specimens for mineralogical cabinets.

The metalliferous deposits scattered within those crystalline rocks contain almost all the most important metals; gold, silver, platinum, manganese, are found in them; magnetic iron or loadstone is common, and the carbonate of iron (sideros) is also met with. Near Conlsterville, cinnabar (sulphuret of mercury) is in small crystals of a small scarlet color; fine antimony, lead, copper, when sulphurets, form the minerals named blende, stilbite, galena, chalkosine, and are found in the Mariposa country. The two carbonates of copper, malachite and azurite, must take place with the above mentioned metals. Certain quartz which present fine green and blue tints are colored by those carbonates.

The volcanic rocks of the Sierra Nevada contribute to its formation; they are less ancient, but the most irregularly scattered. They have pierced through the different formations, and in some places covered them, as was the case at Table Mountain. With these igneous rocks, we must rank those vast plateaux of trapp which are found principally to the north on the Sierra Nevada chain, and all the volcanic cones, with lava and scoria. I shall notice but Lassen's Butte. Its summit is distinctly crateriform, and it is a volcanic cone whose fires have not long been extinguished; it has an altit de about 9,000 feet and is covered with piles of lava and ashes. The craters of the coast range are probably of the same age, having a similar character. In many places of the Sierra are seen traces of an intense and recent volcanic action; here and there the surface is covered with blocks of scoraceous trapp, pumice, trachyte, porphyry or felspathic lava.

It is not very uncommon to find obsidian* in the vicinity of those volcanic rocks; this stone is probably the result of glassy felspar vitrified by the heat of those ante and post-Tertiary volcanoes.

In several places along and beneath Table Mountain are thick beds of a gray aluminous clay, which forms a good kind of marl. These argillous deposits occupy the bottom of a small flat between Shaw's flat and Whintown. Strata of this character are not rare on the Sierra Nevada, and are the beds of ancient lakes.

Near Texas flat and Abbey's Ferry, the calcareous tufas are seen forming deposits, 70 or 90 feet thick. They assume every kind of arborescent and stalactal shape, and are perforated with caverns and grottoes of the most curious aspect; the carbonates of lime were formed before this epoch, and seem to have been lifted up and broken in many places; their position above the level of the Stanislaus River is to the height of 1,900 feet. Westward, half a mile from Springfield, and on the side of Table Mountain, calcareous tufas of the same age are mixed with clay, and form what is called *calcareous marls*.

All the rocks and formations which I have just spoken of, are more or less covered with the detrites and alluvial deposits which increase every day and are divided from the degradation of the mountains by air, water or other physical causes. It is from the sands, gravels or clays of these alluvions that so many fortunes have been taken out.

* Volcanic glass.

By what has been said, it is seen that the Sierra Nevada contains great riches. It has fine quarries of blue and white marbles. Its schists can be used as roofing slates, building and flag-stones; the granites and sienites form also very good stones for erecting durable buildings. The gold mines are far from being exhausted, and contain many useful minerals. With this let us place the marls which, as every one known, are a very rich manure.

Mechanical Baking.

We present in this issue of the MINING AND SCIENTIFIC PRESS, an engraving of the Pacific Mechanical Bakery, situated on Bush street, between Montgomery and Kearney sts. It is the only bakery of the kind on the Pacific Coast, and its labor-saving machinery, which enables the proprietors to make bread, biscuits and crackers of every kind, in the best possible manner, and at very low rates, is worthy of description; and we accordingly present to our readers, that furnished by the inventor, Mr. Wm. R. Nevins.

The flour is sifted through a sifting machine; then it is put into the mixing machine. The dough mixing and kneading is not only accomplished by this, thoroughly and properly, but also, continuously, and of any consistency required, subject to the will of the operator, at the rate of one barrel of flour in every fifteen minutes, with comparatively little power. The dough is then put through a preparatory machine, which rolls it to its proper thickness, and carries it to the feeding board of the bread, biscuit and cracker machine. This machine rolls out the dough, and cuts it into loaf bread, ship biscuits, and crackers of every description. The said machine combines the rotary with the reciprocating and intermittent progressive motion, to correspond with the speed of the oven's bottom, so that as the dough is rolled and cut into breadstuffs, it is carried forward by the apron of this machine to the end of the stretchers, which extend into the mouth of the oven. The oven has an endless bottom, made of metallic plates, revolving at the same speed as the apron of the biscuit machine. The oven is very simple in its construction, but durable and complete in its operation. After suitable fires are built in the furnaces, at either side of the bridge wall, the endless apron is set in motion, and the cakes of bread, biscuit or crackers, successively follow one another through the oven—entering dough and coming out bread. This machinery makes a saving of at least fifty per cent. in the cost of making breadstuffs, and the Pacific Mechanical Bakery, we need hardly say, is well patronized.

NOTICE.—PERSONS HOLDING PRIZE TICKETS TO THE LAST TOMBOLA drawn last Saturday, at the Ladies' Festival at the Willows, will have to present the same at the office of Messrs. Fleche & Beyerque, within twelve days from this date. A failure to comply with the above request will be considered as a forfeiture of the Prize, which will be turned into the funds for the benefit of the Church.
SAN FRANCISCO, June 11th, 1861.

PURE NATIVE SONOMA WINES.

RED, WHITE AND SPARKLING.

From Lachryma Montis Vineyard.

MANY FAMILIES AND OTHERS BEING DESIROUS OF PROCURING MY Wines, and having now a large quantity accumulated of the vintage of the last five years, I have determined on introducing them into the market, for which purpose I have appointed A. S. Lowndes & Co. my sole agents, of whom the wines may be obtained in their pure state, as they come from my vaults in Sonoma.
M. G. VALLEJO.

At the Depot, 617 Montgomery street, from this time we shall have in store a constant supply of all classes of the Lachryma Montis Wines, and parties purchasing from us may rely on obtaining the pure offspring of the grape. First Premiums and Diplomas have been awarded to Gen. Vallejo for specimens of his Wines, exhibited at the various Fairs held in the different parts of the State during the past four years, and having now obtained some age, are for the first time brought into market. As dinner wines, and a general healthy beverage for this climate, the Lachryma Montis Wines cannot be surpassed. For sale in quantities to suit by
A. S. LOWNDES & CO., Agents,
617 Montgomery street, opposite Montgomery Block, San Francisco.

A SPLENDID OPPORTUNITY.**AGRICULTURAL MACHINERY.**

As I have taken, for five years, a large portion of the State Prison Labor, for the sole purpose of manufacturing AGRICULTURAL IMPLEMENTS AND CABINET WARE

I offer for sale, at a Great Sacrifice, in order to close out my present stock by September First, 1861, the following articles:

TWELVE-HORSE STEAM THRESHERS;
C. M. RUSSELL'S EIGHT AND TEN-HORSE THRESHING MACHINES,
J. A. PITT'S GENUINE MACHINES, FOUR, SIX, EIGHT, TEN AND
TWELVE-HORSE POWER, with all of C. M. Russell's Latest Improvements;
HAY PRESSES, REAPERS AND MOWERS;
EXTRA TRUCKS for Threshing Machines and WIRE TOOTH BUGGY HORSE RAKES.

All of the above goods will be sold at the Lowest Prices, either for Cash, or good approved paper at a low rate of interest.

THOS. OGG SHAW.
33 Sacramento Street.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. III.

SAN FRANCISCO, SATURDAY, JUNE 22, 1861.

NO 13.

It was shown by Dalton that the appearances presented by the Aurora could be explained by supposing the existence of *horizontal bands* of luminous matter nearly at right angles to the magnetic meridian and of *columns parallel to the dipping needle*,—the former constituting the auroral "arch," and the latter the "streamers"—and he suspected that the streamers either stood upon the arch, or depended from it.

Subsequent observations have confirmed the reality of these bands and columns, and have shown that, ordinarily, the streamers stand upon the arch as a base. When the arch is nearly overhead we see the streamers through it, as through a curtain, and have no means of determining which is the more distant, both being in the same direction from the eye. But when, as more frequently happens, the whole display lies far to the north of us we can observe clearly the relative position of the parts. We then see an arch stretching over the northern horizon, with streamers standing upon the arch and not extending below it. The tops of the streamers may be at very unequal elevations but their basis will generally be found arranged in the regular curve of the arch—although when there are two concentric arches the streamers from the lower may appear to extend into the upper and thus render the phenomena more complicated.

The auroral arch as seen over the northern horizon is generally a perfect and regular arc of a circle, its highest point being nearly on the magnetic meridian and its extremities resting upon the horizon. This being true in all longitudes where observations have been made, it necessarily follows that the arch is always part of a circle, the centre (or rather the pole) of which corresponds very nearly to the magnetic pole of the earth.

In the great display of August 28th, 1859, the arches seemed to centre in the northeast as seen from California, nearly in the north from Philadelphia. So that there is great reason to suppose they were rings, more or less perfect, surrounding the north magnetic pole, and parallel to the surface of the earth beneath them.

In the Journal of the Franklin Institute for November, 1859, I gave what appeared to me satisfactory evidence that on that occasion at half past 9 p. m. the most southern of these rings was about three hundred miles wide (its northern margin being vertical over Newburyport, Mass., and its southern over Frederick, Maryland), and that it was about 42 miles from the earth—also that streamers near 580 miles in length and several miles in diameter, springing from this ring as a base, extended to a height of near 600 miles from the earth, the tops of the most southern streamers being vertical over Norfolk and being distinctly

THE AURORA*

Viewed as an Electric Discharge between the Magnetic Poles of the Earth, modified by the Earth's Magnetism.

DESCRIPTION OF PLATE.

VI, FIG. 1.

N and S—The North and South magnetic poles of the earth.

The East and West bands represent Auroral Arches, upon which stand the streamers. The dotted lines represent magnetic curves, and the arrow on one of the arches shows the direction in which the streamers, and the components of the arch revolved on the 28th of August, 1859.

V, FIG. 4.

N and S—The North and South magnetic poles of the Earth.

n and s—The poles of an imaginary magnet representing the magnetism of the earth.

A, A', B, and B'—Points on the surface of the earth.

ab, ed, a'h', c'd' &c.—Auroral streamers.

of and e'f'—Sections of Auroral arches.

Z—The direction of the zenith to an observer at A.

The arrows show the position of the dipping needle at the several points A, A', B and B'—and the dotted lines represent the magnetic curves passing through A and B.

An observer at A sees a corona having its centre at a—the streamer ab being seen endwise as a mere spot of light, and the streamers surrounding it appearing to diverge from it in all directions.

An observer at B sees a corona having its centre at c.

Fig. 2—Is copied from Gassiot's figure.

Fig. 3—Represents an imaginary modification of the same experiment.

visible from Havana, where they extended 23 degrees above the northern horizon. These streamers had a rapid but steady motion from east to west, that is they revolved around the north magnetic pole of the earth in that direction.

In this case then the lowest part of the auroral display being more than forty miles from the surface of the earth, where the rarity of the air must be fully equal to that attainable with the best air pump, and the highest, extending far beyond what is ordinarily supposed to be the extreme limit of the atmosphere, it must be very difficult to imitate the whole phenomenon experimentally even if the subject were fully understood. But I desire to call attention to the very striking agreement between some of the essential features of the aurora, and phenomena observed by Plucker and Gassiot in their recent investigations in reference to the electric discharge in vacuo.

Prof. Plucker, of Bonn, in a series of experiments on "the action exerted by a magnet on the luminous electric discharge passing through a tube or other glass vessel which contains residual traces of any gas or vapor," by passing the discharge from an induction coil through large Torricellian vacuum-tubes "of a cylindrical shape into which long wires enter from both ends," has succeeded in showing that the electric light passing from the negative wire towards the positive is "bent by

the magnet into curves and surfaces."

He says (Proceedings of Royal Society, vol. x, No. 38, p. 285) "The magnet acts on this light in a peculiar way, having no analogy with phenomena hitherto observed. I easily discovered the law giving in all cases the exact description of this phenomenon. The light emanating from any not isolated point of the negative wire and diverging in all directions towards the interior surface of the surrounding tube is bent by the action of the magnet into the magnetic curve which passes through this point."

"Such a curve is the only one along which an electric current can move without being disturbed by the magnet. It equally represents the form which a chain of infinitely small iron needles absolutely flexible, and not subjected to gravity, would assume if attached with one of its points on the points of the negative wire. It is well known that a magnetic curve is completely determined by one of its points. Therefore the whole light starting from all the different points of the negative wire will be concentrated within a surface generated by a variable magnetic curve."

[To be concluded in our next.]

SNAKE.—A Tebama correspondent of the Union tells of a large sea-serpent seen in the Sacramento river! It was eighty feet long, with a body twice the size of a man's, and head as large as a quarter cask.

McCARTHY'S AUTOMATIC SAFETY VALVE.—See Eight page.

* Benjamin V. Marsh, in American Journal for May.

WATER-WORKS OF PHILADELPHIA AND NEW YORK.—The water-works of Philadelphia now supply about 65,000 water-renters, at \$2 50 each and upwards, according to the number of openings in the pipes. The entire receipts into the department for water and pipe amount to about \$550,000 annually, giving a net income to the city of nearly \$200,000. In New York there are but 50,000 water takers, and they have to pay, exclusive of water pipe, which is paid for out of a loan, \$750,000 annually, the rents being \$10 and upwards. With this large revenue there is every year a large deficiency. Though the works of Philadelphia are very complete, the rapid spread of the city, and the continual erection of new buildings in the outer wards, have tested their capacity to the utmost in warm weather to supply the increasing demand. Councils, in examining into the subject, concluded to enlarge the works at Fairmount by the erection of a new millhouse of sufficient capacity to contain three of the largest sized turbine wheels, by which the power at Fairmount would be doubled, and for years prevent any scarcity in the supply of water. The work was commenced, and the foundations for the buildings completed; but in doing this the appropriation made for the work was exhausted, and councils have just passed a loan bill of \$425,000 to finish the job.

THE GREATEST WATER FALLS IN THE WORLD.—At a meeting which took place shortly after the recent launch of the steamer "City of New York" at Glasgow, it was mentioned that Mrs. Livingstone had two hours previously, received a package of letters from her adventurous husband, dispatched from the embouchure of the Zambesi river. Dr. Livingstone and his party had returned to that point, all well, after having accomplished an arduous and successful exploration into the interior of Africa in that latitude. The results of that journey had exceeded his most sanguine expectations, founded, as these were, on previous geographical knowledge. The Victoria Falls, as they have been termed, he had deduced to be 100 feet in height, and about 3,000 in width. When he was enabled to survey the actual scene, he ascertained that the height was 310 feet and breadth about 5,580, [the height of Niagara, on the Canadian side, is 149 feet, and the breadth 2,100 feet; on the American side the height is 102 feet and the breadth 1,025 feet]. The Victoria Falls are therefore, about twice the height and 2,455 feet broader than the united cataracts of the western world.

THE CURATIVE EFFECTS OF GRAPES.—Dr. Herpin, of Metz, has published a very interesting account of the curative effects of grapes, in various disorders of the body. They act, firstly, by introducing large quantities of fluids into the system, which, passing through the blood, carries by perspiration and other excretions, the effete and other injurious materials of the body; secondly, as a vegetable nutritive agent, through the albuminoid of nitrogenous and respiratory substance, which the juice of the grape contains; thirdly, as a medicine, at the same time soothing, laxative, alterative, and defervative; fourthly, by the alkalies, which diminish the plasticity of the blood, and render all more fluid; fifthly, by the various mineral elements, such as sulphates, chloride, phosphates, etc., which are an analogous and valuable substitute for many mineral waters. Employed rationally and methodically, aided by suitable diet and regimen, the grape produces most important changes in the system, in favoring organic transmutations, in contributing healthy materials to the repair and reconstruction of the various tissues, and in determining the removal of vitiated matters which have become useless and injurious to the system. Directed by a skillful physician, this valuable curative agent can be made to produce the most varied effects on the constitution. It also possesses the advantage of being acceptable to most invalids. The treatment lasts from three to six weeks. The quantity of grapes that may be consumed varies from one to four pounds a day, commencing with small quantities, which are gradually increased. The skin and seeds must not be swallowed. In the absence of grapes, the most beneficial effects may be obtained from dried raisins, provided a quantity of water, sufficient to satisfy the thirst they excite, be taken at the same time; or they may be stewed in the same manner as prunes.

AMERICAN GENIUS.—A story is told to us, and a true one, which will illustrate the resources of American genius. We will re-tell it: Last week Messrs. Ostrom and Vanracken, of Omega, in this county, started out on a hunting expedition. When some miles from the point of departure, and while walking on a slope of the South Yuba Canal, stepping from one tie to another, Vanracken fell and injured his hip severely, so that he could not walk. The hunters were far from human habitation and help. Ostrom set his wits to work and was soon moving his companion homeward. Not being strong enough to carry the wounded man, he procured a board and succeeded in dragging him on it across the ties to the ditch. Here he built a raft and laid Vanracken on it. Unfortunately there was not water enough in the canal to float it with its burden. Ostrom procured a board of sufficient length to reach across the ditch from bank to bank, and going some rods down the stream, he dammed the ditch with it till the water flowed back and rose high enough to float the raft. The cargo came down to the dam. Then going farther down he constructed more dams or locks, and in about six hours Vanracken was thus floated three miles. Assistance was here procured, and the wounded man taken home as near drowned as bruised to death. Ostrom ought to engrave on his coat of arms, *nil desperandum*.—Nevada Journal.

A SPLENDID OPPORTUNITY.
AGRICULTURAL MACHINERY.

OPPOSITION TO THE MONOPOLY —OF THE— CHARTRES COFFEE.

D. Ghirardelli, who has had for ten years the only STEAM MACHINE for the manufacture of
Chocolate and Coffee!

Announces to the public that he has received by the ship Imperial the best quality of Coffee, called

FAMBURGER,

And that, with the exception of a small quantity in the hands of Messrs. Moore & Folger, he is the only possessor of this fine article.

D. GHIRARDELLI is sure to furnish to the market the best and finest quality of Coffee, which will increase the renown of the well known

D. GHIRARDELLI'S COFFEE!

Besides having arrived by the steamship Golden Age, a French workman, well acquainted with this business and expressly requested, who will begin the preparation of the

CHARTRES COFFEE!

Prepared in the same way as used in the town of Chartres, which has succeeded in gaining a well-deserved name for its superior Coffee.

Attention!—The CHARTRES COFFEE WILL ALWAYS BE SOLD FIVE CENTS A POUND CHEAPER THAN THE D. GHIRARDELLI'S COFFEE.
j66

NOTICE TO SHIPPERS OF OIL AND WHALEBONE.

The Pacific Mail Steamship Company's Steamers will, until further notice, receive Oil and Whalebone at Acapulco, for transportation via Panama, by Panama Railroad, to Aspinwall, and thence by sailing vessels to New York, at the following rates through, viz: Oil, ten cents (10c) per gallon; Whalebone, two and one-quarter cents (2 1/4c) per pound.

FORBES & BARCOCK.

HEYNE MANN, PICK & CO.
311 and 313 California street,
WAREHOUSE OF THE SAN FRANCISCO
PIONEER WOOLEN FACTORY,
Have Constantly on Hand
A FULL ASSORTMENT OF WHITE, BLUE, GREEN AND SCARLET,
2 1/2, 3 and 4 point Blankets.
—ALSO—
Superior All-Wool Family Blankets.
—ALSO—

Sluce Blankets, especially adapted for Quartz Mining. This article has met with general approbation, and Quartz Mills in general will do well to give it a trial.
Having made great improvements in the works of the Factory, including new steam engines, etc., special attention will be paid to the execution of all orders.
Steamers and Hotels can be supplied with Blankets at the shortest notice. Buyers will please examine the California make, the superiority of which over imported Blankets is generally admitted.
All business conducted with the Factory is transacted exclusively at their office—no other party being connected with it.
apl9

HUNT'S IMPROVED FIRST PREMIUM WINDMILLS!

AN ASSORTMENT KEPT CONSTANTLY ON HAND AT THE MANUFACTORY,
Nos. 30 Second street, 208 & 201 Jessie street,
SAN FRANCISCO.

THIS WINDMILL WAS AWARDED THE FIRST PREMIUM AT THE MECHANICS' FAIR OF 1860, in San Francisco, for its great simplicity, strength and durability. It is easily controlled, and will be sold cheaper than any other Mill built. Further particulars in circulars.

The following committee awards the above premium: Devoe, Garratt & Ware; all of this city.
PRICES.—Eight feet wheel, \$50; Ten feet wheel, \$75; Twelve feet wheel \$100 to \$125
apl9
E. O. HUNT, Builder.

UNDERTAKING.—The undersigned would most respectfully inform their friends and the public that they have opened their
COFFIN WAREHOUSES

at 161 Sacramento street, below Kearny, and are ready at all times, night or day, to attend to every call in their line of business. Their stock is very complete, and will enable them to furnish every description of funeral, plain or costly, at the shortest notice.

3d. All persons wishing to make interments in Lone Mountain Cemetery, can do so by applying to us at 161 Sacramento street.

THE FINEST ALE AND PORTER ON HAND.

MODES OF PLACER MINING.*

The Rocker.

The eradle or rocker is, next to the pan, the most simple instrument for washing gold. It resembles, in size and shape, a child's eradle, has similar rockers, and is rocked in a similar manner; whence its name. The eradle box is a wooden trough, about twenty inches wide, and forty long, with sides four inches high. The lower end is left open. On the upper end sits a hopper or riddle, which is a box twenty inches square, with wooden sides four inches high, and a bottom of sheet iron or zinc, pierced with numerous holes, half an inch in diameter. Under the hopper is an apron of wood or cloth, which slopes down to the lower end of the hopper to the upper end of the eradle box. A strip of wood, an inch square, called a riffle bar, is nailed across the bottom of the eradle box, about its middle, and another at its lower end. Under the bottom of the eradle box are nailed two rockers, so that a rocking motion may be given to the machine. Sometimes an iron spike runs down from the center of each rocker, and enters a hole in the bar of wood on which the rockers rest. The purpose of the spike is to keep the rocker from moving sidewise, or slipping downwards. The wooden bars on which the rockers rest, may be connected together by cross piece, so as to form a square frame.

When the rocker is to be used, it is placed in the spot to which the pay dirt, and a constant supply of water can most conveniently be brought. The lower end of the eradle is placed so as to be about two inches lower than the upper end. The miner fills his hopper with pay dirt, sits down by the side of his eradle, pours a dipperful of water on the dirt, and begins to rock, and keeps on pouring water and rocking until nothing remains in the hopper save clean stones. He then rises, lifts up his hopper, throws out the stones, and is ready to repeat the operation. It very rarely happens that he finds pay-dirt, all of which will pass through his riddle. The length of time required for washing a hopper of dirt depends upon the tenacity of the dirt, the supply of water, and the violence of the rocking. If the clay be tough, a quarter of an hour may be spent in washing a hopper; if it contain much sand, two or three minutes will be enough. The water, dissolved clay, sand and gravel and gold, less than half an inch in diameter, fall down through the holes upon the apron, which carries them to the upper end of the eradle box, whence they run down towards the open end. The gold and heavier particles of matter are caught behind the riffle bars; the water, thin mud, and other light materials are carried away over the riffle bars, and are considered worthless.

The rocker requires a large supply of water, which should be supplied by a little brook, with a reservoir large enough to receive the dipper, and near enough to the miner to enable him to reach the water without moving from his seat by his eradle. Both the water and the rocking are necessary to wash with the eradle; both are needed to dissolve the clay, and carry away the light and soluble matter, while retaining the gold. The rocking would do no good without the water, and the water would do little good without the rocking. As almost a constant stream of water pours into the hopper from the dipper, so almost a constant stream pours out at the lower end of the eradle box.

If the gold is very fine the hopper may be pat over the lower end of the eradle, so that the apron may be looser, and much of the gold is then caught on the apron.

The rocker must not be set level, for in that case too much dirt would accumulate above the riffle bars, and would pack or settle down into a hard mass, on a level with the riffle bars, and all the dirt and gold coming down after it had once packed, would run away as over a smooth board. If, on the other hand, the inclination of the rocker be too steep, the current of water is too strong and carries away the gold with the dirt.

Packing is a serious difficulty in the way of all or nearly all processes of gold washing. The dirt will pack in cradles or sluices; and when it is once packed, there is little obstacle to the escape of the precious metal. Many devices have been used to prevent packing; but I never knew one to succeed. Sometimes the bottom of the eradle is made of sheet iron, and of a concave shape, being two inches deeper in the middle than at the sides; but the dirt packs in these cradles nearly as badly as in the others. If I had need of a rocker now, I think I should try one with a convex sheet iron bottom, with the convex side up, with a riffle bar considerably higher at the sides than in the middle. Quicksilver has been used in cradles to prevent packing and to catch the fine gold; but in most cases some of the amalgam is lost, carrying away gold that would otherwise be saved, and it does not prevent packing. The more constant the rocking of the eradle the less danger of packing. A device to prevent packing is to put a little block under the rockers at each end, so that every time they come down the eradle gets a jolt, shaking up the gravel at the bottom and letting the water get under it, and thus preventing its settling. A rocker always furnishes work for at least two men, and the dirt does not pack so badly when two are at work as when there is only one; for in the latter case, after washing a hopper he must always move from his seat, take up his shovel and fill his hopper, and then go back; whereas, if there are two, the shoveler can fill the hopper as soon as the cradler has emptied it. The cradler has a large iron spoon, with which he occasionally scrapes over and loosens the dirt that has lodged above the riffle bars,

and several times in the course of the day he cleans up, by taking out the dirt into his pan and panning it out. The upper riffle bar always catches much more gold than the lower one; and sometimes cradles are made two feet long with a single riffle bar. These are made only when they are to be frequently moved.

The eradle should be placed, if possible, so near the claim that the pay-dirt may be shoveled directly into the hopper; but a greater weight of water is required than of dirt, and if water cannot be brought to the claim the dirt must be taken to the water. The mode of carrying the dirt depends upon the distance and the nature of the road. If the distance be small, men carry the dirt in buckets, or wheel it in wheel barrows; if great, pack mules, carts or wagons are used. When the water can be brought to the claim, two men are usually enough, in shallow diggings, for one rocker. But if six or eight feet or more of barren dirt is to be stripped off, before reaching the pay-dirt, three or four more may be required. Sometimes a laborer is occupied with hauling water out of the claim, and attending to the tailings, as the gravel and sand that seeps at the lower end of the rocker are called. These tailings are deposited by the water, after leaving the rocker, and soon accumulate in a formidable amount, if not carried away by a swift descent.

A miner alone should wash in ordinary shallow diggings, some seventy five to one hundred and fifty pans of dirt a day in a cradle; and two twice as many. A pan is an indefinite amount, varying from half a peck to a peck; perhaps, usually about half a cubic foot of dirt. Frequently the shoveler has a pan or a bucket, which he fills with his shovel, and when the cradler is ready for him, he picks up the pan and empties it into the hopper.

In some pay-dirt the clay is so tough that more than an hour would be required to completely dissolve a hopperful of it. Sometimes the cradler undertakes to mash up the lumps with his hands; sometimes he rocks his cradle and pours his water for five or ten minutes or so at a hopperful, and throws out all the lumps undissolved at the end of that time, intending to wash them over again after they shall have been softened by exposure to the weather. Sometimes the dirt is dug up and exposed to the weather before it is washed.

The Pudding Box.

Another device for dissolving tough auriferous clay, is the pudding box. This is a rough wooden box, a foot deep and five feet square. The clay is thrown in with water, and worked about with a hoe until dissolved, when a peg is taken out of an anger hole about four inches from the bottom, and the thin mud or slum runs out, leaving the heavy material at the bottom. The work continues in this way all day, and at night the contents of the box are taken out and washed with a eradle or pan.

The Long Tom.

The tom or long tom is a wooden trough, from eight to fourteen feet long, eight inches deep, usually about sixteen inches wide at the upper, and thirty inches wide at the lower end. The bottom at the lower end is made of riddled or perforated sheet of iron, and under the riddle is placed a riffle box, or small trough with several riffle bars. A constant stream of water runs through the tom, entering at the upper end where the dirt is thrown in. The riddle has an upward turn at its lower end so that nothing can run over there. The large stones are thrown out with a shovel, and the small ones escape with the sand and gravel through the riddle. The gold is all caught in the riffle box, where the dirt is kept loose by the water falling from above. Sometimes quicksilver is put into the riffle box to catch the fine gold. From three to six men may work with a tom. The tom is better suited for level ground than the sluice, which requires a considerable descent for the water. The tom is very seldom seen now in California.

CALIFORNIA WINE.

CARD.

LAKE VINEYARD, Los Angeles county, Cal., }
March 21, 1861. }

BEING OFTEN APPLIED TO BY ACQUAINTANCES THROUGHOUT THE State for my Wine in small quantities, I hereby notify them, as well as the public generally, THAT I HAVE APPOINTED

Messrs. Hobbs, Gilmore & Co., of San Francisco,
MY SOLE AND EXCLUSIVE AGENTS

For the State of California, for the sale of all the different classes of Wine manufactured by me at Lake Vineyard (and that they can not be obtained of any other parties) giving the assurance that they will obtain from them the same article in every respect as I have in my cellars. B. D. WILSON.

NOTICE.

In conformity with the above card, the public are informed that we, the subscribers, have for sale, at our

WINE CELLARS,

Southeast corner Market and Beale Streets.

Nearly opposite the Railroad Depot,

PURE WINES,

CONSISTING OF

Port, Angelica and White Wine

All warranted to be the pure juice of the grape.

Which we will sell in quantities to suit purchasers, put up in shipping packages, or otherwise.
HOBBS, GILMORE & CO.,
Market street, opposite the Railroad Depot.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved

AMALGAMATORS.

For Gold or Silver Ore, which are claimed to possess the following advantages over all others now in use, viz.

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The pans most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First Street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,
J. B. BEERS
165 Clay street,

WE ARE NOW PREPARED TO RECEIVE GUESTS

-AT OUR-

NEW SALOON,

327 Montgomery street, TUCKER'S BUILDING,

-FOR-

BREAKFAST, LUNCH, AND SUPPERS,

Where will also be kept on hand every variety of CONFECTIONERY, JELLIES, ICES, PASTRY, CAKES and BREAD. Our Manufactory is on the premises, where we make every article sold from our counter. We are prepared to furnish Balls, Weddings, Reception Parties, or Families, with every article desired, in small or large quantities. All will find it to their advantage to examine our goods, as they will find them manufactured from the very best material, and with utmost care, and sold at reasonable prices. The Manufacturing Department is under my own immediate supervision, and having had over twenty years experience in our business, we feel much confidence that we shall please the public. All goods sent free of charge.

THE GREAT WORLD'S FAIR OF 1862.

The official programme of the Great World's Fair of 1862, has just been published in the London *Gazette*, from which we learn that it will open on Thursday, May 1st, 1862, and close October 10th. All works of industry produced since 1850 will be received, and all persons, whether foreigners, inventors, manufacturers or producers of articles, will be allowed to exhibit. Her Majesty's Commissioners will only communicate with foreign exhibitors through the *commission of each government*, which may be appointed for that purpose; and no article will be admitted from any foreign country without the sanction of such commission. No rent will be charged to exhibitors. Prizes or rewards for merit, in the form of medals, will be given in the industrial part of the exhibition. Prices may be affixed to the articles exhibited.

Articles will be received on and after the 12th of February, until March 31st, 1862, inclusive. Exhibitors will be required to deliver their articles at the building, and to unpack and arrange them at their own charge and risk; and all articles must be delivered with the freight, carriage, portage, and all charges upon them paid. Packing cases must be removed at the cost of the exhibitor, or his agent, as soon as the goods are examined and deposited in charge of the commissioners. Exhibitors will be permitted, subject to general regulations, to erect according to their own taste, all the counters, stands, glass frames, brackets, awnings, hangings, or similar contrivances, which they may consider best calculated for the display of their goods. They must be at the charge of insuring their own goods. The Commissioners will not be responsible for any losses or damages of any kind by fire or theft, or in any other manner, but will take every precaution to prevent the same, and will give all aid in their power to bring to justice any persons guilty of robbery or wilful injury in the exhibition. Exhibitors may employ assistants to keep in order the articles they exhibit, or to explain them to visitors, after obtaining written permission from Commissioners. Shafting, steam and water will be provided for machines in motion. Form of demand for space will be furnished by the Commission of foreign governments when appointed. The articles for exhibition will be divided into four sections, which we shall publish next week. The Exhibition building will cover an area of twenty five acres; that of 1851 occupied about eighteen.

We trust that the industry of California will be well represented. In wines, agricultural and mineral productions, woolen and other manufactures, jewelry, and some of the fine arts, we see no reason why we should be behindhand in excellence, and we would urge our citizens engaged in those branches of toil to send samples to England in good season for this Exhibition, which promises to be far superior in every way to that of 1851. We presume the next Legislature will appoint a Commissioner on the part of this State to communicate with H. B. Majesty's commissioners, as per programme; or authorize the then Governor to do so. This should be done in the earliest part of the session. Doubtless the commission on the part of the United States Government will consist of one Commissioner from each State, appointed in this manner. We shall refer to the subject again.

MESSRS. HUTCHINGS & ROSENFELD, have laid upon our table a beautiful lithograph of Col. Ellsworth, a map of this city, Eastern papers, and a copy of their "Scenes in California," for all of which we express our sincere thanks. They are enterprising publishers, and are deserving of the liberal patronage they seem to enjoy. At their Depot, may be found the latest novels, pictorials, periodicals, or other works of art, at moderate prices. Their place is most eligibly situated on Montgomery street near Clay.

On Dr. — The illustration of the Willows that appeared in our last issue, will soon be represented on a large scale, as a portion of the scenery in "The Seven Sisters," at Magnific's.

(From our Special Correspondent.)

LETTER FROM CARSON VALLEY.

MOUNTAIN ROADS.

CARSON VALLEY, May 27th 1861.

EN. MINING AND SCIENTIFIC PRESS.—As there promises to be a heavy travel between California and this point the coming summer, it may interest many on your side to know something of the roads leading over the mountains. Of these there are now several, passing over the Sierra at various points, though the road most in use at present, is that *via*, Placerville, Strawberry and Lake Valley, now for the most part in excellent condition. For four or five miles on the top of the west summit there are some bad places, the melting snow keeping the track muddy; elsewhere it is dry, and even dusty. The reason this route is preferred is, that in coming from San Francisco and the central portions of the State, it is a little the shortest, and so far the best, more work having been done upon it than on any other. The natural facilities, however, for constructing a wagon road over the mountains, are greater at several other points, and it will not be long until much of the travel destined for Virginia City, Chinatown and the Humboldt district, will find its way through the Hennessy and other passes in that direction. Already the entire immigration from Northern California comes in that way, and when the improvements now in progress shall be completed, a good share of the business now done through Placerville, will be diverted into those northern channels.

It is surprising, the amount of money and work that has thus far been expended on those several mountain roads; their aggregate cost being not less than \$250,000. Owing to injudicious selection of routes, and in some cases a bad location of the tract, a great deal of this money has been little better than thrown away. This is especially true of the Placerville road, the line of which was determined by the Surveyor General of California, under an act of the Legislature, in 1854, appropriating a large sum for its location and construction. The appropriation, however, being declared unconstitutional by the Supreme Court, the measure was abandoned by the State. The countess of Sacramento and El Dorado, thereupon took it up and carried it through, the same line adopted by the Surveyor General being universally adhered to. The piece of road thus built embraces the section between the crossing of the American River, twenty miles east of Placerville, and Strawberry Valley, a distance of about thirty miles, including the bridge over the stream. It cost over \$30,000, raised chiefly by a tax on those counties, and was designed to be a free road. For the past year, however, tolls have been collected upon it, ostensibly for the purpose of keeping it in repair, though very little money seems to have been laid out for that end. The grand mistake made in the early stages of this enterprise, consisted in carrying the road over the river, and locating it high against the bank on the north side, whereby it received the entire wash of the mountain above, and was subjected to the further disadvantage of an undulating grade, and material increase of distance. Owing to the first cause in connection with a neglect to provide proper means for drainage, it is for five months in the year nearly impassable; convinced of this mistake, a company last summer laid out a new track, on the south side of the river, by which a saving of eight miles, and a vastly superior grade is secured. This track leaves the old one about three miles west of Brockliss Bridge, and running almost straight slopes with a uniform grade gently down to the river crossing it on a substantial bridge about fifteen miles below Strawberry Valley, where it rejoins the old road. It is now open to pack trains, and will soon be ready for the passage of wagons, when it will be likely to wholly supersede the other.

From Strawberry we pass to the top of the west summit, over Swan's Toll Road, built last summer. Not satisfied with the present location he is now shifting it, with a view to securing an easier grade up the mountain. A large force of hands are at work and the new road will shortly be completed, furnishing the public an excellent highway over this, the most difficult spot on the mountains.

Between the east end of Swan's and the beginning of Kingsbury's road, is the few miles of bad road mentioned, and on which but little work has been done. It is to be improved this summer. From this spot Kingsbury's road extends to Carson Valley, leading down the east side of the West Summit, crossing Lake Valley and passing over the East Summit, a distance of 22 miles. It is one of the most magnificent roads in the State, and excites the admiration of every observant person travelling over it, by its grand proportions, its massive walls, and generally substantial appearance; having more the air of some great public work than of one undertaken and carried to completion by private enterprise alone.

Some idea of its magnitude and of the skillful engineering required in locating it may be gained from the fact that it overcomes, by an even grade and an almost imperceptible rise, an ascent of near 3,000 feet in going a little more than two miles by a straight line. This is effected by carrying the road up the mountain in a zig-zag course, whereby the distance is increased to 5½ miles. The road bed, most of the way, occupies a deep excavation, its lower side supported by a massive retaining wall of granite, in many places from ten to twenty feet high. The roadway is to be 17 feet wide,

when completed, allowing wagons to pass everywhere without difficulty. Bands of men are constantly engaged widening and blasting the track—that is, filling in low places reducing inequalities, and rendering it perfectly smooth and level. At the points where it makes its curves are extensive platforms, nearly level, and sufficiently large to allow an eight mule team to turn without slacking their traces. At the outer curves these platforms stand out like stupendous bastions against the sides of the mountain, affording the finest possible views of Carson Valley with its sage plains and meadows, its meandering streams, traceable by their willow-fringed banks in all their wanderings through the green fields below. But awfully grand is the scene when the mists hang over, or the storm stalks across the valley, enabling the spectator to look down on their billowy commotion as they curl and eddy, or, gilded by the sun, sweep like pillars of fire athwart the black gulf at his feet.

The entire cost of this improvement will be \$60,000. A single bridge upon it cost over \$2,000. This structure is 161 feet long, and 50 feet high, with an 11 feet foundation wall under the piers. This road was commenced in the depths of the terrible winter of '59, and notwithstanding the scarcity of labor, the high prices of provisions and the stormy weather that held on quite into summer, was finished within six months from the time it was entered upon by its most competent and energetic proprietor. Few other men than Kingsbury could have effected as much in the same time. Indeed, there are few men possessing in such an eminent degree, those elements of character requisite to the successful prosecution of an enterprise surrounded by great material difficulties and discouragements. With long experience in road and bridge building, he combines a thorough knowledge of the science of architecture and civil engineering; whereby he is enabled to design all his works as well as superintend their execution. Add to this, he is a man of bold ideas, great powers of physical endurance, and unrelenting purpose. Little do the community reflect how much they are indebted to such men. Here we have a project, which for years appalled the capitalist and even baffled the ken of legislative wisdom, seized upon by one brave and determined man and rapidly pushed to completion in less time than these timid and inefficient men would have taken to secure the services of an engineer. The high bugbear of the snowy mountains, long regarded as an insurmountable barrier to a wagon road into the great Interior Basin, and used with such good effect by Southern interests to frighten us out of our purpose to build a Central Railroad over the Continent, sinks into an ant hill before the well directed efforts of one man, encouraged by the growing wants of a new industry, sustained by confidence in his own powers. Limited as I know your space to be, I could not, after passing over and carefully surveying this splendid specimen of highway architecture, refrain from paying a slight tribute to the merits of the man first to construct a practicable wagon road over the rugged Sierra.

Correspondence from the Mount Diablo Coal Field.

KIRKUS PASS, NEAR MT. DIABLO, June 18, 1861.

EDITOR SCIENTIFIC PRESS:—Since my last communication, little has transpired in this quarter, which would interest your readers. Still, the last few days are not, even in this isolated section, without their events. The "debut" of daily visitors to this county is evidence of the deep interest felt throughout the State in reference to the extent of the Mount Diablo Coal Mines. Mined men, editors, newspaper reporters, mechanics, artisans, miners, all have their representation, and are interested in the great revolution which the discovery of these mines is destined to accomplish. Every day brings with it an increase of production from those already open, while new discoveries are events which now create but little surprise; in fact this section of country for miles, abound in rich deposits, and although some parts of it may be too far from water transportation, yet the day is not far distant when even this portion will be turned to good account.

From present indications these mines will produce more coal yearly, than has hitherto been consumed in the State; yet, notwithstanding this fact it must be evident to all that a decrease in price of the article must create a corresponding demand. There is, then, nothing to be feared in this direction, by those interested, for although they may not be able to realize such large profits, yet a steady demand with fair remuneration, will ultimately yield good interest on money invested. The building of the Railroad from these mines will materially reduce the price of transportation. The Cumberland is now paying \$2 50 per ton, so I am informed, to get their coal to Suisun Bay, or where it can be shipped to market. This is not only an expensive mode of transportation, but it is one which is altogether too tardy for the mining interest. It is estimated that the transportation upon the projected Railroad will not exceed \$1 25 per ton. If the calculation be a correct one, and I have no doubt on that score, it will naturally be seen that, not only the interest of the mining population, but also that of the State at large, require the speedy construction of this road. Neither is there any question as to the remunerative ability of the road. It will undoubtedly be the best paying property in the State.

But as my communication is assuming a somewhat lengthy tendency, I will close for this time.

Yours, truly,

L.

SUMMARY OF MINING NEWS.

CALIFORNIA.

Nevada County.—The San Juan Press says that the heretofore pros-
perous little mining town of Cherokee appears to be rapidly on the decline.
principal hotel and several of the principal saloons have been closed, for
want of customers, and quite a large proportion of the population have gone
to Washoe and other places to seek in a few days of prosperity. The mines
in this locality, with the exception of a few, are poorer and less productive
than the "Last Hope," shaft which is now being dug down, should reveal the
existence of large quantities of gold resting upon the bed rock, the town will become
richly deserved. Many of the best citizens, however, feel sanguine
that rich discoveries will be not far in the future, which will secure this
area larger business and population than it has ever had before. . . .
There are within the vicinity of North San Juan, according to the same au-
thority, several gravel ranges, admitted by every miner of experience, to
contain rich deposits of gold, but which have not yet been fully explored.
It is to be accomplished within the next month, many more will be en-
gaged—more capital than our people can combine—is required to pierce
the suitable shafts and tunnels into the bowels of the hills in order to un-
earth their hidden treasure. . . . The clean up of the Eureka company, last
week, after an eight day's run, was \$12,000. . . . A correspondent at North
Oroville says: There is considerable mining being done here and there,
around about, and after the completion of the Hamilton Flume, which is
likely to be accomplished within the next month, many more will be en-
gaged to prosecute their mining operations. . . . Dr. Hilder is playing for
big, each having a fall or pressure of 150 feet perpendicular, and with
rich seams seems to be purging the very bowels out of the Terrestrial globe. . . .
The Nevada Transcript has received from a miner in that county, a pack-
age of specimens of pure virgin copper, taken from the clowns of Ilwaco,
wis & Co. Buckeye Hill, Sweetland. The miner sending it says he has
found on state bell rock a little green color, that indicates a gravel de-
posit of 70 feet in depth. The ledge of ore from which the copper is taken
lies from ten to 50 feet in width, and may prove to be one of the richest
in the coast. Some of this copper has assayed (in gold) as much as
25 per ounce. This ledge can be traced on the surface for miles.

Tuolumne County.—The immense richness and extent of the Placer
quartz and Quartz Leads in this county, says the Columbia Times, are too
well known to need comment, but the extent, value and importance of
the heretofore mineral deposits are only commensurate to be generally
known. There is scarcely a mineral known to commerce or science but which
can be found in "old Tuolumne," and the resources of the more com-
mon, but important from the discoveries of leads, veins, and "indications"
of the ores of copper, are becoming so numerous that we have given up all
idea of keeping a record of them. And although the majority of such dis-
coveries may not be of any present absolute value to those who make them,
they are not far distant when the tall chimney of the blast furnace will
send a striking feature of the landscape in these mountain districts—when
the great metal will be found in the hills of the county, and the place where
it is found, will yield large profits when spent in the place where they are
needed. The operations of the Columbia Prospecting Association have re-
sulted in the discovery of many valuable minerals. We saw a very fine spec-
imen of the red oxide of copper, found by the agent of this association in
the neighboring mountains, which upon assaying was found to yield sixty
per cent of the metallic copper! We have at our office many fine specimens
of various ores of copper and other minerals found in this district, which we
would be pleased to exchange for those from other parts of the State.

Solano County.—The Express remarks that experiments have proved
that the cement found in the hills of Benicia is superior to the best for-
eign imported. First one company, and now a second company for work-
ing the cement deposits are in operation. There is an extensive stratum of
the blue clay under the old hills of Benicia, which we conjecture must have
old in the neighborhood.

Del Norte County.—The Crescent City Herald in its last issue says:
Notwithstanding the immense returns the people of Calaveras effect from
their copper leads, none of them have been ascertained as yet to yield more
than forty-eight dollars worth of pure metal to the ton, while the highest es-
timate we saw made is for a yield of one hundred and twenty dollars to the
ton. If that, a yield like that, is going to be so remunerative, what better
investment could be made by capitalists in San Francisco or elsewhere than
in the leads in this county, now proved to be richer than the estimate of the
others? Develop the mineral wealth of Del Norte, and she will be one of
the richest counties in the State. That development will take place sooner
or later, but we would like much to see it commenced this summer.

Amador County.—The Amador Ledger, at the conclusion of an article
on the Calaveras copper discoveries, says: Since writing the above we
understand that a copper vein has been discovered near Lancha Plana, in
this county, which is in all probability a continuation of the same vein
found in Calaveras county. . . . The bi-patch, in alluding to this latter dis-
covery, says that specimens of ore have been found all the way between Cam-
poco and Deason's store. . . . The many quartz mills of Sutter Creek and
immediate vicinity never yielded better or more regularly than now. . . .
But little mining is being now done in the immediate vicinity of Jackson. On
Mount and French Hills there are several claims that continue paying good
wages. In the quartz mining, the bi-patch learns that the different
mines are getting their usual yield, but the auriferous sand on Murphy's Gulch
and Spanish Gulch continue to pay well. Last week, Eyrebeck & Co. took
out thirty-five ounces. Moore's Mill on Hunt's gulch, has suspended opera-
tions, but it is the opinion of those who are familiar with the ledge, that it
will pay well, with proper management.

Yreka County.—In the Yreka Journal we find the following mining
news: From almost every part of our county we hear the most flattering
and encouraging news, while we still continue to receive the most substantial
proofs of our increasing prosperity, in the shape of large quantities of gold
dust which are daily being purchased by our citizens, and the fact that the
trade in the Humboldt Creek, we have found the mines are yielding re-
markably well—better, in fact, than had been anticipated by the most au-
gustine miners. The claim of W. A. Rider, week before last, paid a little over
five hundred dollars, and last week it exceeded the week previous. . . . We
have reliable information that on Soda Creek, although without fabulously
rich has yet been struck, there are about 25 or 30 miners, who are getting
first rate prospects.

Lake County.—We have heretofore refrained, says the Napa Reporter
of the 16th, from saying much concerning the late discoveries of Clinnabar in
this (now Lake) county, having been under the impression that the Excelsior
Company, between Berryessa Valley and Clear Lake, and having, moreover,
a direct and positive knowledge of the results of a month's prospecting, we
are now prepared to speak definitely. From our actual knowledge, we
are prepared to say that in all probability no discovery of clinnabar in America
has ever been made equal in value or extent. Two well defined ledges of
the mineral extend up the mountain side, visible from the surface at most
points for over three thousand feet. They are broken in places, but still ap-
pear to be forming continuous and massive ledges. Between these ledges
exactly a loose stone can be turned up by the pick, but which, on breaking,
proves to be clinnabar of the richest quality. Many immense stones, stand-
ing isolated, are nothing less than solid blocks of clinnabar. For a distance
of over a hundred yards at the foot of the mountains, and far up its side, the
pick stuck into the common soil, comes out reddened with vermilion. A
pin of earth taken from the surface, will give a heavy percentage of ver-
million. Among the many gentlemen of experience in such matters who have vis-
ited the place within the last few weeks, we have heard none express a doubt
either as to the richness or extent of this discovery. The more massive por-
tions of the ore are of a liver color, occasionally traversed by seams or veins
which are nearly black. Other portions are of a brilliant red hue, with a
bright crystalline fracture. No sample has yet been tested yielding less than
sixty per cent, and some even as high as eighty.

San Francisco County.—Some Mexicans, says the Colima Times, of the
18th, have discovered a quartz lead about a mile above town, which pros-
pects very rich. This lead has long been looked for on the South side of the
river, but till now has not been struck. . . . The same paper says: We un-
derstand that the claims of Messrs. Johnson & Montgomery, on the hill south
of town, at the last clean up, averaged eleven dollars and fifty cents per day
to the hand. We also understand that they have some claims which will
pay even better than that they are now working. . . . The Central Californian

informs that a few days ago the workmen of the Wisconsin tunnel, at Smith's
Flat, near Placerville, obtained a sum between sixteen and eighteen hundred
dollars from one hundred and eighty car loads of dirt.

Plumas County.—A correspondent of the Appeal, writes from the
East Branch of the Feather river, thus: There is considerable mining going
on at the Junction—several companies making from \$8 to \$12 per day to the
hand. A large wing dam is being put in by a French company, and I learn
several claims will also be built on the North Fork. Plumas county is not
half prospected, and I consider we have as good mines as any in the State.
All the country is richly capable to make it one of the first mining counties
in the State. There are numerous quartz leads which prospect well, and no
doubt they would be paying investments if rightly worked.

Tulare County.—We hardly know where to place the Cose district,
whether in Tulare county or Nevada Territory, but think that it is in the
former. From the Visalia letter we learn that the Panamint Mining Co. have
been their articles of incorporation. The capital stock is \$270,000 in 2,700
shares at \$100 each. The silver ledge upon which they design operating was
the Marble fault lying west of South Valley and between that locality and
Cose. The Panamint range of mountains, take their name from a ridge of In-
dian living there. . . . Mr. Hiteche, of the Cose Mining Co. has shown us
some rich specimens from a quartz vein recently discovered at Cose. The
gold is very fine; generally diffused through the rock. A quantity of it will
be shortly sent to San Francisco for assay. . . . Several old residents of Vi-
salia have arrived there from the Cose and Washington Mining Districts. In
common with others who have recently arrived from the silver mines they seem
to have great confidence in the ultimate success of their operations.

Mono County.—The Bulletin's correspondent writes from Aurora as
follows: For rich surface rock, the like of this region has, perhaps, never
been met with and yet it is too soon to claim that the business of mining
here is bound to be pre-eminently successful. Ledges, there are in abun-
dantly—abundantly, too, do they show both gold and silver in their outcrop-
ings. It is wonderful, the amount of these metals to be seen by the naked
eye, in walking over the ground. Hence the good opinion of these mines cu-
rrently held by nearly every one who has visited them. Yet we all know, that
however strong the presumption these appearances create in favor of their
richness, they do not prove them to be so. And it is this fact that deter-
mines the cautiousness of the business men here, (as they did in Washoe), and
business men from erecting mills, and plunging recklessly into quartz crush-
ing, as had heretofore been the case in California. The ledges must now be
opened, and their character to some extent determined before anything can
be said with them, or much be said about them one way or the other. Sat-
isfied of this, the miners have at last gone to work with a will, and there is
not a more busy camp to-day in the State than this. Over 100 different
ledges are now being prospected, some by means of gold and silver
and shafts, while in other cases nothing more is done than to strip the ledge
that is, throw off the earth that covers it, in order to ascertain its size and
length, and trace its direction. In some cases, this latter process determines
the supposed ledge to be only a spur or boulder, while in a majority of in-
stances it reveals a good-sized and often a large and well-defined ledge. In
this district there are over 200 tunnels, in every stage of progress, some of
them being but a few feet deep, while others have been driven for miles
into the earth, and in some cases, where the ledge is hard, requiring much blas-
ting; hence the work moves slowly. Of shafts begun there are a great num-
ber. Few of them, however, have been carried down sufficiently far to de-
termine the character of the ledge. In nearly every case where this has been
done, the results have been favorable—either a ledge of ore being struck or
signs of its existence met with. In some instances nothing is found to reward
the labors of the prospector, yet it is but just to say that in a fair proportion
of cases the excavations reveal valuable leads of gold and silver be-
hind rock. Ledges thus tested and found to be good, come at once to possess
a value commensurate with the prospects obtained. Hence there is a class
of ground here that will always sell currently at certain prices, its value
being pretty well ascertained and fixed; for example, interests in the Clay
Angeles and Silver Hill ledges sell almost as readily as double-eagles, at \$20
a foot. Of course, it is not every man who wishes to buy, or having it, cares
to sell at that figure; yet it is to be said that the value of the ledge is
fixed. So the ledge in the Esmeralda Discovery Company, which used
not be parted with for less than \$50 a foot—\$75 is the current rate. The same
may be said as to the positive and uniform value of other ledges here; yet
the whole of these is so small, compared with the entire number of ledges lo-
cated, that it may justly be said almost nothing is yet known of these mines
encouraged by the fact that a few paying ledges, at least, as well as an im-
mense amount of ground, are found to exist in the various parts of the
county, erecting mills and smelting establishments for working the same, one
quartz mill being already up and nearly completed. . . . The Aurora corre-
spondent of the Napa Reporter also furnishes us some interesting items: The
town of Aurora is about 8,000 feet above the level of the sea. We have
mountains here that can back out Mt. St. Helena, even with Mt. Diablo placed
on top. Our camp now boasts of about 1,000 males and twelve females,
with unmistakable evidence of a large emigration this summer. Our pros-
pects are all positive of the undeveloped mineral wealth of the country.
The miners are busily engaged in opening their claims, and every day brings
forth evidences of the richness of our Silver leads. The question is asked,
why if your mines are so rich, do you not show some of the results of their
richness. If you will give us time we will do so; but a moment cannot de-
velop anything.

Calaveras County.—The Calaveras Chronicle says: We learn from
gentlemen who have prospected the copper claims in the vicinity of Campo
Seco, that the ore assays fairly well; the lead has been traced from Copperopolis
to the Mokelumne river. We do not suppose that the entire lead will pay,
but that good claims will be found through its whole length, is not doubted
by many scientific men from Stockton and San Francisco. The mineral
wealth of this county bids fair to rank Calaveras among the richest in the
State. As the placer gold diggings become exhausted, rich deposits of the
precious dust are discovered in the mountains, by means of the tunnels,
which are now penetrating our hills in this neighborhood, and the deep
shafts which are being sunk in the hills are daily developing mineral re-
sources which, for years, have lain hidden from the search of the miner.
The copper claims pay splendidly, often as high as \$100 per day to the man.
The demand for copper is far greater than the supply, and it every foot of
the copper leads of this county should pay for working, there is no danger of
the market being overstocked. Men of wealth and intelligence from the cities of
this State are freely investing in copper claims; and the owners of old claims
are flocking to the copper region, as towns are springing up on the lead,
and camps which were nearly depopulated, are resuming their old business ap-
pearance. We sincerely hope that the most sanguine expectations of the
miners will be realized and that the copper deposits of our country will
prove an inexhaustible source of wealth.

Sonoma County.—The Santa Rosa Democrat says that the develop-
ment of the rich mines of quicksilver in Sonoma county promises much for
the promotion of business interests generally in that quarter. The citizens
there are becoming awake to the fact. A movement has been made in view
for the object the improvement of the roads leading to the mines, and it is
proposed to have the same recognized as public roads, and that money be raised
for their improvement and subscription, to help and keep them in good order.
Hardsburg has already guaranteed \$600. It is considered that the mines
will attract population, capital will find legitimate employment, and the
country interests, wealth and importance will increase in due proportion. If
the roads, however, are allowed to remain impassable, the wealth to be de-
rived from the mines will be diverted from the channel that many of the ci-
tizens feel to be legitimate.

Sierra County.—Some of the claims at Secret Diggings, says the La
Porte Messenger of the 16th, are paying an extraordinary well this season. We
saw there half a ton of rich dust in Everts, Wilson & Co's office, last
Saturday, the result of four days work by the Utah company. There were
three hundred ounces and eleven pennyweights, amounting to five thousand
three hundred and forty-nine dollars and eighty-eight cents—over two hun-
dred dollars a day to the hand. . . . The French company, in fifteen days,
took out one hundred and seventy-eight ounces, six pennyweights—\$2,247.66.
The claims are hydraulic diggings in a dry camp, and the men are mostly all
mining, and the company is not yet good. One member had refused \$2,000
for his one-third interest. They have found rich prospects at the bottom of
the incline; coarse gold, and from 50 cents up to \$12; which indicates that

they are near the main channel. . . . The Live Yankee com-
pany is also putting down an incline for the same lead—ex-
pecting to go some 60 feet before reaching it. . . . The Em-
pire, Uncontaminated, and Mint tunnel companies, are still
drifting through bed-rock towards the lead. . . . At Minne-
sota, the Hell-roaring company is still doing well, and also
the Pennsylvania—the latter taking out from \$8 to \$10 per
day to the share. Their ground joins the Centerville claims.
. . . At Centerville, the Downville and Schuykill claims
are giving out richly to the owners. Two years ago, the
place was almost deserted; and claims could be got for about
nothing; but a neglected tunnel caved, and disclosed rich
gravel; and now each company has resumed work, and there
is not a more active mining camp of its size in the mountains.

Alameda County.—In referring to the Pacific Coal Min-
ing company's claim, at Corral Hollow, in the southeastern
portion of Alameda county, the Alameda Herald says: The
mine was discovered in 1856 by Mr. O'Brien, but never was
opened so as to develop its value and richness until about a
year ago, when several extensive leads were struck and pre-
parations were at once made to work them. Four tunnels
have been dug an aggregate extent of over 2,600 feet, and
the proprietors find good encouragement for them to pursue
their labors. They are now working about 60 hands and
are prepared to ship 1,000 tons per day to San Francisco.
Buildings and improvements have been made at the mines
at a cost of over \$50,000, and further outlays are in contem-
plation. A railroad is soon to be built from the mine to the
San Joaquin river, a distance of 14 miles, when the expense
of delivering it in San Francisco will be materially lessened.
The Company feel confident that they will be able to supply
the entire demands of that market when they have fully
opened their mines. The Company is organized with 1,100
shares of \$500 each, which are now worth about 50 per cent.
These works will prove a valuable acquisition to the property
interest of Alameda county, and will eventually hasten the
construction of the Oakland and Stockton Railroad which
has long been contemplated, and which will pass directly by
the mines. The present cost of delivering the coal in San
Francisco is \$6, and it is selling for \$15. The Company
can supply all demands on the Pacific in a few days at \$10
or \$12.

NEVADA TERRITORY.

Washoe District.—From the Enterprise we glean the fol-
lowing news: Some idea of the valuation placed on some of
the claims at Gold Hill, may be judged by the fact that last
week \$3,000 per foot was offered for a portion of ground at
that place, and refused. . . . The Olney Company at Gold Hill
have struck the lead in their claim. Its width and richness
are not yet determined, but it is supposed to be a very valu-
able claim. Bacon & Co., who own the claim adjoining, have
penetrated 51 feet into their ledge, and are not yet through it.
They find excellent pay rock the entire distance. . . .
The Central mill is now doing finely—they, on an average,
shipping 600 ounces daily. The bars are remarkably pure,
averaging about 950 fine of silver. During the past three
weeks they have been obtaining ore from a yellow stratum
which yields over \$300 per ton. . . . There are seven mills
either contracted for or in process of construction, between
Virginia and the Flowery District. The volume of water in
the canon is every day increasing, and no ferns are now en-
tertained of a scarcity. . . . The Folsom Telegraph saw last
Saturday eleven large bars of pure silver, the property of
Messrs. Herold & Hamill, valued at \$27,000. Mr. H. in-
forms us that it was taken out of the claim at Gold Hill,
where there is plenty more of the same sort. He thinks
more silver will be produced from those mines this summer
than the people of California dreamed of. . . . Some one
writes from Gold Hill to the Placer Courier, that the mines
are open here and paying well; they find them much richer
as they go down to the lodes. There are a great many
men at work here now. There is a great deal of money
taken out daily. Times are improving here all the time; but
I think Californians ought not to be in any great hurry rush-
ing into this country for another year, unless they have some
means to prospect with, as money is scarce here among the
many. . . . The Enterprise says: Probably one of the great-
est drawbacks to Washoe at the present time, is the failure
of parties interested in claims to pay their assessments. The
development of some of the best claims in the country is re-
tarded on that account. There are a number of men in our
community, who beg and implor parties to put their names
down in locating claims, and yet never intend to pay a dol-
lar towards their development. The balance of the com-
pany may prospect the claim, expending their time and
means; and if nothing is found, our gentleman, who was
admitted into the company through clarity or friendship,
informs the community, accompanying his remarks with
looks profound, that he never had any confidence in the
claim—that he was satisfied from the appearance of the rock,
etc., there was nothing in it. If, on the other hand, the
claim is found to be rich, he claims his full share. The
other members of the company may inform him that he has
repeatedly refused to pay assessments, but he answers that
his name was on the original location—that he has never
signed any by-laws or articles of incorporation, and that he
knows what his rights are, and is bound to have them. The
only way the company can get rid of such a mean, bunning
sneak, is to buy his interest, or else suspend work and, to
use a sporting phrase, "freeze him out." Either mode of
proceeding is an imposition upon the balance of the com-
pany, and should not be upheld.

Prices of Labor in San Francisco.

The following valuable compilation, which will be read with interest by the readers of the MINING AND SCIENTIFIC PRESS, in the Eastern States, as well as in our own, we extract from the *Alta*. Says that paper: the tables exhibited show the present prices of labor in this city of the various classes most in demand. Where mechanics are mentioned, it is understood, of course, that they are journeymen, and the prices set down are those usually paid to such journeymen, when paid by the day. There are greater variations here in the price paid for labor than in any other city on the continent, for the reason that where money is plentiful, the best workmen are in the greatest demand and are certain of obtaining proportionably higher wages than elsewhere. Al though wages have fallen greatly—not less than fifty per cent.—from the standard of 1849, still they are higher here than they ever have been in any other country under the sun, save in New Orleans and Mobile from 1830 to 1845. In Australia, which we believe now comes nearest to us in the proportionate demand for labor, the prices are about twenty-five per cent. less than here: and in the Northwestern American States, which ranked next to Australia in the reward of labor, at least until the commencement of the Southern rebellion, wages are fifty per cent. lower than in California. No doubt many who leave our shores circulate the report abroad that the mines are worked out, and that this is no country for a poor man. That the mines do not always enrich men as in former times, there can be no question, but as to the second proposition, we may point to the subjoined figures, and may add that the cost of living in San Francisco is very little above that of New York. In addition to the present prices, we give those labor commanded here at intervals in former years:

Per day.	June, 1853.	Jan. 1856.	June, 1861.
Blacksmiths - - -	\$5 @ \$7	\$5 @ \$6	\$3 @ \$4 00
Brass Founders - - -	6	5 @ 6	3 75
Pattern Makers - - -	7	5 1/2 @ 6	4 00
Moulders - - -	7	5 1/2 @ 6	3 75
Boiler Makers - - -	7	6	4 00
Machinists - - -	7	5 @ 6	4 00
Carpenters - - -	7	3 @ 5	3 @ 4 50
Shipwrights - - -	7	3 @ 6	5 @ 6 00
Carriage Makers - - -	4 @ 6	4 @ 5	3 @ 4 00
House Painters - - -	5	5	3 00
Grainers - - -	—	—	3 00
Paper Hangers - - -	5	4 @ 6	3 @ 3 50
Stone Masons - - -	8	7	4 @ 5 00
Bricklayers - - -	8 @ 10	6 @ 7	5 00
Plasterers - - -	8	6 @ 6	4 @ 5 00
Hodmen - - -	5 @ 6	2 @ 4	3 00
Stevedores - - -	7	6	3 00
Caulkers - - -	7	7	5 @ 6 00
Millers - - -	6 @ 10	6 @ 8	4 @ 6 00
Musicians - - -	20	16	15 00
Jewellers - - -	9	4 @ 6	5 00
Washerwomen - - -	5	4	3 00

The above class of laborers generally "find" themselves Those below—who work by the month—are generally found in board and lodging, in addition to wages:

Per Month.	June, 1853.	Jan. 1856.	June, 1861.
Engineers - - -	\$210	\$210	\$150
Clerks (without board) - - -	60 a 200	40 a 150	50 a 200
Gardeners - - -	60	40 a 70	35 a 40
Nurserymen - - -	—	60 a 80	50
Farmers - - -	60	30 a 40	25 a 35
Circular Sawyers - - -	—	60 a 90	30
Wood Choppers - - -	—	40 a 50	75
Quarrymen - - -	—	80 a 100	50
Bakers - - -	—	50 a 80	75 a 100
Confectioners - - -	—	75	80
Teamsters - - -	—	30 a 40	30
Hostlers - - -	—	30 a 50	40
Waiters - - -	40 a 70	25 a 50	30
Male Cooks - - -	70 a 100	50 a 100	50 a 75
Stewards - - -	50 a 100	40 a 80	50
Women Cooks - - -	60 a 80	30 a 70	30 a 35
Housekeepers - - -	—	—	50
Seamstresses - - -	40 a 70	30 a 40	30
Chambermaids - - -	45 a 60	30 a 40	30
General Housework Girls - - -	35 a 70	25 a 40	20 a 25
Nurse Girls - - -	25 a 55	15 a 20	20 a 25
Milliners - - -	—	—	50
Seamen - - -	30 a 45	25 a 30	25
Printers, per 1000 ems - - -	1 1/2	1	75 cts
Brickmakers - - -	—	—	35 a 50

There are some classes of mechanics, for whose work there was very little demand up to 1857, such as book-binders, tailors, shoemakers, glass-blowers, potters, and cabinet-makers, because almost all of our books, clothing, boots and shoes, cabinet-ware, glass-ware and pottery, were imported from New York. The demand for most of these has much increased at present. The above list includes about all the kinds of mechanical labor required here up to 1856. The following kinds have since come more generally into use, and we give their rates of wages: cabinet-makers, \$3 50 per diem; shoemakers, \$4 and \$4 50 per bottom; barkeepers, \$65 and \$85 per month.

It may be mentioned in this connection, that in the prices paid for board at first class hotels, for shaving and hair cutting, for clothing made to order, for prime liquors and cigars at retail, for individual articles of fancy ware and *vertu*, for washing by the piece or dozen, and for many other necessities and luxuries of life, there has been little or no reduction on the rates demanded five years ago. The staple goods, although fluctuating greatly, command at present about as fair prices as were obtained in the years 1856 and 1857.

A man advertises for a competent person to undertake the sale of a new patent medicine, and he adds that it will be found profitable to the *undertaker*.

Lost Ships.—It is stated that forty-four American vessels, ships, barks, brigs and schooners, were lost on various waters in the month of May.

GRAPE CULTURE.—The climate and soil of California, says Capt. W. D. Porter, U. S. N., in correspondence recently published in a city journal, are peculiarly adapted to the cultivation of the vine, and I have no doubt that the wine crop will, in time, exceed the amount of gold produced annually, and hence, should the few remarks made by me through your paper, induce parties to turn their attention to the cultivation of the vine, I will consider myself amply rewarded. Among the vines of Italy is one denominated *de Asti*; this is produced from a very prolific character of vine, and far superior to champagne. It is thought it will not bear transportation across the Atlantic; but this, I think, is an error, as I have succeeded in taking it to New York, and I found it good after keeping it a year. It is produced in such abundance that it can be purchased at the rate of three cents a bottle. In putting up cuttings from the coast of Syria or any of the Greek Islands, or Asia, care should be taken not to tie them with a cotton or hemp string, or put any paper label on them, as it will cause the cuttings to be detained fifteen days at Malta, in quarantine. The cuttings should be about three feet long, have attached to them some old wood, and be packed in a common flour barrel, with one end open. The English steamers run direct from Beirut to Malta, touching at Smyrna and Athens; after leaving Malta, they touch at Gibraltar. Cuttings from all parts of Italy can be consigned to the Consul at Gibraltar, who will forward them to the United States, via England. Vines can reach California from Syria in 50 days; from Spain, in 38 days; from Madeira, via Portugal, in 40 days. To the above may be added, for unnecessary delay, 10 days. The cutting, will keep, with a certainty of growing, 120 days; provided they are protected from the action of damp and salt water. Cuttings that sprout during the voyage are seldom as good as those that are backward; in fact, cuttings require but little care, and in 100, at least 60 will go a long voyage sale. It is the after cultivation of the vine where the most care is required, and as vines arrive at a very old age, it will, in order to ensure a good vineyard, be essential that experienced persons should be selected not only to obtain cuttings, but to cultivate the vine.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Considerable activity in mining sales during the last ten days up at Virginia City.

Potosi, \$200 per share.
Central, \$700 per share.
Opbir, \$1100 per share.
Gould & Curry, \$300 per share.
Chollar, \$15 per share.
Lucerne, \$20 per foot.
St. Louis, \$4 per foot.
Mount Davidson, \$60 per share.
Mark Anthony, \$8 per foot.
Louise, \$18 per foot.
Bradley, \$6 per foot.
Sacramento, \$8.
Shelton Co., \$5 per foot.
Josephine, Flowery, \$10.
West Brauch, Flowery, \$8.
Harrison, Flowery, \$12.
Yellow Jacket, \$40.
Exchange, East Comstock, \$25.
Moute Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$12.
Ohio and Buckeye Co. Argentine, \$12.
Chimney rock, \$16.
Durgin, \$10.
Rich Co., \$3.
Miller, \$12.
Augusta, \$6.
Spanish Co. Plymouth Ledge, \$6.
Chelsea, \$8.
Caney Ledge, \$25.
Edgar Co., Great Western Ledge, Gelena, \$25.

Number of Shares to the Foot.
Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.
[Having completed all the requisite arrangements, we lay before our readers a reliable list of prices of mining stocks of Utah.]

DOWS' DISTILLERY,
SAN FRANCISCO.

THE PROPRIETOR OF THE ABOVE ESTABLISHMENT IS NOW MANUFACTURING about 3000 gallons of WHISKY daily, and is prepared to furnish the trade with ALCOHOL, PURE SPIRITS and HIGH WINES, of a quality equal, if not superior, to any imported, as Wheatalone is used in their manufacture. Purchasers can be supplied with lots to suit at the depot, No. 214 Sacramento street. (mh8) E. T. PEASE, Proprietor.

LARGE GAS HOLDER.—It is said that the Imperial Gas Company of London, are contemplating the erection of a gas-holder 300 feet in diameter. The great gas holder at present in use by this company, is 201 feet in diameter. The largest gas holder in this country is at the Philadelphia gas works. It is 95 feet high, and 163 feet in diameter.

BITUMIZED PIPES. The demand for bitumized water, gas, and drain pipes, seems to be considerably increasing in England, where the manufacturers have been compelled to enter into a contract for the erection of an addition to their already extensive works.

WHEELER & WILSON'S

A. KOHLER,

NO. 178 WASHINGTON STREET, SAN FRANCISCO.

Forty Cases of Musical Instruments Just Received.

Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS.
Also, TAMBOURINES, BANJOS, PIPES, FLUTES, CLARION PICALOES, VIOLIN BOWS, BOW-HAIR, ROSIN, BRIDGES, PEGS, TAIL PIECES, FINGER BOARDS, TUNING FORKS, SSS ROMAN STRINGS (four lengths and four thread), and

ALL KINDS OF MUSICAL INSTRUMENTS,

Fresh every two months from Italy.

All of these goods will be sold to the trade, as they are direct importations from the manufacturers of Europe, and imported in large quantities by A. Kohler. He will sell them THIRTY PER CENT. CHEAPER than any other house in California; therefore it would be the interest of all to call and examine before purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by the case.

The wholesale department of this House is on Sansome street, occupying the whole block from Clay to Commercial street.

California Lloyds.

This is an association of some of our wealthiest citizens as a Board of Underwriters for Marine risks, upon the plan of Lloyds at London. It is not an incorporated company. At present it consists of ten persons of well known and acknowledged ability in business matters, and representing capital to a large amount. The number may be increased hereafter, and doubtless will be, as acceptable names are presented; but it is the policy and intention of the present subscribers to exercise a rigid scrutiny in regard to every member of the association, and to admit or retain none who do not add strength and weight to the Board. An entrance fee of \$500 is required of every member. The affairs of the Board are managed by a monthly committee of three, but each member subscribes all risks for himself, and is responsible only for the amount of his subscription. At present no risks are taken which are not satisfactory to all, and every individual member takes an equal portion. In this they differ from Lloyd's at London, and we think they may find it advantageous to modify the practice hereafter. A party seeking insurance through them must be satisfied with the responsibility of every individual composing the association; for if one fails he has no recourse upon the rest for the amount of risk assumed by that one. The Board have adopted a regular tariff of premiums, which serves as a guide to the managing committee, and is changed from time to time as circumstances may require. In another respect they differ from Lloyd's at London: all premiums are paid in cash at the time of effecting insurance instead of being carried to account. To this there can be no objection. If the cash rule were extended to every department of business, it would be far better for the community.

This increase of insurance facilities of a home character is an encouraging feature in our affairs. In former years we have paid a tribute of millions to companies abroad, and that, too, without being always sure that they were solvent; although of some, there can be, of course, no doubt—they have weathered the storms of ages. But we particularly commend the plan of this new Board. Hitherto, the personal liability clause in our Constitution, making every individual liable for all, has hindered, though it has not entirely prevented the formation of corporate companies for insurance purposes; but the method of Lloyd's obviates all that difficulty and furnishes, at least, an equal guarantee against loss.

—Prices Current.

NOVEL IRRIGATION OF FRUIT TREES.—John W. Carey, of San Jose, says the *Mercury*, has invented a cheap and convenient plan for irrigating fruit trees, that strikes us as being a little ahead of anything of the kind yet discovered. His plan is this: he takes a bucket, an old paint can, or anything that will hold water, and filling it, places it near the tree. He then takes a bit of rope, of sea grass or hemp, and wrapping it twice around the body of the tree, slightly below the top of the bucket, suspends the two ends in the water. There you have the whole apparatus. It acts upon the principle of the syphon, and keeps the body of the tree constantly wet, feeding the roots with a steady supply of moisture. This proves an effectual remedy for the borer, and works in every way to his entire satisfaction. The bucket should be filled as often as once a day, and no other care or trouble is necessary. Mr. Carey is satisfied that this method of irrigation for trees is destined to supersede all others, and from what we have seen of it as applied to his trees, we are inclined to the same opinion.

FARMING AT TEHAMA.—A correspondent of the Red Bluff Independent, writes from Thomas Creek, in the Upper Sacramento Valley, as follows:—"The grain crops in this vicinity are only tolerable; many of them being light, and much of the grain having lodged by the action of the late storm. From the same cause, a large amount of hay will be rendered worthless for any purpose except maoaring. If we had the benefit of the rain lately fallen, three weeks ago, all would have been right; but as it is now, I am afraid it will prove a terrible misfortune to stock-raisers and those who may have large numbers of cattle. The pasture that was on the plains, although dry and parched, afforded some sustenance heretofore, but now it will not, and will be of no service to anything. Hundreds of cattle which have not the benefit of an inclosed pasture, will doubtless perish, as the foothills—their usual summer resort—have also failed to raise their hitherto plentiful crop of wild oats. In addition to all this, myriads of grasshoppers are destroying garden vegetables."

CHARLES CANY MINING Co.—The certificate of incorporation of the Charles Cany Mining Company, has been filed in the County Court. The capital stock of the company is \$50,000, in \$30 shares, and its business, mining in Devil's Gate District, Carson county, Nevada Territory. The Trustees are Ozden Hoffman, John A. Monroe, D. O. Williams, Alexander E. y, Donald Davidson, Edward Cany, and William Gibb.

GRASSHOPPERS.—In many localities in Sacramento county, says the *Union*, grasshoppers have made their appearance in myriads, and like the locusts of Egypt, are destroying the substance of the land. Orchards, gardens and grain fields, which are yet green, are being rapidly destroyed. This is reported to be the case, more especially north of the American river. They are said to emerge from the foothills, and like the star of empire, westward take their way.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—Our recent additions to our extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp-shoes and dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months; Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Smit Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lam's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This Mill will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the State a Thousand Fold!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe.

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work. The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
- 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- 12th. We invite Farmers wishing a machine to call and see before purchasing.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Mau & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$5. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of Interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as a gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

The Willows.

We offer, for the gratification of our many readers in the country, another admirable picture of the Willows, from a different point of view to that given in the last issue of the MINING AND SCIENTIFIC PRESS. In the upper sketch may be seen visitors practising in the rifle and pistol galleries; others playing on the shuffle board; others again in the bowling alleys, or aiming themselves at the "barrel game." In the lower one the background exhibits the "Russian Swing" and "Flying Horses and Carriages" in rapid motion, bearing their joyous living freight with the most perfect safety. To the left is the Orchestral stand, in front of which the audience are listening and receiving with evident demonstrations of delight, a Union song, from the lips of one of our most popular warblers who bears in her hand the unsullied ensign of our nationality. To the right is seen a portion of the refreshment saloons, and in the foreground some of the pleasure seekers are enjoying ice-creams, strawberries and cream, and other delicacies of the season—their ears entranced by the gushing melody of the inspiring song, and the inimitable instrumentation of the crack orchestra of the State, under the conductorship of Mr. Herold and leadership of Mr. Schmidt—and all this beneath the grateful coolness of the shady willow trees. In other portions of the grounds are fortune wheels, macaroon roulette tables, Egyptian birds, and all kinds of other games for children as well as adults. Besides the secluded nooks, alluded to in a previous number, are large arbors of trellis work covered with vines and stands innumerable, where bouquets, toys, articles of vertu, etc., can be procured to satisfy the whim of the most fastidious. The attendance, although multitudinous, is most highly respectable, a large body of special police being constantly on the grounds. During the recent grand festival for the benefit of the church of Notre Dame des Victoires, not less than 70,000 ladies and gentlemen visited the Willows—among them, the elite of the city. Governor Downey and U. S. Senator Latham were also there, and were of course delighted—as who would not be, when the details of enjoyment are so elaborately planned and successfully executed by a master hand? We predict that the Free Summer Concerts at the Willows, every Sunday and Thursday, will continue to draw immensely throughout the entire season.

The only Riding School in the State is that of Orrick Johnson, and as many of our readers would like to see an illustration of the same, we append one, faithfully executed by our able artists and engravers. Mr. Johnson is master of his profession, and has been engaged in the Livery Stable business in this city ever since 1850. He is a Pioneer, having arrived here in 1849. Something less than a year ago, he decided upon opening a School where Equestrianism could be taught to ladies and gentlemen. It has been patronized beyond his most ardent expectations, but from our knowledge of the man, certainly not beyond his deserts. The three story fire-proof edifice in which his pupils are trained, is of brick, 40 ft. front by 85 ft. deep, situated on Montgomery st. (807 and 809) near Jackson. The first story is used as a Livery Stable, the second, as a Carriage Repository, and the third is entirely monopolized by the splendid arena in which his 180 registered scholars, of both sexes, are daily trained to proficiency in the great accomplishment of horsemanship. His graduated pupils are so many living testimonials of his great skill. They sit the saddle like demi-gods and goddesses. The terms for instruction are \$45 for 36 lessons, of one hour each, or \$10 for 15 lessons, including in-door exercises. When the pupil desires out-of-door instruction, the prices are double. Mr. Johnson keeps constantly on hand 40 of the best trained horses—harness or saddle—that can be found in the State, and all in splendid condition. He also takes the best care of horses belonging to others, having ample accommodations therefor. It is ridiculous to see awkwardness on horseback, and we advise all our lady and gentlemen friends, who are not first-rate riders, to go to Mr. Johnson for a course of instruction.

SUBURBAN RESORTS.

ORRICK JOHNSON'S RIDING ACADEMY.

LYCEUM BLOCK.

CALIFORNIA LLOYD'S—MARINE INSURANCES.—Office, Southwest corner of Washington and Battery streets. The undersigned are prepared to issue Marine Insurance Policies, each being responsible for the sum written against his own name only, and for himself, and not for the others, or any of them.
JOHN PARKETT, JAMES DONOHUE, G. F. C. JOHNSON,
WM. E. BARRON, N. L'NING, JAMES OTIS,
JAMES FIFLAN, JAMES B. HAGGIN, LAFAYETTE MAYNARD,
J. MORA MOSS.

EVERYONE will recognize the exte engraving of the old Lyceum Block, presented in the present issue of the MINING AND SCIENTIFIC PRESS. When it was occupied as a theatre, it was one of the worst looking edifices in town, but its owners, Messrs. Hentsch & Ritter, spared no money to make it one of the handsomest. Architectural ingenuity and taste have performed prodigies in its wonderful metamorphosis, and it is now the most elegant structure to be found either Washington or Montgomery street—at whose junction it stands. The lower story is occupied by stores—prominent among which is that of Mr. J. K. Prior (No. 703-705, Montgomery street and 6 Washington St.) the well-known gas-fitter. The basement is tenanted by Mr. Chas. Duveneck, and is called the Shakespeare Saloon, where billiards and oysters at choice drinks may all be indulged in. The second and third stories are divided in very convenient and well lighted rooms, most of which are occupied by lawyers. The building has a front of 137½ feet on Montgomery street, and 70 feet on Washington street.

McCarthy's Automatic Safety Valve.

Agreeable to a call by L. C. Fitch, Esq. to attend the trial and operation of the important invention, we repaired to the Pacific Mechanical Bakery, Bush street on last Thursday. Our readers will recollect to mind the illustrations of April 6th at 13th, appearing in the MINING AND SCIENTIFIC PRESS, when we gave complete and full details thereof. On the first page of this issue may be seen a sectional view of the valve. The one applied to the boiler of the Pacific Mechanical Bakery is circular in shape. The capacity of this boiler being near 100 lbs., the valve was set at 56 lbs. Quite a number of our citizens having collected together to witness the operation, their attention was riveted to the steam gauge at the exact moment when steam having reached to its required height, two pipes gushed forth a volume of water, saturating and partly putting out the fire. In less than one minute the boiler was relieved, and the gauge noted 54 lbs. The next experiment was to put out the fire entirely. Steam was again allowed to generate and when, at its required pressure, the pipes again emitted water upon the fire till it nearly extinguished the whole. Mr. Fitch, the agent for Mr. McCarthy, during this trial explained every portion of it, enumerating its many important advantages. We have asserted long since that eventually such an application would prove indispensable to every passenger craft, and steam boiler wherever suitable, and we reiterate the sooner or later the people will demand for their safety this invaluable safeguard.

FOURTH OF JULY.—THE UNDERSIGNED HAVING, a meeting of the citizens of San Francisco, held for the purpose of making arrangements for the proper celebration of the approaching anniversary of the National Independence, have appointed Grand Marshal for the occasion, respectfully requests all military companies, Battalions, or Regiments, all composing the Fire Department, and all Civic Societies, or other organizations of every kind whatever, which propose to take part in the proceedings, the day, to report such intention to him, through their proper officers, in writing, at the earliest practicable moment. It is desirable that each report should state, as nearly as may be, the number of members of the particular organization reported, which may be expected to parade; and, as this Anniversary is to be celebrated under circumstances which peculiarly call upon all, who love the Union, to exhibit their respect and veneration for the day, it is hoped that every citizen will join heartily in its observance.
ALEX. G. BELL, Grand Marshal, No. 2 Armory Hall.

RE-OPENING.

J. K. PRIOR—BEGS leave to inform his friends and the public, that he has recently enlarged and otherwise improved his establishment, and having received by late arrivals very large stock of

GAS FIXTURES AND PLUMBING MATERIAL

He is now prepared to receive Orders for Gas Fitting and Plumbing in all its branches. All work warranted to give entire satisfaction. The TRADE are invited to call and examine his stock before purchasing elsewhere.

SAN FRANCISCO, SATURDAY, JUNE 29, 1861.

NO 14.

ASSAYS OF MINERALS CONTAINING GOLD.

Furnaces.

CUPELLATION.—In order to ascertain the amount of the precious metals, *i. e.* the silver and gold contained in the buttons of lead obtained by the foregoing operations, they are subjected to a process called cupellation.

This process is founded on the circumstance that when silver and gold are exposed, in a state of fusion, to the action of the air, they neither give off perceptible vapors, nor are oxidised, particularly when more oxidisable metals are present.

In order then to obtain the gold contained in the buttons of auriferous lead taken from the crucibles in which the fusions have been conducted, it is only necessary to expose them on some absorbing medium to such a temperature as may oxidise the lead, whilst the gold is not so affected. The oxide of lead, or litharge, which is thus produced, becomes rapidly absorbed by the porous substance by which the assay is supported, and nothing but a small button of gold, or of gold containing a certain quantity of silver, ultimately remains in the metallic state.

These supports are called cupels, and are made of bone-ash, tightly consolidated by pressure in an iron mould, which give to them the form represented by figs. 9 and 10.

A very convenient kind of furnace for the purpose of cupellation is represented by figs. 12 and 13. The first of these figures represents the furnace in elevation, and the second in section. This furnace, as shown in the drawing, is made of sheet iron, thickly lined with fire-clay.

10.

9.

The most important part of this apparatus is the muffle *m*, which is a small arched retort of fire-clay closed at one of its extremities, and furnished either with small holes or perpendicular slits in the sides and end, in order to allow of the free circulation of air through its internal cavity. The accompanying wood cut (fig. 11) represents a muffle of this kind, before its introduction into the furnace.

When fixed, it is so arranged that whilst one of its extremities is supported by a proper shelf, the other corresponds to the opening *d'*, to the sides of which it is carefully luted by a little moistened fire-clay. This position of the muffle in the furnace admits of its being readily heated on every side; whilst the opening in its ends and sides admit of the passage of a current of air from the door *d* into the cavity of the furnace. In this way the interior of the muffle is constantly traversed by a highly oxidising current of air, and the draught of the furnace is kept up by the addition of a long chimney of sheet iron *c*. To light this apparatus a little ignited charcoal is introduced by the opening *d*, and the cavity of the furnace afterwards filled up with the same fuel; the whole of the openings must be now closed by their proper slides, with the exception of the ash-pit *a*. Instead of charcoal, good hard coke, broken into small pieces, may be employed; and when the muffle has become red hot, six or eight cupels, which have been previously drying on the ledge around the chimney, are taken by tongs of the form shown, fig. 14, and placed on the floor of the muffle. This, to prevent its being corroded should any lead be spilt upon it, is previously covered by a thin layer of pounded bone ash.

11.

The opening *d* is now closed by its doors, so as to prevent the introduction of a current of cold air, and the cupels are thus raised to the temperature of the muffle itself. When this has been done the door is again removed, and into each of the cupels is introduced, by a pair of slender steel tongs, a button of the alloy to be assayed. The door is now a second time closed during a few minutes, in order to facilitate

12.

by which it seems to be made to revolve with great rapidity. At this stage of the operation the agitation will be observed to cease suddenly, and the button, after having for a moment emitted a bright flash, becomes brilliant and immovable.

This phenomena is called the *brightening* or *coruscation* of the metal, and a button remains on the cupel, which, if the original mineral merely contained gold, mixed with the more oxidisable bodies, consists of that metal in a state of almost chemical purity; but if the ore be argentiferous, as well as auriferous, it will be composed of a mixture of gold and silver.

The litharge employed in the first stage of this process, for the purpose of supplying the lead necessary for an assay, in almost every instance contains a certain portion of silver, for which due allowance must be made in the results obtained. In order to do this, it is necessary to ascertain, by a preliminary experiment, in what amount silver is present in the lead reduced from such litharge; and having ascertained the weight of the button obtained, the proper reduction is calculated, and subtracted from the button of alloy obtained. When, however, the fusion has been conducted by the aid of nitre,

the fusion of the alloy, and on its removal each of the cupels is found to contain a bright convex metallic globule, in which state the assay is said to be *uncovered*. The air thus admitted rapidly converts the lead into litharge, which, as fast as it is produced, is absorbed by the bone-ash of the cupels; and at the same time there arises a white vapor, which is gradually carried off through the openings in the sides of the muffle. An annular stain is also formed around the metallic bath: this gradually extends, and penetrates into the substance of the cupel in proportion as the metallic globule itself diminishes in size. When nearly the whole of the lead has been thus converted into litharge, and absorbed, the remaining bead of rich alloy appears to become agitated by a rapid circular movement,

it is extremely difficult to arrive at accurate results by this means, and consequently in all such cases, as well as when the ore contains silver in addition to gold, recourse must be had to the process of *parting*, which will presently be described. If, after the brightening of the button, the cupel were immediately removed from the muffle, the metallic globule would be liable to *sprout* or *vegetate*, by which its surface would not only be covered by numerous iridescent asperities, but a portion of the metal would probably be thrown off and lost. This effect is only produced when a portion of silver is present, and it appears to be partly due to the sudden cooling of the surface exposed to the air, which by its contraction compresses the liquid metal contained in the interior, and causes it to burst through the outer coating. The effect is, however, chiefly owing to the expulsion of oxygen gas, as silver is known to absorb that body when in a fused state, and again to part with it at the moment of consolidation. The oxygen in this case would almost appear to be mechanically combined.

(To be continued.)

It is perhaps not generally known that the finest, mealiest, and most nutritious potatoes are always denser and heavier than those which are soft and waxy. An English inventor has taken advantage of this to select the best by what he calls a "Patent Gravity Potato-Selector." In order to classify potatoes into three qualities he uses two solutions, one of a specific gravity of 1.100 and one of 1.080. Only the best potatoes will sink in the first; the medium potatoes will sink in the second, while the poor ones will float on the surface.

M. Roy has found that the fever which is so prevalent in Algeria is due to the fact that in the region of volcanic and primitive rocks the clay contains phosphorous, and this acted on by fogs and dews, which contain ammonia, diffuses its noxious qualities in the atmosphere and occasions fever. By the way of testing this theory, he created an artificial atmosphere of this sort, and, on breathing it, found he had all the symptoms of the African fever.

Portions of the Atlantic cable recovered show not the slightest symptom of decay or deterioration in the gutta percha. It has been subjected to severe electrical tests, and, on comparison with the tests as it left the gutta percha works three years ago, it is found that there has been an actual improvement in its condition since it was laid down. In Trinity Bay, the iron wires were found partially coated in many places with copper known to exist under water off the Newfoundland coast.

Oxyd of chromium, when reduced to fine powder, is one of the best reducing and polishing substances known; it is superior to the finest emery for polishing steel. The best iridium-pointed gold pens become useless when used for writing signatures for a few hours over the green chrome ink that is sometimes printed on bank bills.

The *Chemical News* announces a discovery by which the new colors mauve and Magenta are printed not only with superior bloom and lustre to anything before seen, but also in colors which stand boiling, soap and hard rubbing.

Ebenite, called in this country hard-rubber, is pronounced by electricians to be superior to glass for experimental purposes. Mr. Varley has an electrical machine with a disk of ebenite three feet in diameter.

The Belgian Government has followed our own in the use of nickel in small coins. The Belgian pieces are to be of the value of 1, 2, and 4 cents, and will contain at least 25 per cent. of nickel.

Forests attract rain: a country stripped of its forests is likely to suffer from drought.

14.

13.

San Antonio Falls.

These falls are nearly in the center of Calaveras county, six miles west of the Big Trees, and about ten or eleven east of Cave City. They are plainly seen from the Cave City and Big Trees road, on gaining the top of the ascent east of Dr. Teach's old ranch. The dividing ridge between the Calaveras and the San Antonio is here nearly as high as the ground on which stands the Mammoth Grove. The soil and rock, however, are volcanic, and though the timber is large, it by no means compares with the lordly forests which shade the granite region. To the north, looking from this lofty ridge, the disjointed, quaint buttes of Table Mountain are distributed along toward the Mokelumne, in the direction of Railroad Flat for five or six miles. To the south, as far as the eye reaches, are tall, dark woods. Westward we catch a glimpse of the Coast Range, looming like the haze of an Eastern Indian Summer, over all the intervening hills. Close at hand in a deep canon to the right, (looking eastward,) are the falls, appearing at the distance of a mile, like a narrow veil of silver hung upon a precipice. A quarter of a mile nearer, and we catch that unmistakable "rise and fall" which characterizes the music of a water-fall mellowed by distance. We advance to a moss-covered rock within a quarter of a mile, and sit down to rest and gaze. There are three leaps in the fall—in the aggregate 120 feet—all close together. On either hand are perpendicular cliffs of dark volcanic rock, here and there tufted with clumps of bushes or dwarf cedars, and crowned with tall pines and the bright green black oak. In the canon, just below the Falls, and for the most part on the south side of the stream, is a dense growth of fir, pine, cedar, alder, maple, willow and mountain poplar, thickly intermixed with hazel and many varieties of berry-bearing shrubs, which ascend and line the sunny slopes. The water of the San Antonio here is as clear as crystal, very cold and filled with trout. It is said that in the vicinity of the Falls there are a good many grizzly bears, foxes, wild cats, squirrels, mountain quail are plenty, and now and then a grouse is heard among the firs, but rarely seen. Eagles, hawks and vultures have their nests in the high rocks overhanging the falls, hundreds of feet above the water, and at all hours of the day may be seen careering through the sky and over the woods or silently watching from their rocky perch the wary motions of their prey. We saw a fine specimen of the California black eagle, with pinions spread, and carrying in his talons a snake apparently three feet long. He made for a high overhanging rock, and we saw him land and devour his prey.

At any season of the year—winter excepted—the climate at these falls is delightful, and the water unsurpassed in coolness and clearness. We again commend the San Antonio Falls as a pleasant resort for recreation and amusement.—*Ex.*

LONDON STREETS.—John B. Gough, the great Temperance lecturer, in speaking of the streets of London, says:—"Within the twelve hours devoted to business, it is calculated that 125,000 vehicles pass through the city. There are 900 to 1,000 omnibuses, upon which the Government duty is a penny per mile; and that amounts to \$7,000 per week. One omnibus company alone, in one year, ran 595 omnibuses 223,000 miles. There are 4,700 cabs in London. It is estimated that the fares in the public vehicles amount to \$10,000,000 per year. In 1857, 13,500,000 persons left by the trains from the London Bridge Railroad Station alone; and in 1859, the total number of travelers who left by the different lines of railroad was 30,000,000. A return was made to the Board of Aldermen of the travel upon London Bridge for 24 hours; and here is a procession for you: there were 4,483 cabs, 4,286 omnibuses, 9,245 wagons and carts, 2,430 other vehicles and 54 riding horses; total 20,498. The passengers were—in vehicles, 60,836; and on foot, 107,074; total, passing London bridge in 24 hours, 167,910. No wonder the countryman said he had 'been a waitin' for five hours for the procession to get by.'"

STEAM SHIPS IN THE ROYAL NAVY.—A return to the House of Commons, obtained by Mr. Corry, M. P., has been issued of the number of steam line of battle ships, iron cased ships, frigates, corvettes, sloops, gun vessels, and gun boats, on the 31st of March, 1859, and the 31st of March, 1861; the number building, the aggregate number built, with other particulars. On the 31st of March, 1859, there were 387 ships afloat, building, and converting; and on the 31st of March, last the number was 479. In the period of two years, between the 31st of March, 1859, and the 31st of March, 1861, the number launched was 71; the number converted 13; and the total number added afloat was 84. The number of ships built, represented by 8ths, executed, on new ships, 72 15-16; and the tonnage built, not including tonnage added to converted ships, 108,658. The horse-power of the ships afloat on the 31st of March, 1861, was 118,203, showing an increase in the two years of 28,481. In March, 1859, the amount paid for engines not delivered, was £40,180; and in March, 1861, the amount was £232,050.

The ordinary burden of a camel is seven hundred and fifty pounds. With this load he will travel at two miles an hour, for from sixteen to eighteen hours a day, continuing this service for weeks, with only one pound of food and a pint of water daily.

The feed water of boilers acquires a galvanic effect in passing through the upper tubes of surface condensers.

BREAD MAKING.—A writer in the *Scientific American* asserts that saleratus and soda in bread, have more to do with the thin bones, rotten teeth, and flabby looks of our children—large and small—than many would imagine. Liebig, and medical men of the first standing, such as Schwencke, Pitcairne and Orfile, also testify that the carbonate of potash, soda, and ammoniac, have a particular effect in breaking up the coagulating power of the blood, and inducing a diminished vital cohesion of the various textures of the body formed from it. The same writer adds: If medical men can be found so far behind the times as to testify in favor of the use of alkaline matter in food, leave them to be benefited by their own prescriptions. Good yeast is the best agent at present known to raise bread with; and when the sponge is set, it should be placed in a temperature of about 80°; and when it begins to work, it should be freely exposed to the air, so as to allow the carbonic acid gas to escape with facility. When fermentation is carried on in a close space, and the dough covered up, the quality of the bread is liable to be injured; for the more freely the gas is permitted to escape into the atmosphere, the better will be the bread. As soon as the fermentation has reached a certain point which bakers call "light," knead and bake it. The heat of the oven stops fermentation, and over fermentation makes sour bread. A certain degree of heat in the process of baking, changes the grains of starch into dextrine and gives that peculiar and agreeable flavor which lively, well baked bread has. Dead, doughy bread, is wanting in flavor—the heat of the oven being too low to develop the dextrine. Dextrine is soluble in water; starch is not. Thorough baked bread is easier of digestion than when it is not well baked.

IMPROVEMENT IN STREET LANTERNS.—DeGrand's lenses are attracting a great deal of attention in Paris. They produce the same effect on a much smaller scale, and at a comparatively trifling cost, as the famous lenses of Fresnel, which are generally used in light-houses throughout the world. In ordinary street lamps, a large portion of the light is sent up overhead into the atmosphere, where it does no good, and it is very plain that if this light could be reflected or bent down into a horizontal sheet, it would be utilized, and add much to the light of the streets. M. DeGrand has found that thin lenses answer for the purpose, and that these may be made cheaply by softening the glass by heat and pressing it in a mould. Careful experiments have shown that by this interposition of these lenses, the light of an ordinary lamp is increased more than fivefold—from 1 to 5.49.

A SPLENDID OPPORTUNITY.

AGRICULTURAL MACHINERY.

A I have taken, for five years, a large portion of the State Prison Labor, for the sole purpose of manufacturing

AGRICULTURAL IMPLEMENTS AND CABINET WARE

I offer for sale, at a Great Sacrifice, in order to close out my present stock by September First, 1861, the following articles:

TWELVE-HORSE STEAM THRESHERS;

C. M. RUSSELL'S EIGHT AND TEN-HORSE THRESHING MACHINES.

J. A. PITT'S GENUINE MACHINES, FOUR, SIX, EIGHT, TEN AND

TWELVE-HORSE POWER, with all of C. M. Russell's Latest Im-

provements;

HAY PRESSES, REAPERS AND MOWERS;

EXTRA TRUCKS for Threshing Machines and WIRE TOOTH BUGGY HORSE

RACKS.

All of the above goods will be sold at the Lowest Prices, either for Cash, or

good approved paper at a low rate of interest.

THOS. OGG SHAW.

MISSION STREET BREWERY,

Mission st., near Second, San Francisco, California,

THE FINEST ALE AND PORTER ON HAND.

THE NEW METALLIC ALLOY.—"Oride" is a new metallic alloy, extensively used in this country as a substitute for gold. Stores have sprung into existence all over the country for the sale of it, and newspapers contain flaming advertisements of a "full set of jewelry for one dollar, being the stock of a large manufacturer," or merchant, "who is obliged to dispose of his stock on account of the panic." It is a French discovery, and is called by the French gold oride. It is manufactured to a large extent in Waterbury, Conn. It bears a very close resemblance to gold in color, density and fineness of grain; so close that it deceives every one but practical experts. Its component parts consists of pure copper, 100 parts; zinc, or (preferably) tin, 17 parts; magnesia, 6 parts; tartar of commerce, 9 parts; sal ammoniac, 36 parts; quick lime, 3/8 parts; and they are mixed as follows: the copper is first melted, when the magnesia, sal ammoniac, lime and tartar in powder, are added little by little; the crucible is now briskly stirred for half an hour, so as to mix thoroughly, and then the zinc is added in small grains by throwing it on the surface and stirring it till it is entirely fused; the crucible is then covered and the fusion maintained for about thirty-five minutes; the surface is then skimmed and the alloy is ready for casting. The fineness of grain in this alloy gives to those objects of art composed of it a delicacy and purity of detail that cannot be obtained from bronze. The alloy is essentially ductile and malleable and can be cast, rolled, drawn, stamped, chased, beaten into powder or leaves, or treated in any other way the artisan may desire. The discovery of this alloy is really wonderful, and its use will have a tendency to place within the reach of all, the useful, ornamental, and higher products of art. An immense number and amount of articles are manufactured out of this alloy, and sold South and West, and none but excellent judges can tell it from gold.

HUNT'S

IMPROVED FIRST PREMIUM WINDMILLS:

AN ASSORTMENT KEPT CONSTANTLY ON HAND AT THE MANUFACTORY,

Nos. 30 Second street, 208 & 201 Jessie street, SAN FRANCISCO.

THIS WINDMILL WAS AWARDED THE FIRST PREMIUM AT THE MECHANICS' FAIR OF 1860, in San Francisco, for its great simplicity, strength and durability. It is easily controlled, and will be sold cheaper than any other Mill built. Further particulars in circulars.

The following committee awards the above premium: Devoc, Garratt & Ware; all of this city.

PRICES.—Eight feet wheel, \$50; Ten feet wheel, \$75; Twelve feet wheel \$100 to \$125.

E. O. HUNT, Builder.

UNDERTAKING.—The undersigned would most respectfully inform their friends and the public that they have opened their

COFFIN WAREHOUSES

at 161 Sacramento street, below Kearny, and are ready at all times, night or day, to attend to every call in their line of business. Their stock is very complete, and will enable them to furnish every description of funeral, plain or costly, at the shortest notice.

All persons wishing to make interments in Lone Mountain Cemetery, can do so by applying to us at 161 Sacramento street.

MASSEY & YUNG.

METALLURGICAL WORKS

For the Extraction of Gold from Sulphurets and Quartz Tailings.—A Mining Engineer, thoroughly acquainted with this business, practically and theoretically, offers his services to a responsible party with the necessary CASH, for the construction and superintendence of works of this nature. Further particulars at the office of the Press.

VULCAN IRON WORKS CO.

P. TORQUET, MANAGER.

STEAM ENGINE BUILDERS, BOILER MAKERS, IRON FOUNDERS AND General Engineers, First street, near the Gas Works, San Francisco. Steamboat Machinery built and repaired; also, Saw, Flour and Quartz Mills, Pumping and Mining Machinery, etc.

The Vulcan Iron Works Co. invite the attention of Quartz Miners and others interested to their new style of Portable Dry Crushing Batteries with wrought-iron framing.

FIRE INSURANCE.

The undersigned offer insurance in the following well-known first-class companies, on the most favorable terms:

Hartford Fire Insurance Company, Hartford.

Phoenix Insurance Company, do.,

Merchants' Insurance Company, do.,

City Fire Insurance Company, do.,

Charter Oak Insurance Company, do.

McLEAN & FOWLER, Agents.,

Office—Northeast Corner of Clay and Battery Streets.

TO INVENTORS AND DISCOVERERS, MECHANICS AND MACHINISTS:

The undersigned, having had great Experience and Facilities for completing and carrying out Inventions and Improvements upon all kinds of Machinery and Implements, also preparing the requisite Drawings, Models, Drafts and Specifications, and is otherwise conversant with all principles in Mechanics of modern practice, and could prove, therefore, of invaluable aid to Inventors and Discoverers. Those contemplating bringing their inventions in a proper shape before the U. S. Patent Commission are particularly requested to consult the subscriber.

MODES OF PLACER MINING.*

The Quicksilver Machine.

The Quicksilver machine or Burke rocker, is a long cradle on stilts, with reservoirs of quicksilver in the bottom. It is about seven feet long, two feet wide and two feet high. An immovable riddle or perforated plate of iron forms the top of the machine throughout its length. Under this is the box containing a number of riffle bars, and above each one some quicksilver is placed. The dirt is thrown upon the head of the riddle, where a stream of water plays constantly through a hose, and the rocking motion of the machine and its downward inclination keep the dirt moving gradually toward the lower end, where the stones are allowed to escape, but the lumps of earth not dissolved are pushed back under the water and retained until they disappear. The quicksilver machine requires at least four men to work it, and in many places seven or eight men are necessary. It is suited only for fine gold, for if the gold be coarse it might be caught with far less trouble in the cradle, ton or sluice. The machine is cleaned once a day. All the gold is found in the mercury, which is squeezed through buckskin and the amalgam retorted. Quicksilver machines are great rarities in the mines now, though pretty extensively used previous to 1852.

The Board Sluice.

The board sluice is the most important of all mining inventions for washing dirt. It is a large wooden trough, from one to five feet wide, and from fifty to fifteen hundred feet long, or even longer—the longer the better. It has numerous riffle bars, and an inclination varying from an inch to an inch and a half in a foot. The larger and longer the sluice and the greater the amount of water, the steeper the inclination.

The sluice is made of inch and a half boards, twelve or fourteen (usually twelve) feet long, and in sections of that length. These sections or boxes are three inches wider at the top than at the bottom, so that they fit into each other. They can thus be put together, taken apart and hauled about with very little trouble. The boxes stand upon trestles, two or three under each box. Very rarely does the sluice lie its whole length on the ground. The inclination of a sluice is called its "grade." If there is a descent of twelve inches in each box of twelve feet—the descent being usually uniform throughout the sluice—it is said to have a "twelve inch grade"; or if the descent be eighteen inches, then the sluice has an "eighteen inch grade." The depth of the sluice box is from one-third to one-half of its width. Sometimes the sluice is made double, with a longitudinal division through the middle. The advantages of this plan are, that it may be used by two companies or one, that it can be used with a large or small supply of water, and that while "cleaning up" is in progress on one side, the ordinary washing may continue on the other.

A vast amount of dirt may be washed in a sluice. The largest size, four feet wide, will wash a mass twenty feet cubic of dirt in a day, equal to four hundred and fifty cubic yards; but this amount of dirt can only be supplied by a hydraulic. A small sluice will wash all the dirt that can be thrown in by from five to fifteen men. One man is often required to see that the sluice does not choke—that is, that large stones and lumps of clay do not collect in one spot to dam up the water and drive it over the sides. In small sluices, a "sluice fork" is sometimes used for throwing out the large stones. This fork is one invented for this special purpose. It has five tines, three inches apart, about a foot long; blunt, and of equal width from heel to point. The tines are made blunt so that they may not catch in the wood, and that stones may not get wedged in between them.

A constant stream of water enters the head of the sluice, and runs through its entire length. The size of the stream varies from twelve to two hundred inches. When the sluice is used to wash the dirt of a hydraulic claim, the amount of water is very rarely less than forty inches. From eighteen to twenty inches are, however, considered the usual supply for a board sluice not connected with a hydraulic claim, and that amount is called a "sluice-head."

In the bottom of the sluice are placed longitudinal riffle bars, which are six feet long, from two to four inches wide, and from three to seven inches high. They are put down an inch or an inch and a half apart, and are wedged in their places. There are two sets in a box, the riffle bars being only six feet long while the boxes are twelve. In rare cases the riffle bars cross the box diagonally, running downwards from one side, then from the other.

The great body of water rushing down through the sluice, hurrying with it many large stones, rapidly wears out the sluice boxes, or wood in them exposed to the friction. In hydraulic claims, all the stones run through the sluices, some of them weighing one hundred and fifty or two hundred pounds. Larger boulders are broken up with hammers, and reduced to a size which may be safely allowed to enter the sluice box. The sides of the sluice boxes are protected by boards, which must be renewed frequently. The riffle bars suffer most, and in hydraulic sluices must be renewed every week. A plan has lately been devised, however, to make "block riffle bars, sawn across the grain, and only two feet long. When fastened down in the sluice the grain will be perpendicular, and the wood will not be worn away so rapidly as when the grain lies lengthwise in the box.

The spaces between the riffle bars soon fill up with stones and dirt, but there are such irregularities in the surface that

there are numerous little cavities where the particles of gold, quicksilver and amalgam will be arrested. In a couple of hours after washing has commenced, some quicksilver is put into the sluice at the head, and it gradually works its way downward, catching gold as it passes along. When the riffle bars are placed diagonally in the sluice, they do not touch the side at their lower ends, but leave an open space through which stones and quicksilver can pass, and going through they strike the next bar, which carries them to the other side, and so they go rolling from one side to the other. A vessel of quicksilver, with a small hole in the side, so as to allow the liquid metal to escape in drops, stands at the head of the sluice, and these drops run their zig-zag course down the sluice, overtaking all the gold and catching some of it, and being themselves caught in longitudinal riffles near the end. These diagonal riffle bars are, however, very rarely used, and only in small sluices.

The period of time from the commencing to wash in a sluice to the cleaning up, is called a "run." In very large sluices, a run lasts till the riffle bars are worn out—usually in six or eight days, which is the ordinary duration of a run in all classes of board sluices. Many sluice miners clean up on Sunday; it is light work, and they have got into the custom.

Cleaning up commences with taking up five or six sets of riffle bars at the head of the sluice. Most of the gold and amalgam that was caught in these riffles, now lodges above the first set left in the box. A man with a scoop and a pan takes up this precious material; then five or six more sets of riffle bars are taken up, and so on.

From five to twenty men can work with a sluice. Most of the work is necessary to dig the dirt, and as this is done by the force of water in hydraulic claims, fewer men are required in hydraulic sluices than in others.

Mr. A. B. Paul, an authority in such matters, gives the following advice to sluice miners as to the best method of saving very fine gold:

"Get a sheet of copper-plate, say three feet long, but as much more as you like, and eighteen inches wide, or whatever width you may desire your sluice boxes. Also, get a sheet of iron-plate—or very heavy Russia iron might do. You want it strong enough to stand the wear and tear of sluicing, and of the same length and breadth as your copper plate. Have this iron perforated by slits half an inch in length, and not over a sixteenth of an inch wide, and not have the openings follow each other in a row, but change position on every half inch. So any fine substance floating over, is bound to go through some one of them. You will of course have the length of the openings to run with the width of the plate. These can be got up best by those accustomed to making screens for quartz mills.

"You now want some quicksilver, say ten pounds; and a pound of nitric acid, and we will then 'go to work.' You have all the material for working, excepting the sluice boxes. On opening the copper-plate for use, and which for convenience in packing, you have probably rolled up, you will see that it is hammered out and lies perfectly flat. Arrange your sluice boxes at whatever grade is best suited to the dirt to be washed, and of what length you want, as I have only to do with the last one. All being set, we will now line the bottom of the last box with the copper-plate, which, as I said before, you want to have as level as possible. Inside, and on each side, nail a strip of board, say six inches in width. This will hold the coppers in place, and keep the amalgam from working under the edges; besides, they act as the support for your own perforated plating, which now is set on the strips, and directly over the copper plating.

(To be continued.)

ASPHYXIATING EXPLOSIONS.—It is a well known fact that alkarsia, (a compound of the alcohol series, in which one component of oxygen is replaced by an equivalent of arsenic,) is peculiarly fitted for military purposes, although its use has been entirely neglected. A thin shell of iron, filled with this material, and fired from a gun, would explode only on striking its mark, when the alkarsia would take fire, burning with a fierce flame and emitting dense volumes of the most deadly poisonous gases. Such a weapon would never fail to reduce any fortress or stronghold in the shortest possible time. "Rougases," or explosives on the Jacobi principle, are very valuable in coast and fortification defenses. The explosive material consists of chlorate of potash and sugar, which, when brought in contact with sulphuric acid, instantly explodes with great violence. These last were used very extensively in the Russian war for the defense of both Sebastopol and Cronstadt.

MOUNTAINS OF AFRICA.—In England considerable excitement has been created among naturalists and geographers, by the startling discoveries recently made in Central Africa by a gentleman now in London, Mr Chayllon, a gentleman of mixed French and American blood, who, availing himself of the facilities given him by his position as son of a consular officer near the Gaboor river, has penetrated across the African continent on the line of the Equator, and has there discovered in a densely wooded region, a range of lofty mountains (one peak calculated by him 12,000 feet,) which contain, according to his conviction, the sources of the four great rivers of the African continent, the Nile, the Niger, the Tembeski, and the Zairo or Coago.

In less than twenty-five years the population of Australia has increased from 170 to 530,000 persons, and in ten years 23,000,000 ounces of gold have been imported from there.

GEOLOGY OF THE MOON.—Some optical appliances bring the moon sufficiently near to enable us to study her geology. No earthly scene can give any idea of the desolation reigning there. The whole sphere appears to have been formerly torn up from its very entrails. The so-called seas are generally supposed to be arid plains of sand. The circular ramparts of the mountains, in shape like amphitheatres, enclose vast craters with one or more cones rising from their bottom. These ramparts are broken by a multitude of breaches, and at their feet lie prodigious heaps of scattered rocks, which do not appear to be held together or covered by any vegetable mould. Lord Ross's telescope shows the flat bottom of the grand crater of Albatega to be completely sprinkled over with broken rocks; and Father Secchi has obtained a photographic image of the enormous fragments of rock which are piled at the bottom of the annular enclosure which forms the Circus of Copernicus.

M. Fave, a distinguished French astronomer, says that the moon's surface is quite new, so to speak; that is, it has undergone no wear and tear. The earth's superficies, although much more recent, have been worn and ground down in all directions by the continual action of wind and water.—The moon is the object in which to study plutonian action, or the effects of heat in all purity, and deserves more attention than she has hitherto received from competent observers. Her singular marshes, gulfs, and seas; circular valleys; her isolated mountains, standing on level ground, without any apparent rise of the surrounding strata; her rectilinear fissures, which look like canals dug by an intelligent hand; her innumerable variety of oblong hills, lying nearly in the same direction, with but a slight deviation from the meridian lines; the different shades of her soil, from the stellar brightness of certain peaks up to sombre gray and steel blue; all these diverse appearances make a strong appeal to natural history and geology.—*All the Year Round.*

The Nevada Water Works of Charles Marsh are rapidly approaching completion. The *Journal* says: In a few days hydrants will stand in every part of the city liable to fires, and no place in the State, or elsewhere, can boast of superior facilities for water for every purpose.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved

AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz.

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,

SATURDAY JUNE 29, 1861

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

CALIFORNIA'S SCIENTIFIC SOCIETIES.

In a recent number of the MINING AND SCIENTIFIC PRESS, we briefly alluded to the scientific society that exists in Alameda county, and at the time suggested that much good might be accomplished, if similar organizations sprung up in other counties, besides that and San Francisco. We are glad to learn from the Tuolumne Courier that there is a Scientific Association in Sonora City in a flourishing condition. According to our authority, the society has received the great electrical machine ordered some six months ago. It is a splendid one and the first of the improved English pattern ever made in the United States. It was constructed by Thomas Hall, of Boston, Mass., cost over \$300, and reflects much credit upon the skill of the maker, who says that although the spark thrown off is not so long, it is nevertheless more intense than in other machines made by him. The society is evidently enthusiastic in the cause, for it is rapidly accumulating a scientific library, apparatus and cabinet; besides being in treaty for the purchase of a suitable edifice in that city to place them in. Dr. Perez Snell, says our informant, is an enthusiastic *Philomath*, endowed with a scientific mind of a high order, is the life and soul of the institution, and we predict for it a long, prosperous and honorable career.

There may be scientific organizations in other counties than those mentioned, but we are unware of their existence. Why not form them in Nevada, El Dorado, Sierra, Placer, Calaveras, Butte, Amador, Trinity and other important mining regions? Many of these counties, to our own knowledge, contain enough gentlemen of scientific education, and with minds ever eager to drink from the pure fountains of science, to render such organizations permanent; and when we reflect upon the great results that might follow their labors—how each district would be more thoroughly developed in every way, and of necessity, more prosperous—we can but wonder that these gentlemen have been so inactive. Tennyson truly says that

"Science moves—but slowly, slowly,
Creeping on, from point to point."

And if all the world's scientific men were equally inert, She would inevitably come to a stand-still, or, perchance, retrograde. In Her Temple, labor many skillful workmen, from all parts of the world—and that vast edifice, like the ant-palace with its myriad of tiny laborers, rises only by the most unceasing activity of architects and builders. Story after story is erected upon the imperishable monuments raised by the master minds of every age, and hundreds of smaller columns in the long colonades, attest the noble exertions of their disciples. Science is Empress of the World. The whole earth bows down beneath Her benignant sway. She keeps a record of men and things and principles, as the years roll by; and that record is just to all. Let us all then, strive for a niche in that Temple, or at least honorable mention in that Book.

COLLEGIATE APPOINTMENTS.—Dr. L. C. Lane, late of the U. S. Navy, of whom mention was made in one of our recent numbers, as a nominee for the Professorship of Physiology in the Medical Department of the University of the Pacific, was confirmed to the place at a late meeting of the Board of Trustees of the School. The nomination of Dr. Henry Gibbons to the Chair of Materia Medica was also confirmed. The high qualifications of Dr. Lane to fill the chair to which he has been appointed, have been mentioned by us. The reputation that Dr. Gibbons formerly enjoyed as a medical teacher in one of the Philadelphia Schools of Medicine, conjoined with his proficiency in the Natural Sciences, render his appointment to the chair a judicious selection.

M. Testelin, in a little work published in Paris, attempts to show that the formation of the photographic image is a physical and not chemical effect. He considers the "electric polarity" to be the exciting cause.

[From our Special Correspondent.]
MONO COUNTY CORRESPONDENCE.

AURORA, MONO COUNTY, June 4, 1861.

EDITOR MINING AND SCIENTIFIC PRESS:—The mines in this section, as you remember, were discovered the latter part of August last, prior to which there was not a white man in this District. It was believed from the first, that there were a number of pay ledges here, from the good prospects found on the surface, but before this could be proven, winter came on, and everything being scarce, but little work was done until Spring. During the past three weeks a good many ledges have been opened, some showing favorable prospects, and others the reverse. A great deal of the surface rock is evidently rich, but how it will prove below, remains to be seen, only a few ledges having been opened to any depth. Some of these promise to pay, while others are said to be failures, the gold and silver diminishing as they go down, or the supposed ledge turning out to be nothing but boulders.

Population, Business Pursuits, etc.

There are now about 1,300 men in this District—some estimate the number higher—with seven or eight hundred at Monoville, and two or three hundred elsewhere in the county.

Of this number, over three-fourths are engaged in mining, the balance being employed in getting out lumber, quarrying stone, making brick, and in the various mechanical pursuits. I notice that nearly every business and calling carried on elsewhere, is, to some extent, represented here. Thus, we have already in this place 1 watchmaker, 3 blacksmiths, 4 carpenters, 2 tin and stove, 3 shoemakers, and 2 butcher shops, 2 drug stores, 3 bakeries, at least a dozen hotels, restaurants and lodging houses, at most of which liquor is sold, as well as at divers minor establishments. There are 2 Billiard saloons, and 4 places where gambling is carried on publicly; 1 assay and 3 express offices, at 2 of which the leading California and Eastern papers are to be procured, daily. There are a dozen places in the town where goods are sold, two of them being devoted wholly to hardware. We have 2 pretty well stocked livery stables, with a number of hay, lumber and brick yards, the latter rather extensive.

New Quartz Mills and Mining Prospects.

There is a quartz mill—an 8-stamp—Howland battery, in successful operation, driven by a twelve horse power engine, all of the best workmanship, built in San Francisco. The proprietors of this mill are Messrs. Green, Culver and Jackson. The superintendent and present engineer, Mr. S. S. Richardson, also of your city, where he is known as an ingenious mechanic, and the inventor of some valuable improvements in steam boilers. Other mills are expected here shortly, 2 being already on the road. It is the opinion of men who have had much experience in working quartz, that the prospects here will justify the erection of extensive mills and reduction works. Several such have lately paid this District a visit for the purpose of carefully examining and reporting on the mines, and have returned with the intention of getting in machinery as soon as possible. Of this class, nearly all leave favorably impressed with the inducements for investing money in working these mines, a fact that speaks in their favor, and has advanced them more in my good opinion than any thing that has come under my own observation, tending to establish their richness.

Prices of Labor, Goods, Etc.

In regard to the inducements for laboring men to come here, I cannot say that they are great at present. Everything worth claiming in the shape of mining ground is already taken up; the only chance for getting hold of this species of property being to prospect it on shares. A good deal of this is being done, the owners of claims giving a certain number of feet, and generally a little money, to have them opened. Where wages are paid, the prices do not vary much from those of California, \$50 a month with board, being given, or about \$4 per day, without, for drifting, sinking shafts, etc. There are no placer diggings here to which the miner can resort when hard pushed, nor is there any very extensive demand for general labor. When a man can get work, he receives about one-fourth more than in California. The prices of goods are, on an average, about double what they are in San Francisco, except clothing, which is not so much dearer.

Mining and Farming at Monoville.

At Monoville there are rich surface diggings, and of considerable extent, but like the ledges here, where there is water for working them, they are all taken up. Many of the claims there pay enormously, sometimes as high as a \$100 a day to the haul; others pay but moderately—some scarcely water rent—the diggings being very uneven, and the water limited and uncertain. Much prospecting is going on in various directions in the hope of striking other placers. These efforts will, most likely, be successful, this whole region being more or less auriferous. Very rich placers were found two years ago at Bodey, about halfway between here and Monoville. A great deal of the dirt pays 2 bits to the pan, yet there being no water there it amounts to nothing; and this it is to be feared, will be the trouble should similar deposits be found elsewhere. In fact, the great drawback throughout this entire country is want of water. This must always

operate as a bar to extended placer mining, as well as to farming. There is much fertile soil here, yet such is the extreme aridity of the climate that but little can be grown without irrigation, for which the facilities are very limited. Wherever there is sufficient moisture, however, supplied, vegetation thrives luxuriantly, the yield being almost as prolific as in California.

The Climate and Other Drawbacks.

Owing to this feature of the climate, and the general sterility of the soil, the few spots existing here, naturally adapted to cultivation, or so situated as to be susceptible of irrigation, are highly valuable. They have, of course, all been appropriated, and on some of them considerable improvements are being made. There are several gardens in this vicinity, one or two quite extensive, and of which, with good luck, will go far towards keeping our people supplied with fresh vegetables, a luxury we are now compelled to forego. The great obstacles with which our gardeners have to contend are the frosts—frequent even in the summer—and the vast number of troublesome insects, confined to no one kind, that prey upon their produce. Bugs, beetles, locusts and grass-hoppers swarm everywhere, devouring whatever green thing comes in their way. There are also, in many places, apt to be chemical agents present in the soil most unfriendly to the family of esculents, and which only years of culture can eradicate. But under all these disadvantages, the gardens are likely to do well, as the prices they will obtain for what is left them, cannot fail to be large, compensating for the deficient quantity.

THE GREAT EXHIBITION OF 1862.

In the last issue of the MINING AND SCIENTIFIC PRESS, we condensed the programme of the great exhibition which will commence at London on May 1st, 1862. According to promise, we now present the divisions in which the industrial and other products will be arranged:

SEC. 1. RAW MATERIAL.—Mining, quarrying, metallurgy and mineral products; chemical substances and products, and pharmaceutical processes; substances used for food, including wines; animal and vegetable substances used in manufactures.

SEC. 2. MACHINERY AND ENGINEERING.—Railway plans, including locomotive engines and carriages; carriages not connected with rail or tram roads; manufacturing machines and tools; machinery in general as applied to industry; agricultural and horticultural machines and implements; civil engineering, architectural and building contrivances; military engineering, armor and accoutrements, ordnance and small arms; naval architecture; ship's tackle; philosophical instruments and processes depending upon their use; photography and photographic apparatus; horological, musical and surgical instruments and appliances.

SEC. 3. MANUFACTURES.—Cotton, flax and hemp; silk and velvet; woolen and worsted, including mixed fabrics generally; carpets; woven, spun, felted and laid fabrics, when shown as specimens of printing or dyeing; tapestry, lace and embroidery; skins, furs, feathers and hair; leather, including saddlery and harness; articles of clothing; paper, stationary, printing and book-binding; educational works and appliances; furniture and upholstery, including paper hangings and papier mache; iron and general hardware; steel and cutlery; works in precious metals, and their imitations; jewelry; glass; pottery; manufactures not included in previous classes.

SEC. 4. FINE ARTS.—(Modern)—Architecture; paintings in oil; water colors and drawings; sculpture, models, die sinking and intaglios, etchings and engravings.

ENTERTAINING.—Our old and esteemed friends, Messrs. Lynch & Hughes have opened one of the handsomest Billiard and Refreshment Saloons now in the State. It needs only to be visited to be appreciated. It is intended also for Ladies who find Billiard playing the best and most amusing exercise.

HEAVES.—The Farmer and Gardener gives the following as a cure for heaves in horses: Take a smart weed, and steep it in boiling water till the strength is all out; give one quart every day, mixed with bran or shorts, for ten days. Give green or cut-up food, wet with water, during the operation, and it will cure.

PEACHES.—We visited the orchard of Patrick Sweeney on last Sunday and found his peach trees clear of the "cork leaf" and in a healthy condition. Mr. S. has about 3,000 trees full and almost breaking down with peaches, and a large number of apricots and plums also very full of fruit. They will be ripe about the 4th of July, then we will be able to speak of their quality. —*Petaluma Argus*.

GRAPE GROWING.—There are now 200,000 grape vines growing on the ranches bordering on Puta Creek, and in the Fall 200,000 more will be planted.

THE CROPS.—An exchange informs us that the farmers of Puta and Cache Creeks, who in dry seasons have short wheat crops, will have this year a fine yield of that cereal.

SUMMARY OF MINING NEWS.

CALIFORNIA.

SIERRA COUNTY.—The *Democrat* tells us that Sias & Co. have for some weeks been piping into this bank, at the head of Pearl street, Downsville. They have a good head of water, with first rate fall, and have made a big gap in the side of the mountain. . . . At Coyoterville, the Kentucky Company, working seven men, took out last week thirty-three ounces. . . . At Rock Creek, the Extension Company cleaned up last week, eighty ounces; eight hundred dollars over expenses. The Forest and Guatemala companies are doing well. The latter is getting into good pay; an indication of which is that the ground last week yielded considerable over wages. . . . In North Sierra a great calamity has befallen the Pittsburg Company, at Potosi, above Howland Flat. Their ground has caved, and the water is running at the rate of thirty inches an hour, and is nearly up to the mouth of the "incline." They will not attempt to work through the incline any more. They will wait till they drain tunnel—which is already in eight hundred feet—taps the diggings. They cannot get in before Christmas, with the best of luck; and if the rock should become difficult to blast, it will take them a year and a half. . . . An assay office has been opened in Alleghany, by Mr. Geo. W. Stilwell. . . . The *Messenger* informs us that at Gibsonville, the Berry Quartz Company are working an arastra. A man from Washoe recently arrived there, and upon inspection of this company's lead, says it is better than some ledges in Washoe that are selling at eight hundred dollars a foot. The company that has been running a tunnel under the Blue Nose Point, at the head of Hopkins Creek, have struck the Blue Lead—four bits to the pan. They are now building a reservoir for water, and think the lead will last one hundred years. . . . At La Porte, the claims of Gowell & Co. have been worked steadily during the season, by four hands who have piped off a space three hundred feet by one hundred and fifty. The bank is sixty feet high. With such a fall of water, it is no wonder that the claims present an interesting spectacle, with several pipes playing into the huge bank. We saw a most magnificent prospect in the diggings. Thirteen hands are now picking the bed rock, and within two weeks we shall doubtless report a big cleaning up. In Miller & Co.'s claims, next adjoining, four hands this season took out in sixteen days, between three and four thousand dollars—paying some \$650 water bill. Conly & Co. cleaned up after a run of one week, \$6,402. We saw at Eve & Crew's banking house the amalgam recently taken out—a common water-pail more than half full. It will retort some ten or twelve thousand dollars. Foster & Co. have worked their claims but little this season. We understand they realized \$2,200. On the other side of the opening is the Feather River Ditch Company's claims. These have been worked irregularly by the company in order to use the surplus water it was unable to sell to other parties. A good deal of top dirt has been piped off and some \$3,000 taken up. It will take some two weeks to make a final cleaning up. The gap caused by washing these mines, and old ones worked out still lower down, covers a space of twenty or twenty-five acres. The immense amount of gold taken from it is incalculable.

Calaveras County.—Coal, says the *Chronicle*, has been discovered in this county, in township No. 7. Some miners while prospecting for copper, found a bed of coal; specimens have been tried in the blacksmith's fires, and found to burn well. . . . The Quartz Mill at Salt Spring Valley, owned by Messrs. Morgan & Beatty, has been paying well. For the last two or three weeks it has paid about one hundred dollars a day, less expenses, which leaves a handsome profit. It is run by water taken from the Calaveras River, and is a very successful one. Rumor says a new town is soon to be started on the east side of Salt Spring Valley, near Carmon's Ranch, in order to accommodate the many miners who will be required to work the mines, if the prospects continue so good as anticipated. A correspondent visited the copper diggings, at Copperopolis and gathered several specimens of the ore, which lay out in vast piles ready for shipping. He says: "I was much pleased with the indications, and certainly think the Co. have the right 'dead wood.' They are looking for their claim, to the depth of about fifty feet, and at that depth find the copper ore about fourteen feet thick, and paying about one hundred and fifty dollars a ton; and I should think from the nature of the rock a haul could get out from one to three tons a day. If the lead continues as large and good as that claimed by the Union Company, there will be enough for all the Union men in the world, and some left for dissuolvents. A thousand years hence will find miles of the lead unbroken, and the Resurrection moving will find it inexhaustible. The San Antonio Independent states that a few days since the miners on the Keystone claim, at Copperopolis, dug out a mass of native copper, very little mixed with foreign substances, which weighed seven hundred pounds. The same day in the same claim, a mass of mixed metal, bright and pure, was dug out, weighing twenty pounds. The first mass is worth about one hundred and twenty dollars; the last four dollars. Copperopolis is thirty-three miles from Stockton. A railroad is being projected, which, if completed, would take the Calaveras County to the coast, and the whole country to Calaveras, and eventually all that of Nevada Territory, via the Big Trees. . . . At Chile Gulch, says a writer in the *Herald*, the Blue Lead no much talked of in former years, has been successfully traced, and is now affording a rich reward to the enterprising men who have risked their capital and labor in the prospect. Although Chile Gulch now occupies a large share of attention than any other single gold mining camp in the county, it is far from being the only prosperous one. All the old established camps being in a healthy condition, and new strikes, or rather discoveries, being frequent occurrence; but gold has had its day, so far as creating a panic is concerned, and quickly yielded the palm to copper. No man is considered fashionable now, who has no interest in a copper lead. From Copperopolis, where the richness of the mines are a fixed fact, nearly to Mokelumne Hill, the same indications are found, and thousands of claims are taken and staked out. An important town is springing up at the first point of discovery, named as indicated above, and the prospect is very bright. The whole country, from Mokelumne Hill to the scene of their future operations, all of whom seem confident of success. But Copperopolis is not without a rival, for it is known, within the past few days—say two or three weeks—similar indications of equal richness, have been discovered near Clark's Ditch, on the Big Tree Road, about six miles above Railroad Flat. This discovery caused much excitement, and hundreds rushed to the point to secure claims, but the best and most favorable opinion is, that any one who wishes to acquire confidence in it, are spending their money to test fully its richness. It will not long be secret whether or not this discovery is valuable.

Mono County.—The attention of our readers is directed to the very interesting letter from our special correspondent at Aurora, in another column of the *MINING AND SCIENTIFIC PRESS*. We collect news from our ex-changes as follows: A resident of Monoville writes that the New Company bring their water a distance of thirteen miles, but up to the present time they have run but a few streams. There is a great demand for water and lumber. Water is twenty-five cents per inch, and seventy-five dollars per M. I think a majority of the claims now open will pay; yet there will doubtless be a number of miners who will be disappointed in their expectations. Francis & Co., Sonora, are pumping it out weekly. Farrel & Star, and a number of others, are doing well, and the smaller operators are making wages, (which is ten dollars per day). The new buildings are being erected, and business generally looks well. A correspondent of the *Journal* writes from Aurora thus: Many people are now coming in, and the number of inhabitants in the county is estimated at 2,500. Of this number about 1,400 are in this district, 700 at Monoville, and the balance scattered about engaged in various pursuits; some getting out lumber, some farming, but the greater part prospecting in small companies to the south and east of this place. The miners here are now getting to work pretty generally. Many ledges are being opened, and so far with very encouraging prospects, all that is now required is mills to extract the precious metals known to exist here in great quantities. Leaving out what may be beneath the ground, there are thousands of tons of rocks on the surface that will pay for being worked. This is found in the shape of boulders and drift rock, vast quantities of which are now being heaped up for future reduction. Of this loose material one will collect several tons in a day, selecting the best portion. Some of it is undoubtedly rich, as many have over a thousand dollars to the ton, and there is enough of it in sight to employ a score of quartz mills for years in crushing it.

Nevada County.—The National Informer states that the Town Talk Company at Grass Valley, have closed their hydraulic working for the season, on account of the failure of water, have commenced driving shafts, and have last they washed up the gravel, they took out on four shifts, from which they realized one hundred and sixty dollars for the four first boxes—total expenses, drifting and working, thirty-nine dollars. They think that there is full as much more remaining in the lower boxes. This is getting it decidedly rich. . . . A correspondent of the *Journal* says that the district of Oregon is a very extensive one, and although mining has been carried on there since '54, the great gold rush has not yet been started, and now diggings are being opened and worked on all sides, while many claims that heretofore were comparatively worthless, by the new and improved methods of working are now paying well. Matteson's Water Power Derrick is a great improvement in labor saving. Nearly all the companies who have their claims opened, are running and making money; among which can be mentioned Marvin's, Perkins, Halagan's, Payne's, Bates & Shafer, Valmore's, Florence, Shorbaugh's, Morrill's &c. The claims of Tempier & Colbert, Kirby & Wilson and Lawler's, and many others on the head of Scotchman's Creek; it is thought to be the outcroppings of a blue lead, running back into the main ridge. Among the miners who still have surface claims, Halverson & Co., and M. Forest are the principal company's, whose claims have paid clear of all expense, from six to twenty dollars per day to the hand, all this season thus far. . . . The clean up of the Eureka, says the *San Joaquin Press*, last week, after an eight days' run, was \$12,000.

Plumas County.—A correspondent of the *Sierra Democrat*, writes from Eureka, that during the previous week, the following were the yields of certain claims there: James Smith, three hundred ounces; Morse & Co., fifty ounces; J. J. Jackson, twenty-four ounces; Last Chance, fifty to sixty ounces—per week. Small lots not mentioned. Some one hundred ounces, Jamison City to the Marysville Democrat, as follows: Jamison City contains about a dozen houses, and is compactly built upon a small flat, a few feet above the level of the creek. The placer diggings are upon the flats next the creek bed. The gravel is very coarse, from rocks of many tons weight down to the smallest pebbles. The gold is disseminated all through the gravel, but it is upon the cement that the coarse gold is found—some specimens being as large as half a dollar. The water here is about ten feet to twenty ounces. The bed rock is not visible for a space of four or five miles, as you go up and down the creek, and I know not how far the other way. It is a bowl-shaped cavity, filled up with cement and gravel. In '51 I predicted that if the bed rock could be found, that the richest diggings California had ever known would be found here; and lately the miners have determined to make a vigorous effort to reach bottom. Last fall a shaft was driven to a depth of about four feet below the bottom of the bed rock, and standing they ran two windlasses, and worked a double set above and below. This summer a pump will be procured, to be driven by water power, and if possible bottom will be found.

Shasta County.—From the *Shasta Herald* we learn that the diggings at Pittsburg are in a flourishing condition. A. Tetricks & Clements have just pocketed the neat little sum of \$2,375.00 for about four months' work with a hydraulic pipe. Babcock, Curle & Co., are now cleaning up Rich Gulch, where they have been piling all winter, with a fair prospect of a small pile. The Town Creek Company have got fairly to work in the bed of the creek. Their prospects are very flattering indeed. The Douglas Point boys have all done well during the winter season. Messrs. Silverthorn & Worley are now engaged in cutting a ditch from Squaw Creek, to work a bar that prospects from five to fifteen cents to the pan. The general impression is, that the back bars on Squaw Creek will all pay. If so the creek will afford employment to a good many men. Fawcett & Jones, who have been prospecting for a good many months, have at last struck good diggings on a flat, east and about a mile south of town. They have put down a good many shafts, out of which they get first rate prospects—one lump worth \$32, and several from two to twenty dollars. Capt. Bowls, with a company from Pittsburg, have been working for the past month, hunting up a dead thing, the old story—lost cabin—blazed tree—Old Tom Jones & Co.—a place where five men made \$21,000 in three weeks, all of whom were killed by the Indians except one, who escaped to tell the story and die. It is needless to say that they did not find the place, and have gone home, perhaps a little wiser.

Tuolumne County.—Last Thursday, says the *Courier*, Col. Thomas R. Stoddard discovered an extensive ledge of copperas about two miles west from Sonora. It prevades the whole earth, rock, and water, and thousands of tons of the blue copperas in the effluence can be easily obtained without a stroke of the pick. The mineral, however, is cheap, and is mostly used by the dyers, workers in leather, ink makers, druggists, etc. Mr. Frederick Ripperdon has shown us some of the quartz from his vein, adjoining the Middleton lode, near Sydney Gulch, on the ridge west of the road from Sonora to Shaw's Flat. He pounded out a small quantity, about a barrel of it, which yielded five hundred dollars and upwards. He is going to test a ton and see the result. . . . Messrs. Mulloy, Lyons & Co. in French Gulch, near Sonora, are taking out several ounces a day—three shares. Last Wednesday they took out ten or eleven ounces, one piece we understood to weigh forty dollars. . . . Mr. Jacob Green & Bernard Martin took out their claim, in the Old Hangman's Gulch, within the Sonora City limits, a day or two ago, one piece weighing eight ounces, besides otherwise doing very well. They have just begun to strike the lode, which has been test for the last five years. Close to where the eight ounce piece was found, \$1,100 worth was picked up five days ago, by the Mexican Company who was working the lode, on the last day they worked there. Many since have often prospected for the lode, but never could find it.

San Diego County.—The Southern News says: From Mr. N. S. Lewis, who has just returned from the mines on the Colorado, we learn that several rich lodes have been discovered at El Dorado Canon, which is about sixty miles north of Potosi. The assay of four different gold and silver bearing veins have been received by Mr. Lewis since his arrival here, one of which yielded \$401.23 in gold, \$22.70 in silver. The Indians in that quarter were beginning to show signs of hostility. Several of them who had been very friendly and well disposed towards the miners had informed them they (the Indians) must leave, as it would not do for them to aid the whites. They also advised the miners to move away their stock. Several animals had been killed by the Indians. The Pah-Utes, Mohaves, and two other hostile bands of Indians had united and had threatened to drive out all the whites in that direction. The several companies at Potosi had prepared for an extensive work at that place; furnaces were complete, and large quantities of ore were taken out, and a large amount of fuel accumulated; and now all was awaiting a meeting of the shareholders of the different companies, after which operations are to commence. El Dorado Canon is situated four miles from the Colorado, and which point is the head of steamboat navigation on the river.

Buena Vista County.—The *Visalia Delta* learns from a letter from Keyaville, hearing date of June 17th, that seventy-two tons of quartz recently crushed at Marsh & Kennedy's mill, yielded \$8,433. It was from the May flower lode, owned by Burgess & Mulrain. Some new diggings were recently discovered some thirty miles from Keyaville, of which says our informant that little is known, except that gold has been found over quite a space of country, but whether in sufficient amount to make it profitable, future prospecting will develop. Some fifteen or twenty men are at work there now.

San Bernardino County.—A letter from a person just from the Holcomb Valley mines, informs the *Southern News* that in that district, very little gold is being taken out now, on account of water in the lode. Great preparations are being made to work quartz, as soon as the mills now on the road reach their destination. Lane, Butler & Co., have about forty tons of rock ready for grinding, although they are now working their arastra. Colwell's Company are working their lodes, and the miners who own quartz, are now in full operation getting out rock for the mills.

OREGON AND WASHINGTON.

A letter from Isaac Capeland, appears in the *Oregonian*. It was written to a friend of his, from Pierce City, Nez Perces mines: "The mines are next thing to a humbug. There is a small spot here that pays from one dollar to forty dollars a day to the hand; but no show to get a claim. The country is pretty well prospected for thirty miles around, but nothing found that will pay. An excitement is raised every day or so a few miles off, but they always prove a humbug. Something may be struck yet, but I doubt it, for I have been around through the mountains myself quite a distance. I am not at work in the diggings, but have not got to washing yet; cannot tell whether my claim will pay or not. The show is not much in the way. The ground is very wet which makes it hard working. I will be back before winter. If you have a good thing save it; for if you come up here you will get a bad thing, no doubt." . . . It is believed that the "lost cabin," which has been unsuccessfully searched for a good many years, is at last found. It is about fifty miles from Yreka. Good diggings have been struck there and two or three hundred men are now making their way to fifteen dollars a day. The locality is kept rather secret. . . . In regard to the Nez Perces mines, a letter from Portland furnishes a different picture to that given above. The writer says: "We of this city confidently anticipate a rich harvest from the mines, and the majority of our capitalists have either gone some themselves or sent parties to see and make reports as to their richness. Many persons of undoubted veracity and good standing in our community, have returned from there and report favorably, so that, on the whole, we can safely come to the conclusion, that it will pay ten thousand men to work these mines. The season has been a very backward one, and in consequence extensive mining has been impossible, but as soon as the weather clears up and the snows disappear, gold in large quantities will find its way down here, en route to San Francisco."

ARIZONA TERRITORY.

From the *Messilla Times* we glean the following mining items: The recent clean up of arastra at Pine Alto proved very satisfactory to those interested the lowest pay from any rock being over fifty dollars per ton, which is a great deal paid over one hundred dollars a ton. It has been proved beyond a doubt that quartz mining in Pine Alto is profitable, and may yet be the great interest and support of our Territory. There will be at least twenty-five arastras running next month. The express from Pine Alto had arrived with considerable gold dust. Great excitement exists at Pine Alto in regard to quartz. Many are prospecting, and the discovery of paying ore is of frequent occurrence. The discoveries are reported of a copper vein, two silver-bearing veins, and one which is supposed to be iron. Mr. Rees, of the firm of Tibbault & Requier, who own the celebrated Tibbault claim in the San Jose gold mines, called at our office this week and showed us some of the specimens from their quartz claim. They were wonderfully rich. The quartz is much decayed—much of it of the consistency of dry loam, and pulverizes readily in the hand. In all specimens which we have seen the vein was visible to the eye; some were thickly studded with it, and in some of the smaller specimens it was the predominant material. The rock is light, flaky, and in small threads. The chips, one of which weighed five dollars, were composed of an innumerable number of threads and fibres partially suetted together. The vein can be traced for three miles, of a variable width, from three to eight inches. The wall rock is a loose slate. Every combination of fortunate circumstances to facilitate an easy and profitable working of the vein exists. The vein was worked both by Spaniards and Mexicans, and had the reputation of being the richest in all Mexico. Being on the extreme frontier of Mexico, it was subject to the continual drawbacks from the depredations of the Apaches, and the working of the vein was finally abandoned on that account, and remained untouched for many years. Messrs. Tibbault & Requier, in opening their claims, find many and extensive evidences of these older mining operations. They have sunk on the vein sixty feet and commenced operations, although a want of capital compelled them to do so on a small scale. They are now working two arastras. From a 'pocket' in their claim, thirty inches long and three and a half in depth, these gentlemen recently took out forty-eight ounces.

PHOTOGRAPHING THE BED OF THE OCEAN.—A photograph has been taken of the bed of the sea in Weymouth Bay, by Mr. Thompson. The camera was placed in a box with a plate-glass front and movable shutter, to be drawn up when the camera was sunk to the bottom. The camera, being focussed in this box on land for objects in the foreground, at about ten yards, was left down from a boat, carrying with it the collodion plate, and the shutter raised and plate exposed for ten minutes. The box was drawn up, and the image developed was of rocks and weeds; but the great advantage anticipated to be derived from this application of the art is to obtain a knowledge of the condition of piers, bridges, piles and structures under water. —*London paper*.

THE SUN GOING OUT.—There are now more spots on the sun than have been seen for many years; some of these are visible through a smoked glass to the naked eye. Several stars—some of them of great brilliancy which, from their ascertained distance, must have been as large as our sun—have totally disappeared from the sky; and the question has been raised by astronomers whether the light and heat of the sun are gradually fading away. As this would be accompanied by the destruction of all the plants and animals on the earth, it is rather an interesting question. The sun's light and heat are diminished by the dark spots, at the present time, above one per cent.

A French contemporary says that near St. Sevier there lives an old soldier with a false leg, a false arm, a glass eye, a complete set of false teeth, a nose of silver, covered with a substance imitating flesh, and a silver plate replacing part of his skull. He was a soldier under Napoleon, and these were trophies. He must be a splendid specimen of composite architecture.

A Parliamentary return just issued gives the number of vessels afloat in the British Navy. Of steamships there are 392 screw and 112 paddle—a total of 505; then 57 more are building or converting, and of effective sailing ships 126 are now afloat—making the enormous number of 688 fighting ships alone.

SAN FRANCISCO, JUNE 25, 1861.

EDITOR MINING AND SCIENTIFIC PRESS:—The series of articles preceding this series from me, related to teeth, their structure, development and preservation; also the uses, utility and administration of chloroform, having been copied by other papers and read, I trust, to no inconsiderable benefit by our people, I propose in this series, to give you the collateral results of chloroform on the human system, and show the effect superinduced on the cerebral functions of the brain, when under its influence. I will also exhibit the peculiar and wonderful phenomena of the office and function of the back part of the brain (cerebellum) when under any anaesthesia, or foreign element or agent. Any agent or influence that disturbs the cerebral powers of the brain (fore-part)—thinking, reflecting part—at once involves the entire man in a dilemma that clearly demonstrates that he is not constitutionally himself. It may be anger, sleep, enthusiasm, psychology, biology, opiates, anodynes, fever, ether, chloroform, or chloroform. The above agents at once intervene and suspend the volition of thought, while the central entity of the cerebral function is overpowered, which throws the subject out of his native and elementary constitutionality, and subsequently for the time being, is not subject to the natural law that governs mind or matter, but, so to speak, is a foreigner, while the involuntary portion of the brain plays magnetically all through the nerve centers and entities of the system. A man's bones, muscles and blood possessing largely magnetic properties, his affinities very naturally when in the above state, become more or less allied to those subtle agents and prominent forces of the mundane world, known among scientific men as the electric, odic forces or, more appropriately called the electrodes of the earth. This leads us to inquire into the cause of the singular expressions that often occur with brains thus hallucinated. The moment that the cerebral functions are suspended, the involuntary portion of the brain begins its work, and plays upon the nervous and mechanical combinations of speech, when all kinds of utterances go forth. This is more especially manifest, where there are large mineral lodes embodied in the earth giving character and force to the electrodes above alluded to. These electrodes or forces are most powerful, and so subtle that they occupy all elements and bodies where mineral, animal and atmospheric substances coalesce.

These elements or forces seize the functional power and entity of the back part of the brain, and man with the involuntary power of his mind is ushered into a world of hobgoblins, phantasmagorical spirits and spheres. He is now an emperor, an executive, a paramour, and a spiritualist. He descends a dream, and discovers visions; he is an astrologer, soothsayer, religionist, politician, and any and everything for the time being, until by the force and power of his natural and physical endurance, the agency of the above causes are overcome, and the fore-part of the brain resumes its function and office, and reason is enthroned in its shrine, and man is himself again. And now the patient will be perfectly astonished to hear you affirm that he has been the organ of all kinds of mysterious and ridiculous fancies. Few people understand the office, functional and latent power of the involuntary portion of the human brain, and hence they ascribe so much phenomena to the operation of spiritualists, rope tyers, biologists, clairvoyants, fortune-tellers, etc. A sharp observer will readily perceive that the present biologist at Magnire's Opera House always selects from the volunteers that go on the stage, those most susceptible to mysterious influence or mesmerism application, in fact those whose heads were, or are not of the best compact combination. You will observe that all those operators, from the Wizard of the North to Collins the rope-tyer, always select their peculiar material to make proselytes to their cause. The drunken debauchee in most ludicrous relations with the quadrupeds—his odor, like the goat, will often astonish the bystander with expressions, the conception of which may be happy and grand, as well as often low and bacchanalian—an evidence most striking that the brain is operated upon not only by alcohol but by an agency most singular, for no one will attempt to say it is the volition of the cerebral faculties, but the mechanical playing of his disarranged and abnormal relations with the universe. You can see this more clearly exhibited when there is a direct administration of chloroform or laughing gas. I daily witness this in my office when extracting teeth. Let the patient be near the battery or tools, his tongue will be incessantly on the move, but detach him from those bodies, he is as quiescent as a possum. Our next will treat upon the electrodes direct.

Very respectfully, yours,

W. H. IRWIN.

ANOTHER GREAT CAVE FOUND.—A cave, 2,000 feet deep has recently been explored near San Domingo, on the Tehuantepec route. It has been inhabited, as several broken jars have been discovered there.

QUEER.—The editor of the *Visalia Delta* has seen a potato vine having over a dozen potatoes attached to the top. In hoeing, the top had been bent down and partially covered with earth, and the result was the singular transformation above recorded.

M. Rousseau, a Belgian chemist, has invented an apparatus by which an ordinary cook can make enough sugar to last a family a week, out of materials which may be bought in any market.

THE USE OF TOBACCO.—The Dean of Carlisle, in a recent lecture on the use of tobacco, calculated that the entire world of smokers, snuffers, and chewers consume 2,000,000 tons annually, or 4,480,000,000 pounds weight, as much tonnage as the corn consumed by 10,000,000 of Englishmen, and actually at a cost sufficient to pay for all the bread corn eaten in Great Britain. Five millions and a half of acres are occupied in its growth, chiefly, cultivated by slave labor, the product of which, at two pence per pound, would yield thirty-seven millions of pounds sterling. The time would fail to tell of the vast amount of smoking in Turkey and Persia; in India all classes and both sexes indulge in this practice; the Siamese both chew and smoke. In Burmah all ages practice it, children three years old and of both sexes. China equally contributes to the general mania; and the advocates of the habit boast, that about one-fourth of the human race are their clients, or that there certainly are 100,000,000 smokers. There is a local effect of tobacco, when smoked, which we have not seen mentioned, and which, in a therapeutical aspect, may be of considerable importance; we refer to its action in preventing that peculiar condition of the throat which if neglected, is liable to terminate in follicular inflammation, or what is properly known as clegyman's sore throat. It has been said that few, if any instances of this affection can be found to exist in those in the habit of smoking, and we know of one or two instances where it yielded at once to the potent influence of tobacco. It probably acts by allaying commencing irritation, which if allowed to increase, would end in inflammation; and, perhaps, by counteracting any spasmodic condition of the surrounding muscles—a very natural source of trouble in this distressing disease.

Charles Simpkins, has purchased the old Frisbie lot, says the *Nevada Journal*, at the junction of Main and Washington streets, and a lot of hands are at work upon it preparing for the erection of works to supply the city with gas. We learn the works will be built in superior style and completed in a few weeks.

We have been shown, says the *San Andreas Independent*, divers specimens of silver ore taken from various places in this county within the past fortnight. A vein is said to exist in or near the western end of Salt Spring Valley, which has been taken up for several miles. Another one is in the neighborhood of Carson's, of which specimens of the ores taken from claims in Washoe, has been assayed, and is said to contain silver. So far it has not been prospected any great depth.

The first human sin was improper indulgence in eating, and it has been one of the chief sins ever since.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Considerable activity in mining sales during the last ten days up at Virginia City.

Potosi, \$200 per share.
Central, \$700 per share.
Ophir, \$1100 per share.
Gould & Curry, \$300 per share.
Coblar, \$15 per share.
Incene, \$20 per foot.
St. Louis, \$4 per foot.
Mount Davidson, \$60 per share.
Mark Anthony, \$8 per foot.
Louise, \$18 per foot.
Bradley, \$6 per foot.
Sacramento, \$8.
Shelton Co., \$5 per foot.
Josephine, Flowery, \$10.
West Branch, Flowery, \$8.
Harrison, Flowery, \$12.
Yellow Jacket, \$40.
Exchange, East Comstock, \$25.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$12.
Ohio and Buckeye Co. Argentine, \$12.
Chimney rock, \$16.
Durgin, \$10.
Rich Co., \$3.
Miller, \$12.
Angusta, \$6.
Spanish Co. Plymouth Ledge, \$6.
Chelsea, \$8.
Caney Ledge, \$25.
Edgar Co., Great Western Ledge, Helena, \$25.

Number of Shares to the Foot.
Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Incene, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.

[Having completed all the requisite arrangements, we lay before our readers a reliable list of prices of mining stocks of Utah.]

An attempt at acclimating the alpaca in Australia met with complete success. A flock which numbered 256 on their arrival a year ago, and was then in so bad a condition that thirty died soon after, now number 352.

An Australian tree, the *Collistemon Salignus*, is said to furnish wood equal to box for engraving purposes; a recent number of the Transactions of the Royal Society of Victoria contains a wood cut executed on this wood.

Some of the little borer-worms in the Mediterranean have a trick of making holes through the telegraphic cables.

In Paris, a large machine-making establishment is being constructed, in which electricity will be the only power employed.

A photographic fac-simile of the Domesday book is about to be taken in the photographic office of the Ordnance Department at Southampton.

A. KOHLER,

NO. 178 WASHINGTON STREET, SAN FRANCISCO.

Forty Cases of Musical Instruments Just Received,

Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS. Also, TAMBORES, BANJOS, FIFES, FLUTES, CLARION PICALOES, VIOLIN BOWS, BOW-HAIR, ROSIN BRIDGES, PEGS, TAIL PIECES, FINGER BOARDS, TUNING FORKS, SIX ROMAN STRINGS (four lengths and four thread), and

ALL KINDS OF MUSICAL INSTRUMENTS,

Fresh every two months from Italy.

All of these goods will be sold to the trade, as they are direct importations from the manufacturers of Europe, and imported in large quantities by A. Kohler. He will sell them THIRTY PER CENT. CHEAPER than any other house in California; therefore it would be the interest of all to call and examine before purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by the case. The wholesale department of this House is on Sansome street, occupying the whole block from Clay to Commercial street. mhs

How a Bed of Coal is Formed.

We are now in a position to comprehend the formation of a bed of coal in olden time. Let us suppose that a certain bed of coal has been completed by the growth of luxuriant plants over a low-lying tract subject to inundations from the sea. Rising ground of granitic or shistose rocks in the distance defines the margin of the basin, and the boundaries of a continent from which the sedimentary materials of the coal strata are derived. The growth of vegetation marks a period of rest; but now a slow subsidence of the whole tract commences. The brackish waters of the estuary, and the salt waters from the ocean, invade the jungle, carrying dark mud in suspension, with floating stems of trees and fronds of ferns. Presently the mud subsides, and covers in one uniform sheet the accumulated vegetation of centuries. The process of subsidence goes on, while the sea currents and rivers pour into the estuary fine sand and mud, in which branches and stems of trees from the uplands are included. This process continues until the sinking of the ocean-bed either altogether ceases or is counterbalanced by the rapidity with which the sediment is deposited. The basin becomes shallower, and the plants begin to reappear, commencing perhaps at the coast, and creeping seaward until the whole basin is again overspread by a forest of huge cryptogamic trees, arborescent ferns and conifers, with a dense undergrowth of giant grasses. These, generation after generation, flourish and die, their leaves, branches and trunks falling around and gradually accumulating, till the pulpy mass attains a thickness of twenty, fifty or one hundred feet. The process, concluded, the basin again commences to subside, the waters return and bury the mass for thousands of centuries stratum after stratum accumulates, till the vegetable pulp is subjected to the pressure of, it may be, thousands of feet of solid matter. Meanwhile chemical as well as mechanical changes ensue, and in process of time what was once a forest is changed into a bed of coal. By a repetition of this process, with local variations, we may conceive the formation of any number of coal seams, amounting, in some districts, to fifty or sixty, and embraced within a vertical thickness of several thousand feet of shales, clays and sandstones. Ages roll on, the strata are moved from their foundations; upheaved from the sea bottom, the breakers and currents sweep away a portion of the covering, and the mineral treasures are brought within the reach of mining industry.—*Hull's Coal Field's of Great Britain.*

TO DESTROY INSECTS IN STORED GRAIN.—Grain is sometimes subject to depredations from the flying weevil or gray moth, which develops and matures in the heart of the grain, and which imparts considerable heat to the bulk of the grain. The heat is equal to or above blood-heat. Grain infested with this insect is easily detected, on thrusting the hand into the body of the grain, by means of the great heat of the mass. Another insect is sometimes found in grainaries, and mills that depredate on the stored grain. In France, large quantities of grain are stored up against times of scarcity; and in order to protect it from the depredations of the insects that prey upon it, commissioners have been appointed to examine into the means of destroying them, who have reported that a small quantity of chloroform or sulphuret of carbon, put into the interior of the grain pit (which is usually in the ground) and then hermetically sealed up, will destroy all the pests. About seventy five grains of sulphuret of carbon are sufficient for about four bushels. Grain put up in grain pens, as is the custom in the West, may be treated with equal success with this agent, by covering the heap with a tarpaulin or close-woven cloth.

The *Solano Herald* says that on Wednesday the 12th inst. a large quantity of rain fell in Sonoma valley, surprising every one, as it was hoped and expected that we should have no more of the "rain tears" this season. Native Californians have said that "los yankees" have changed this climate by their occupation of the State, and we begin to think it is really so. This rain damaged a great deal of hay and spoiled the feed on the grazing lands, and will not have a tendency to raise the price of neat cattle and sheep from the present deplorably low rates. The "Clerk of the weather" will please take notice that we want no more such unseasonable visits. On Saturday the 8th inst., Vacaville and vicinity also, as well as a part of Suisun and Green Valleys, were visited by a heavy shower of hail and rain, accompanied by thunder and lightning.

BRITISH HOPES OF INDIA FOR COTTON.—Speaking of the attempt to negotiate a loan for the Confederate States in England, the *Baltimore Sun* says: A Southern planter recently arrived from Europe, a man of standing and of extensive information, says, as per a letter just received from a friend in New York: "Mr.—says that England will not lend the South a dollar and France cannot if she would. He says we have no idea of the energy with which England is prosecuting the cultivation of cotton in India and Australia. In India, 26,000,000 of acres are under cultivation for this purpose. As a planter he felt interested in investigating the subject. He says that in much less than 10 years she will need no cotton from America. Why will not the South see this?"

Mr. George E. Smith says the *Butte Record*, has shown us a diamond, found in the mining claims of Mr. Pierson, at Cherokee Ravine, valued at from fifteen to twenty dollars. This is the second one found in that locality, and as there is no humbug about it, undoubtedly more diligent search will be made for them hereafter.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our before extensive establishment, we can confidently announce to the public that we now have

The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp Shoes and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months; Mining Pumps of all sizes and kinds; Flouring Mills; Gang Saws, Malay, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russian Iron, Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Smut Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS
Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe.
Bartola Mill Company,
Ophir Mining Company,
Union Reduction Company, } San Francisco.
Ogden & Wilson.

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER.

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchasing.
- KNAPP, BURRELL & CO.,
ap19 310 (Old No. 80) Washington street, near Front, San Francisco.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AND AMERICAN PATENT AGENCY OF MESSRS. MUNN & CO., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of Interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM MR. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as a gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

THE AURORA.

Viewed as an Electric Discharge between the Magnetic Poles of the Earth, modified by the Earth's Magnetism.

BY BENJAMIN V. MARSH.

(Continued from our last.)

The negative light partly depends upon the substance of the wire. Particles of it, either pure or combined with the included gas, are carried off to the interior surface of the tube, which when platinum wires are used, consequently is blackened. If not acted upon by the magnet all the parts of the surface surrounding the platinum wire become black; if acted upon, only that line along which the surface of the tube is intersected by the magnetic surface is blackened. In this case therefore the particles separated from the wire move along magnetic curves.

The importance of the use of magnetic curves or lines of magnetic force, in experimental researches, has been shown by several philosophers, especially Mr. Faraday. Hitherto only filings of iron enabled us to give, in peculiar cases, an imperfect image of these curves. We may now trace through space such a curve in the most distinct way and illuminate it with bright electric light.

Dr. J. Baker Edwards, who subsequently made somewhat similar experiments, in speaking of the light of the electric discharge through an exhausted tube, says: "When this column of light is made to fall over the pole of an electromagnet it is attracted in the direction of the magnetic curves and rotates rapidly around the magnet, the direction of its motion being reversed when the polarity is altered or the direction of the current is changed.

Now if in these experiments we suppose the electromagnet to represent the magnetism of the earth—the negative wire the auroral "arch"—and the lines of magnetic light the auroral "streamers," are not the phenomena absolutely identical?

In an aurora the centre of the corona being the vanishing point of the nearly parallel streamers which compose it, it is evident that a streamer having its base exactly in this centre must be seen absolutely endwise, and must appear merely as a bright spot in the centre of the corona—the line drawn from the base of this streamer to the eye of the observer being a continuation of its axis. But it is found that this line always coincides with the direction of the axis of the dipping needle, at whatever place the observation is made, and, since the position of the dipping needle at any point on the surface of the earth is such that its axis lies in the magnetic curve passing through that point, it necessarily follows that the axis of the streamer in question must lie in a continuation of this magnetic curve, which for so short a distance may be treated as a straight line. Hence we must conclude that every auroral streamer lies wholly in the magnetic curve which passes through its base.

But an electric discharge from the parts of the atmosphere overlying the vicinity of the north magnetic pole, in passing toward the south magnetic pole, would, according to the law of Prof. Plucker, be compelled by the magnetism of the earth, to move along the magnetic curve passing through the point from which it starts. Hence as we find the auroral streamers occupying this very curve, presenting every appearance of streams of electricity, and revolving around the magnetic pole of the earth, just as Dr. Edwards observed the electric streams to do around the pole of the magnet, we seem justified in concluding that they really are currents of electricity passing from the auroral arch on their way to the south magnetic pole, or perhaps to a corresponding arch surrounding it.

If so it will probably be found that the phenomena in the two hemispheres, although simultaneous, are not identical, just as the appearances in the electric discharge in vacuo are widely different at the positive and negative terminals.

It is true that we have succeeded in tracing the streamers only five or six hundred miles, out of the many thousands they must traverse to reach their destination in the southern hemisphere, but their illumination even thus far beyond the supposed limits of the atmosphere is probably due in part to particles of matter carried from the arch, just as portions of the platinum wire were conveyed by the currents to the surface of the glass in the experiments of Prof. Plucker—and the invisibility of the streamers beyond this point may result from their great distance from the observer combined with the greater diffusion of the current and the absence of matter to be illuminated.

Whatever may be the material constituting the auroral arch, it does not seem capable of penetrating the denser portions of the atmosphere but rather glides over them with a horizontal motion. Its observed form and motions may perhaps be most readily explained by supposing it to originate as a horizontal stratum of cloud, of a circular form, having its centre vertical over the north magnetic pole, must, in commencing its motion southward (if there be any coherence between its parts) be converted into a ring, which would glide over the upper surface of the atmosphere, its diameter constantly increasing, like that of a circular ripple in water, as it moved towards the magnetic equator. In this case the ring itself would always occupy the position of a magnetic parallel of latitude; and the part of it visible from any place on the surface of the earth would appear as an arch with its ends resting upon the horizon and with its highest point on the magnetic meridian. Other similar

clouds successively formed over the pole and then impelled southward would present the same phases, and when they were sufficiently near to each other, an observer would see several concentric arches, as is the case in some auroral displays.

The material composing the arch seems, in the steadiness and mildness of its light, its rolling motion, and cloudy appearance, strikingly to resemble the glow which is frequently seen in electric discharges in vacuo and which is very remarkable in some forms of the "stratified discharge." In the "Proceedings of the Royal Society," vol. x, Nos. 38 and 39, Mr. J. P. Gassiot, in giving the results of numerous experiments upon the electric discharge through his carbonic acid vacuum tubes, describes many varieties of the "stratified discharge." In some instances several luminous cloud-like concentric envelopes surrounded one of the terminals, whilst in others cloud-like masses of light were successively developed from one of the terminals, whence they passed towards the other terminal and were thus arranged in a line between them—their development being greatly promoted by the presence of a powerful magnet.

With a water-battery of 3500 cells, these are represented as faint and cloudy in their appearance; and with Grove's nitric-acid battery of 400 cells, although the action was so intense that they became extremely bright, they still retained their cloud-like form and motion. In describing experiments made with this battery, the exhausted receiver being placed between the poles of the large electro-magnet of the Royal Institution, Mr. G. says: "On now exciting the magnet with a battery of tea cells, effluents strata were drawn out from the positive pole and passing along the upper or under surface of the receiver, according to the direction of the current. On making the circuit of the magnet and breaking it immediately, the luminous strata rushed from the positive, and then retreated, cloud following cloud with a deliberate motion, and appearing as if swallowed up by the positive electrode.

(To be continued.)

THE CROUP—SYMPTOMS AND REMEDY.—A wheezing in the throat, and difficulty of breathing, amounting sometimes to suffocation. There is also a short, dry and hoarse cough, resembling the barking of a small dog. Give the patient a sufficient quantity of lobelia tincture to nauseate the stomach. Wind a folded cloth, wet with cold water, around the neck and breast. Put a dry cloth outside, and cover it up warm in bed, so as to cause perspiration, and a cure may be effected in a few minutes.

METROPOLITAN THEATRE,

Montgomery Street, Between Washington and Jackson Streets.

On the site of the old Metropolitan Theatre.

JOHN TORRENCE & CO. PROPRIETORS.
CHARLES TIBBETS. ACTING MANAGER.

OPENING NIGHT!

MONDAY EVENING JULY 1st.

The Proprietors have the pleasure of announcing that they have effected engagements with the following distinguished artists:

MR. JAMES STARK,

The Talented Actor;

MRS. JUDAH,

San Francisco's Favorite Actress;

MISS MOWBRAY,

MR. JOHN WOOD,

The Favorite Comedian;

MR. H. COURTAINE,

MRS. BURRILL,

MISS M. MONSON,

MISS SALLIE CLARK,

MR. FRANK MAYO,

MR. H. D. THOMPSON,

MR. E. THAYER,

MISS A. MANDEVILLE,

MISS V. MONSON,

MISS ISABEL LAND,

MR. D. C. ANDERSON,

MR. GEO. MITCHELL,

MR. C. L. GRAVES.

CONSTITUTING

THE FINEST COMPANY IN THE STATE.

A SPLENDID ORCHESTRA

Composed of the best Musical Talent, conducted by

MR. CHARLES SCHULTZ.

Box Book open on Monday morning at 10 o'clock.

PRICES OF ADMISSION.

Dress Circle and Orchestra Seats \$1 00
Parquette 50
Second Circle 25
Private Boxes \$10 and 50

METROPOLITAN THEATRE.

The Great Star of Comedy,

MISS JOEY GOUGHENHEIM,

WILL APPEAR

ON MONDAY EVENING, JULY 1st.

THE NEW FRENCH CANNON.—The tub or harrel is formed of several cylinders, or rings of cast or wrought iron, its longitudinal cylindrical parts affording the means of uniting the rings. The interior of the tube is rifled by means of a number of projecting spiral rods, shaped in triangular prism. The tube can be lengthened at pleasure. The breech of the gun is a mortar, to which the tube is attached, and from which it may be detached, either for the purpose of loading it at the breech or of making use of it as a mortar. It is alleged that this cannon cannot become heated, that the process of cleansing after discharge is unnecessary, except as regards the breech, and that it may be fired four or five times during the space now required to fire any other gun.—*London Times*

NOTICE.—THE GENTLEMEN OF SAN FRANCISCO ARE RESPECTFULLY informed that their NEW BILLIARD SALOON, with EIGHT FIRST CLASS PHELAN'S TABLES, will be opened for business on SATURDAY, Jan 29th, 1861. The undersigned respectfully solicits the patronage of all Gentlemen Billiard Players, and hope by conducting their Saloon in an unexceptional manner, to merit their continuance and support.

D. L. LYNCH,
M. E. HUGHES.

LEWIS COFFEY & RISDON'S

STEAM BOILER AND SHEET IRON WORKS.

The only exclusively Boiler Making Establishment on the Pacific Coast owned and conducted by Practical Boiler Makers. All orders for New Work or the repairing of Old Work, executed as ordered, and warranted as a quality.

Old Stand, corner of Bush and Market Streets.

Opposite Oriental Hotel, San Francisco, Cal.

LEWIS COFFEY,

J. N. RISDON

near Howard.

TEETH! TEETH!
Extracting with out Pain! Dr. W. I. IRWIN, Dentist, Third street near Howard (opposite E. H. Wilson's Mission). All branches of Dentistry performed in the neatest manner.
Extracting, each, \$1.
Children's teeth, 50 cents.
Filling with gold, each \$1, \$2 and \$3.
Filling with platinum cement, \$1, \$2 and \$3.
Cleaning, whitening and burning, \$2, \$3 and \$5.
Straightening, etc., from \$2 to \$5.
Nerves killed and Tooth ache cured, \$1.
Whole or partial sets nicely and firmly adjusted on the finest gold, at from (each tooth) \$5 to \$10.
On the best silver plate (each tooth) \$3 to \$6.
Montgomery street Office, on the corner of the office open five minutes. Special attention paid to Children's Teeth. Circulars, given full directions to parents for the preservation of Children's Teeth. Remember the place—Third street.
W. H. IRWIN, M. D.

FOURTH OF JULY.—THE UNDERSIGNED HAVING, AT a meeting of the citizens of San Francisco, held for the purpose of making arrangements for the proper celebration of the approaching anniversary of the National Independence, been appointed Grand Marshal for the occasion, respectfully requests all military companies, Battalions, or Regiments, all companies of the Fire Department, and all Civic Societies, or other organizations of every kind whatever, which propose to take part in the proceedings of the day, to report such intention to him, through their proper officers, in writing, at the earliest practicable moment. It is desirable that each report should state, as nearly as may be, the number of members of the particular organization reported, which may be expected to parade; and, as this Anniversary is to be celebrated under circumstances which peculiarly call upon all, who love the Union, to exhibit their respect and veneration for the day, it is hoped that every citizen will join heartily in its observance.
ALEX. G. BELL, Grand Marshal, No. 2 Armory Hall.

SHAKESPEARE SALOON.

CHAS. DUVEHECK.

Billiards, Fine Liquors and Havana Cigars.

LYCEUM BUILDING,

Cor Montgomery and Washington streets.

CALIFORNIA LLOYD'S—MARINE INSURANCES.—Office, Southwest corner of Washington and Battery streets. The undersigned are prepared to issue Marine Insurance Policies, each being responsible for the sum written against his own name only, and for himself and not for the others, or any of them.
JOHN PARROTT, JAMES DONOHUE, GEO. C. JOHNSON,
WM. E. BARRON, N. LUNING, JAMES OTIS,
JAMES PHELAN, JAMES B. HAGGIN, LAFAYETTE MATNARD,
J. MORA MOSS.

Mining and Scientific Press.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. III.

SAN FRANCISCO, SATURDAY, JULY 6, 1861.

NO 15.

THE TOLAR CANAL.—It appears, says the *Call*, that this much talked of work is in a fair way of being completed. Some three years since the Legislature granted Montgomery, Samson and others the right to build a canal connecting the San Joaquin with the Tulare Lake. The whole length of the canal is to be about eighty miles. According to the terms of the grant the Canal Company is to have every alternate section of swamp land on each side of the canal, and to collect tolls for the period of twenty years. From some causes or other the original grantees could not put the work through, and the grant has now fallen into the hands of well known responsible men of this city, who have organized a Company, and now offer the public a chance to participate in the work. As will be seen by the advertisement, shares are \$400 each, and each share carries to its owner a deed for 320 acres of the best bottom land in the State. The completion of the canal will place this city in direct communication by water, with the largest and finest agricultural valley in California, and will besides add millions to the taxable property of the State. We are glad the work has fallen into the hands of such men as Polh mas, Center and Jones, for they are men who have the ability to put it through and in whom the public can place entire confidence. The contract for the work has been given out, and it will be pressed forward with dispatch.

RAILROAD ACROSS THE SIERRA NEVADA.—The *Union* says that the Central Pacific Railroad Company have filed their certificate of incorporation in the Secretary of State's office. This company is composed of citizens of Sacramento and adjoining counties, and the places from which the proposed road is to be constructed are Sacramento and the eastern boundary of the State, passing through the counties of Sacramento, Placer and Nevada. The length of the road is estimated at one hundred and fifteen miles. The capital stock of the company is to be \$8,500,000, divided into shares of \$100, twelve hundred and five of which have been taken. The Directors are L. Stanford, C. Crocker, J. Bailey, T. D. Judah, L. A. Booth, C. P. Huntington, Mark Hopkins, of Sacramento; C. Marsh, of Nevada, and D. W. Strong, of Placer county. The five Commissioners to open books of subscription, are B. F. Moore, of Dutch Flat; E. J. Brickell, of Ilinoistown; S. Cross, Sacramento; E. G. Waite, Nevada; E. McLaughlin, Grass Valley.

ANTI-BORER.—A correspondent of the *Union*, gives the following method to keep out the borer from apple trees:—Take old newspapers, or any other paper of their length, and wind about the tree, first displacing the earth an inch or two deep, taking care to replace the dirt closely around the paper sufficiently to hold the paper from moving or any possibility of the insects getting in at the bottom, then tie the top with a string and your tree is safe. They may in some instances get in above the paper, but should they, they can be readily seen and dug out. It will be necessary after this late in the season, to rub the body of the tree before putting on the paper, to remove any eggs that might be deposited. Watch your trees closely about the last of July and through August. I have tried the above plan and would recommend it as preferable to any other.

FOSSIL ELEPHANT'S TUSK.—Dr. Jones, of Murphy's, is collecting quite an interesting cabinet of mineralogical and miscellaneous curiosities. He has many rare specimens of ores—copper, silver and lead, and with other marvelous things, an elephant's tusk, or eight inches of the smaller end of it, in a perfect state of preservation, which was dug out of a mining claim at Douglas Flat, more than twenty feet from the surface. In the same cabinet is also a mastodon tooth of astonishing size and tolerably well preserved; also the skins of a silver gray fox and one or two other hybrid varieties of the fox caught in the snowy regions of the Sierra Nevada mountains.—*San Andreas Independent*.

THE COMET OF 1861.

On Sunday evening last, the citizens of Napa and adjacent counties discovered a first class comet in the Northern heavens. The succeeding evening it appeared in all its glory before the people of San Francisco, who crowded the streets to gaze upon the wondrous sight. This is the comet first discovered by Mr. A. E. Thatcher, of the New York Observatory, on the 4th of April last. From computations made by Mr. Safford, of the Cambridge (U. S.) Observatory, we learn that it reached the ecliptic about the 12th of May, crossing it in the heliocentric longitude occupied by the earth on the 19th of April, and at a distance from the sun equal to that of the earth at the same date. It reached its perihelion on the 4th of June, at noon (Washington mean time). Its further elements are given by Mr. Safford as follows:

Perihelion distance 0.9235 of the earth's mean distance from the sun.
Longitude of the Perihelion - 242° 20'
Longitude of Asc. Node - 29° 15'
Inclination 8° 14'

Mr. Peters, of the Hamilton College Observatory, wrote on the 18th April, that it was then entering from the constellation of *Draco* into that of *Ursa Minor*, continuing a Northwestern course. Therefore, for some time yet, it would remain above the horizon without setting.

The nucleus of this great comet, whose length is fully 75 degrees, is enveloped by a nebulous haze; said nucleus being about four times the size of a star of the first magnitude. The breadth of the tail varies from 3 to 5 degrees, and flashes out at intervals to even greater width. So too, with the length, which varies considerably. The peculiarity of this comet is its sudden appearance in full proportions. We present to the readers of the *Mining and Scientific Press* a well executed illustration of the lower section of this celestial phenomenon, as it appeared on the morning of the 1st.

Fruit-Time and Harvest.

The *Marysville Appeal* says:—The small fruits, such as apricots, cherries, plums, and a few sorts of early apples, with strawberries, blackberries and raspberries, are now quite plentiful in the market—indeed more so than we ever knew them to be before at this season. Greater attention appears to have been paid to planting the small fruits within a year or two, which is well, for they are wholesome, delicious and profitable. The flavor of some of them—cherries and apricots—is not so fine as it should be, on account of premature gathering. The cherries particularly are often bitter, and act on some delicate systems as a drastic purge, if eaten raw. We are sorry that more blackberries are not raised. They are a cheap, wholesome and popular fruit, and the Lawton variety yields prodigiously. A few peaches from the southern counties have been reported at the Bay, and at Sacramento.

The new crop of wheat and barley is coming into market slowly in Northern California, where the first sales were made as early as June 17th. At Stockton, new wheat is being received in large quantities. The *Argus* says "it is the intention of farmers in San Joaquin county to throw their crops into market immediately, preferring to realize present prices than await an uncertain advance. Many of our farmers are compelled to pay heavy rates of interest; and the probable advance over present prices, if any, would scarcely justify them in holding their grain in the anticipation that any advance would more than meet accruing interest." Barley is also coming into market. Both the wheat and barley crop will be larger than was anticipated. The apprehensions of mischief from rains, floods, winds, drouth, and grasshoppers were exaggerated as usual. It is thought the aggregate grain yield will be fully one-third more this year than last, and that it will be of better average quality—heavier and cleaner. There is very little complaint of smut. More care was this year taken in the selection and preparation of seed than ever before. They have been ranging for new wheat from \$1.50 to \$2; and for barley from 95 cents to \$1, the 100 pounds. When the quality of the crop is better ascertained prices may rule more steadily. We renew our advice to farmers to clean their grain well and put it in good sacks. The export demand for wheat is likely to continue, as the crops in England and France will be below average, and the yield in the Atlantic States will be reduced by the withdrawal of so many agriculturists for the defense of the Government.

WHEAT, FRUIT AND FLOWERS.—The *Marysville Appeal* speaks of some stalks of English wheat, christened "Bilney wheat," which are a specimen of a small patch grown on the farm of County Assessor, John Roule, Esq., near Marysville, from a handful or so of seed brought from the farm of Mr. Bilney, Chinn's uncle, in Essex, England. The stalks are over six feet high, and the heads measure over six inches long, the grain being large and plump, and crowded as thickly as it can be. The patch of wheat will yield about forty bushels, which Mr. Roule intends to keep for seed.

Also of some curious peaches grown by Mr. Krause—the surfaces of which are broken out with roughness, like warts but soft and pleasant-flavored as any. The skin of the fruit looks as though the peach had an attack of erysipelas, aggravated with the measles. All the trees in the same lot are similarly affected.

MINING IN TULARE.—On Saturday, July 6th, W. S. Sherman, Robert Bailey, R. A. Redman, B. F. Dewey and James G. Dow filed their declaration in the County Court, as copartners of the "Comet Silver Mining Co.," organized for mining in Tulare county. The capital is \$800,000, divided into shares of \$500 each—term, 50 years.

A Word to California Farmers.

We observe that the millers of California are bent upon making the farmers furnish them clean instead of dirty wheat. The millers of Yuba county, according to the *Appeal*, have declared that they will not encourage this nuisance any longer, and producers may be sure that wheat which was the refuse of their threshing ground and a heterogeneous admixture of unmerchantable rubbish in it, will find its proper price, and be classed with "rejected" or "inferior," when, with due care, it might command the highest current rates. There is no excuse, with the present present prices, for such a shiftless policy as has heretofore been pursued by our farmers, and it is to be hoped that this year's crop will be able to redeem the reputation of California wheat in foreign ports.

The *Napa Reporter* says, in connexion with this subject: We see by some of our late exchanges, that the large quantities of barley, oats, etc., present in the wheat shipped from California, has tended materially to deprecate it in value; and our farmers, and all interested in the grain business, should pay particular attention to this fact if they want a market to ship their surplus grain to. Practical millers have always felt the want of complete and perfect machinery for cleaning grain, or rather separating not merely wheat from the chaff and foul matter, but the wheat from the oats and other grain, which is often mixed in growing; and ingenious mechanics have experimented a great deal in trying to produce the machinery so much desired. Hitherto, but partial success has attended their efforts. It is with great pleasure then, that we call the attention of our farmers, millers, and the interior press, to the fact, that this want can now be supplied by the purchase of Turner's Improved Combined Smutter and Grain Separator—the most perfect machine of the kind in the world. It has no equal in scouring, separating, and otherwise cleaning grain from smut, chaff, grown wheat and other impurities. As wheat always contains, when brought to market, more or less smut, dust, chaff, and other foul stuff, and in passing it through a smut mill, if the grain be the least damp, the smut, dust, etc., are liable to adhere, it is absolutely necessary that the smut balls should be taken out unbroken, before the grain enters the Smutter, and the dust pass out as soon as scoured from the berry, that the grain may not wallow in it.

In this machine, the Smutter is composed of from three to seven sets of horizontal scouring plates between which the grain passes. The lower plater or runner of each set is provided with beaters, which throw the grain against the upper plate, which is stationary and also provided with beaters, thereby causing the grain to act against both plates with equal certainty and uniformity. A rough or sharp surface is not depended on for scouring, but it is claimed that what the machine will do the first month it will continue to do for years in the same manner.

The grain enters at the top, where it first falls upon a zinc or sheet iron riddle, through which the grain passes, taking off sticks, stones, etc., over it. The grain then falls upon the first inclined plane, then into the first blast from the fan at the bottom of the machine, which takes out most or all of the smut balls, oats, chaff, and other light impurities, before the grain enters the Smutter. This all millers know to be of the greatest importance, particularly if the grain be damp. The grain then passes out of the blast of the Separator into the Smutter, the dust passing through the perforated case opposite each set of plates, and drawn up into the top fan and carried out of the Mill if desired—the grain passing through the Smutter, discharging the heavy screenings at the angle in the enlarged spout.

The Machine is well ventilated, by a blast from the lower fan into the center of the Machine, by which there is no possibility of its ever becoming filled up or clogged with dust.

This Machine makes five distinct separations: 1st. The heads, sticks, etc., over the Riddle. 2d. Screening from the first blast, (which are the lightest), and before the grain enters the Smutter. 3d. The dust. 4th. Screenings from the second blast of the Separator, after the Smutter. These last are free from dust, and in good condition to grind for feed or otherwise. 5th. The clean grain, at the bottom of the Machine.

Only one driving belt is required, and but two in all—and can be as easily attached as any upright Smutter. Rolling screens may be dispensed with, except for cockle.

The step of the Smutter shaft is the only place from whence arises any danger from fire, by the friction of the Smut Mills; hence the absolute necessity of having the step always in sight, and convenient to be oiled, with no liability to run dry, from its situation being unapproachable without taking the Machine to pieces. All millers, and all vigilant and competent Insurance Agents, should thoroughly examine all Smut Mills and report to their principals,—whether the step of the Machine can be examined daily,—its facility for oiling,—its contiguity to wood,—the velocity of the Machine, and its liability to clog with dirt. As sad mistakes have been made in this important matter, all parties interested are particularly requested to examine this Machine. Aside from any danger from fire, the convenience of the miller should be consulted. He is desirous of knowing and should know to a certainty, that the step is oiled and in good order, and this he should be able to ascertain with as little trouble as possible, and as often as desired. In this machine the step is always in sight, and can at all times be examined and oiled as easily as any ordinary journal. It holds nearly half a pint of oil, and can at any time be drawn off and replenished. No

grit or dirt can remain in the step, but will be thrown off into a lower cavity. From these considerations the Machine is regarded fire-proof.

Millers and farmers desiring to obtain this valuable machine can do so by applying to J. SILVERSMITH, proprietor MINING AND SCIENTIFIC PRESS, No. 20 and 21 Government House, San Francisco—he being the sole agent for California. He would also be happy to confer with parties desirous of purchasing the right to sell the "Combined Smutter and Grain Separator," in any county of the State.

The Silver Mines of British Columbia.

Silver mining says the *British Colonist*, promises to become a leading feature in the industry of British Columbia. Already two companies are engaged prospecting their claims. One is near Fort Hope; the other, "The British Columbia and Vancouver Island Silver Mining Company," is at work on the shores of Harrison Lake, about 20 miles below Port Douglas. So far as the latter company have advanced, the indications are of the most favorable character. The deeper they descend into the vein, the richer are the specimens found. An assay made by Marchand & Co., under the inspection of a committee appointed by the British Columbia and Vancouver Island Silver Mining Company, yielded at the rate of 355 ounces of silver to the ton of 2,000 pounds. The assay was made in the fairest manner. Ten pounds of the ore was crushed and pulverized into an impalpable powder. From that, 10 ounces was weighed out and assayed, which yielded as above. No attempt whatever was made to select the best specimens; but the ore pulverized was taken just as it was quarried from the vein, consequently no fairer test could well be made. When it is recollected that the assay of the Harrison Lake lead is only made from ore taken out a few feet below the surface or out-croppings, it is fair to conclude that the farther down the vein is followed the richer will be the silver ore. Such is said to be an invariable rule in the Mexican and South American silver mines, and it is said to have been verified already by the company at work on Harrison Lake. Consequently in a few months we shall not be astonished if called upon to chronicle assays yielding \$1,000 or \$1,500 to the ton.

As silver mining is wholly a new branch of industry to our miners, the question now arises, how many ounces to the ton will pay? In answer we would state, that silver ore is shipped from Chile to the Swansea Smelting Works in Wales that will only yield fifty ounces to the ton, and yet at that rate it will pay a small profit. The best ore shipped from Chile to Swansea yields about 1,200 ounces to the ton of 2,240 pounds. When we take into consideration the probable cost of transportation to the place of shipment in Chile, the presumption is fair that silver ore that would yield 30 ounces to the ton of 2,240 pounds, would cover all expenses if it could be shipped at the mines.

It may be urged that freight from Chile to Swansea would be lower than from this port or New Westminster, and, therefore, if our silver mines yielded at the minimum rate, 50 ounces, we could not compete with Chile, nor pay a profit to the company. We do not see any good reason, however, to suppose that freight would be in any material degree higher from here than from Chile; and so far as transporting the ore from the interior to a port of shipment is concerned, the Hope and Harrison Lake Companies have every advantage. The Hope Company's mine is not a half mile from the banks of Fraser river, and the Harrison Lake ore is within a hundred feet of the shore. From the latter, ore may almost be tumbled out of the mine into steamers or lighters, and transported at a small cost to New Westminster; consequently, the ore is so very accessible for the purpose of shipment that it cannot but reward the companies well for their investment; and more particularly the Harrison Lake one, if it should continue to yield 355 ounces to the ton of 2,000 pounds.

Parties who have prospected British Columbia for silver speak favorably of the indications; and state that Fort Hope to Cayoosh, a distance of 120 miles, the whole country is silver-bearing. Should the pioneer companies at Hope and Harrison Lake be as successful as they anticipate, the silver mines of British Columbia are likely to command, in a short time, as much attention in Great Britain as those of Mexico or South America, or even Washoe itself. Capital, followed by population, will flow in, and a permanent branch of industry will be created, to endure for ages, or long after the gold deposits fail to reward the miner.

The Fort Wayne (Ind.) Sentinel says "the culture of the willow is proving one of the most profitable pursuits the farmer can turn his attention to. Any good corn land will grow the willow profitably, and our river bottoms that are less valuable in consequence of being subject to inundation, are just the thing to grow the willow. The crop is said to be a certain one, and far more remunerative than corn, while the expense and labor of cultivation are much less."

STRENGTH OF ICE.—Recent experiments in Germany show that when the thickness of ice is an inch and a half, it will just bear the weight of a single man. When about three inches and a half, it will bear detachments of infantry with their ranks wide apart. With the thickness of four and four-tenths inches, eight pounders can be conveyed over it on sledges. Five and two tenths inches will bear twelve-pounders. Eight inches will bear twenty-four pounders, and a thickness of twelve inches will bear almost any weight.

THE AURORA.

Viewed as an Electric Discharge between the Magnetic Poles of the Earth, modified by the Earth's Magnetism.

BY BENJAMIN V. MARSH.

(Concluded from our last.)

In another experiment with the nitric-acid battery Mr. G. says, "four or five cloud-like and remarkably clear strata came out from the positive." These were large lens-shaped masses arranged at regular intervals between the terminal wires, their flattened surfaces facing these terminals.

Now if in this case we imagine a small glass globe placed with its centre directly between the wires, it is evident that each of these cloud-like discs as it "came out from the positive" towards the negative terminal, must, while passing the glass globe be pierced by it, and be converted into a ring, just as the auroral cloud was supposed to take the annular form in gliding over the spherical surface of the non-conducting atmosphere.

This part of the auroral display may therefore prove to be some modification of the "stratified discharge"—the magnetic poles of the earth being the terminals, and the auroral arches being analogous to the cloud-like masses of light or glow described by Cassio, the magnetism of the earth aiding in their development.

In the "London, Edinburgh and Dublin Philosophical Magazine" for December, 1860, Prof. Rijke of Leyden mentions that M. Perrot had shown that the spark from a Ruhmkorff coil consists of a bright point of light combined with a "luminous gas," which he had succeeded in separating from it; and that while the ordinary spark is entirely unaffected by magnetic force, this luminous atmosphere appears affected in precisely the same manner as the voltaic are under similar circumstances. Now as the voltaic are tends to revolve around the pole of a magnet, this "luminous atmosphere" or glow must do the same; and if the material composing the auroral arch be of the same nature we should expect it also to revolve from east to west, or the reverse, around the magnetic pole of the earth—the direction of its motion corresponding with that of the streamers. In the display of August 28th, 1859, such was actually observed to be the case, the fragments composing the arch, as well as the streamers, having a rapid motion from east to west.

The foregoing considerations seem to render it probable that the aurora is essentially an electric discharge between the magnetic poles of the earth,—leaving the immediate vicinity of the north magnetic pole in the form of clouds of electrified matter which float southward through the atmosphere at a height of forty miles or more from the earth, sometimes to a distance of more than thirty degrees from the pole; that whilst they are thus moving forward with a comparatively slow and steady motion, or sometimes even remaining almost stationary for a long time, the bright streams of electricity are, from time to time suddenly shot out from them in a nearly vertical direction—that is to say in the magnetic curves corresponding to the points from which they originate; that these curves, ascending to a great height beyond the atmosphere, then bending more and more southward and downward until they finally reach corresponding points in the southern magnetic hemisphere, are the pathways by which they finally reach corresponding points in the southern magnetic hemisphere, are the pathways by which the electric currents pass to their destination; and for several hundred miles from the earth these curves are thus "traced through space in the most distinct way and illuminated with bright electric light"—and further that the magnetism of the earth also causes these luminous currents and the electrified matter composing the arch to revolve around the magnetic pole of the earth, giving them the motion from east to west or from west to east, which the streamers and the components of the arch are observed to have.—*American Journal*.

ON THE CAPACITY OF THE LUNGS.—Dr. Hutchinson, of England, in a recently published work on the vocal organs, asserts that the capacity of the lungs bears a uniform relation to the height of the individual, this conclusion being based upon experiments made upon 1,920 male subjects. The same authority asserts that the capacity of the lungs increases eight cubic inches for every inch above five feet. From the age of fifteen to thirty-five the vital capacity increases with the bodily development, and diminishes from thirty-five to sixty-five at the rate of about one cubic foot per annum.

VENTILATION AND HEALTH.—It was stated in a recent lecture before the Royal Institute, on the Relations of Town Architecture to Public Health, that bedroom air was an efficient cause of scrofula and consumption. Thirteen contagious diseases, producible at will, were enumerated and the lecturer stated his belief that, in time, epidemic diseases will be made subject to human control, and that the surest mode of protecting the dwellings of the rich was to cleanse and ventilate the tenements rented by the poor.

As daylight can be seen through very small holes, so little things will illustrate a person's character. Indeed, character consists in little acts, and honorably performed; daily life being the quarry from which we build it up, and rough hewn stones the habits that form it.

Accidents in the Mines.

There is hardly a day passes over our heads that we are not called upon to chronicle some sad disaster or mishap, that has occurred in the mining region of our state. With a population of several hundred thousand whose daily vocation is extracting the precious metal from the bowels of the earth, it is not at all surprising that many accidents should occur. But it does seem to us that a little more precaution to preserve life and limb should be taken by those who have chosen that laborious occupation to gain a livelihood.

Like in all other pursuits, where one is necessarily exposed to danger, the minor becomes so inured to the hardships of his calling that he becomes careless and indifferent as to himself, and to his own uncantiousness may not unfrequently be attributed the real cause of his misfortunes. Since the discovery of gold, hundreds of instances have occurred in our State, wherein healthy robust men have been suddenly ushered into the presence of their maker without a moments warning, at a time when the thoughts of death seemed farthest removed from their minds. In many instances, after the fatal accident has occurred, and the messenger of death has done its work, those who have narrowly escaped, and were permitted to survive their less fortunate comrades, can then look around them and see wherein a little care and expense would have preserved life and property. We are cognizant of instances too, when men have been long accustomed to blasting, perhaps engaged on works where they had the superintendence of a large gang of men for months at a time, and in their daily routine of business would become so reckless as to the safety of themselves, that they oftentimes thrust their persons into danger when it was wholly uncalled for. Although every man is presumed to know his own business best, and to be at all times competent and willing to shape his course in life in a way best suited to secure for himself and those around him the greatest amount of happiness. Yet we are mutually dependent upon each other, for our own happiness and success in life, and would oftentimes be far more prosperous and happy, and perhaps meet with fewer casualties, were we to pay more attention to the advice of friends, and the voice of reason, and less to that obstinate reckless course, which many persons are so prone to follow.

Mining is a business that should be carried on systematically, and requires perhaps as much care and attention, in order to be made profitable, as most any other kind of employment, and when men engage in it, they should do so understandingly, and provide accordingly to shield themselves from the many dangers and disadvantages to which they will necessarily be exposed, and not rush recklessly and illy equipped into a business of so much importance. When a course of this kind may not only prove unprofitable to them in a pecuniary point of view but be the means by which they may be deprived of their lives, at a time when they least expect it. A little wise counsel, and an expenditure of a small amount of money in a judicious matter, by those hardy sons who toil from day to day in our mines, would frequently save many a one of them from a premature grave and their dear ones who cluster around the family altar from a life of destitution and grief.—*Amador Ledger.*

SINGULAR PALLIATIVE FOR TOOTHACHE.—A little horse-radish scraped, and laid on the wrist of the side affected, will, in many cases, give speedy relief. A better way is to place a little serped horse radish in the month, or the tooth, or just round the gum. It relieves rheumatic pains in the gum and face also. The mouth may afterwards be rinsed with a little camphorated water, lukewarm.

CORN AS FUEL.—On a certain portion of the Illinois prairies, corn is being used as fuel instead of coal, and is found an excellent substitute. In the district referred to, corn is 13½ cents per bushel, and coal is 12 to 17 cents. Not only is the difference in price in favor of the corn, but a bushel of it gives more heat than a bushel of coal.

A cubic inch of gold is worth \$146; a cubic foot \$252,288; and in a cubic yard, \$6,811,776. The quantity of gold now in existence is estimated to be \$3,000,000, which welded into one mass, could be contained in a cube of 23 feet.

It is found that the prairie stone, existing in such large quantities just back of Chicago, will make gas as well as and as freely as the best coal, yielding fifty per cent. of pure saltpetre, and a residue be left of as good lime as can be found anywhere.

There are said to be 200,000 cats in London, that consume 52,000 horses, that are annually boiled down and served out by 1000 men, at a cost of £100,000. Yet the people ratify the expense on account of the destruction of rats.

Day, panting with heat, and laden with a thousand cares, toils onward like a beast of burden; but Night—calm, silent, holy—Night is a ministering angel that cools with its dewy breath the toil-heated brow; and, like the Roman sisterhood, stoops down to bathe the pilgrim's feet.

Lead and zinc are greatly expanded by heat—the latter metal expands nearly twice and a-half more than wrought iron under equal temperature.

The nearest of the brightest stars in the southern hemisphere is at twenty-one billions of miles distance, and its light will require three years and a quarter to reach us.

TO INVENTORS AND DISCOVERERS, MECHANICS AND MACHINISTS:

The undersigned, having had great Experience and Facilities for completing and carrying out all kinds of Improvements upon all kinds of Machinery and Implements, also preparing the requisite Drawings, Models, Drafts and Specifications, and is otherwise conversant with all principles in Mechanics of modern practice, and could prove, therefore, of invaluable aid to Inventors and Discoverers. Those contemplating bringing their inventions in a proper shape before the U. S. Patent Commission are particularly requested to consult the subscriber.

WILLIAM A. BURKE,
at A. Koller's Piano and Music House,
ap11 Sansome street, between Clay and Commercial, up stairs.

TO GOLD AND SILVER MINING COMPANIES.

The Pacific Metallurgical Works, North Beach,
Are now prepared to crush all kinds of Rock or Sulphurets, and of a suitable fineness for sale or reducing. For terms, etc., apply to
BRADSHAW & CO., Agents,
my17 Cor. of California and Sansome sts.

METALLURGICAL WORKS

For the Extraction of Gold from Sulphurets and Quartz Tailings.—A Mining Engineer, thoroughly acquainted with this business, practically and theoretically, offers his services to a responsible party with the necessary CASI, for the construction and superintendence of works of this nature. Further particulars at the office of the Press. ap19

VULCAN IRON WORKS CO.

P. TORQUET, MANAGER.

STEAM ENGINE BUILDERS, BOILER MAKERS, IRON FOUNDERS AND General Engineers, First street, near the Gas Works, San Francisco. Steamboat Machinery built and repaired; also, Saw, Flour and Quartz Mills, Pumping and Mining Machinery, etc.
The Vulcan Iron Works Co. invite the attention of Quartz Miners and others interested to their new style of Portable Dry Crushing Batteries with wrought iron framing. jc15

FIRE INSURANCE.

The undersigned offer insurance in the following well-known first-class companies, on the most favorable terms:
Hartford Fire Insurance Company, Hartford.
Phoenix Insurance Company, do.,
Merchants' Insurance Company, do.,
City Fire Insurance Company, do.,
Charter Oak Insurance Company, do.,
McLEAN & FOWLER, Agents.,
Office—North-east Corner of Clay and Battery Streets.
ap4

Jackson Street [Old Nos. 130, 132; New Nos. 429, 431].

Between Montgomery and Sansome Streets, San Francisco, Cal.

A. DURKIN & CO.,
MISSION STREET BREWERY,
Mission st., near Second, San Francisco, California,
THE FINEST ALE AND PORTER ON HAND.

HUNT'S
IMPROVED FIRST PREMIUM
WIND MILLS!

AN ASSORTMENT KEPT CONSTANTLY ON HAND AT THE MANUFACTORY,
Nos. 30 Second street, 208 & 201 Jessie street,
SAN FRANCISCO.

THIS WINDMILL WAS AWARDED THE FIRST PREMIUM AT THE MECHANICS' FAIR OF 1860, in San Francisco, for its great simplicity, strength and durability. It is easily controlled, and will be sold cheaper than any other Mill built. Further particulars in circulars.

The following committee awards the above premium: Devoe, Garratt & Ware; all of this city.
PRICES.—Eight feet wheel, \$50; Ten feet wheel, \$75; Twelve feet wheel \$100 to \$125 ap10 E. O. HUNT, Builder.

UNDERTAKING.—The undersigned would most respectfully inform their friends and the public that they have opened their
COFFIN WAREHOUSES
at 161 Sacramento street, below Kearny, and are ready at all times, night or day, to attend to every call in their line of business. Their stock is very complete, and will enable them to furnish every description of funeral, plain or costly, at the shortest notice.
All persons wishing to make interments in Lone Mountain Cemetery, can do so by applying to us at 161 Sacramento street.
MASSEY & YUNG.

SHAKSPEARE SALOON.

CHAS. DUVEHECK.

Billiards, Fine Liquors and Havana Cigars.

LYCEUM BUILDING,

Cor Montgomery and Washington streets.

CALIFORNIA LLOYD'S—MARINE INSURANCE.—Office, Southwest corner of Washington and Battery streets. The undersigned are prepared to issue Marine Insurance Policies, each being responsible for the sum written against his own name only, and for himself, and not for the others, or any of them.
JOHN PARROTT, JAMES DUNOUIE, GEO. C. JOHNSON,
WM. E. BARRON, N. LUNING, JAMES OTIS,
JAMES MCKEAN, JAMES B. RAGGIN, LAFAYETTE MAYNARD.
J. MORRIS.

LEWIS COFFEY & RISON'S

STEAM BOILER AND SHEET IRON WORKS.

The only exclusively Boiler Making Establishment on the Pacific Coast. Owned and conducted by Practical Boiler Makers. All orders for New Work or the repairing of Old Work, executed as ordered, and warranted as to quality.

Old Stand, corner of Bush and Market Streets.
Opposite Oriental Hotel, San Francisco, Cal.

LEWIS COFFEY, J. N. RISON.

A SPLENDID OPPORTUNITY.

AGRICULTURAL MACHINERY.

As I have taken, for five years, a large portion of the State Prison labor, for the sole purpose of manufacturing

AGRICULTURAL IMPLEMENTS AND CABINET WARE

I offer for sale, at a Great Sacrifice, in order to close out my present stock by September First, 1861, the following articles:

TWELVE HORSE STEAM THRESHING MACHINES.
C. M. RUSSELL'S EIGHT AND TEN HORSE THRESHING MACHINES.
J. A. PITT'S GENUINE MACHINES, FOUR, SIX, EIGHT, TEN AND TWELVE HORSE POWER, with all of C. M. Russell's Latest Improvements.
HAY PRESSES, REAPERS AND MOWERS.
EXTRA TRUCKS for Threshing Machines and WIRE TOOTH BUGGY HORSE RAKES.

All of the above goods will be sold at the Lowest Prices, either for Cash, or good approved paper at a low rate of interest.

THOS. OGG SHAW,
33 Sacramento Street.

PACIFIC MAIL STEAMSHIP COMPANY'S line to PANAMA connecting via Panama Railroad with the steamers of the Atlantic and Pacific Steamship Company, at Aspinwall.

FOR PANAMA,

DEPARTURE FROM FOLSOM STREET WHARF.

UNCLE SAM.

— HODSON.....Commander.

Will leave Folsom Street Wharf, with Passengers and Treasure, for Panama THURSDAY.....July 11, 1861,

AT 9 O'CLOCK, A. M., PUNCTUALLY.

And connect, via Panama Railroad, at Aspinwall, with steamships for N. York For freight or passage, apply to

FORBES & BABCOCK, Agents,
Corner of Sacramento and Leidesdorff sts.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved
AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz.

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,
J. B. BEERS
Ma15 165 Clay street,

CALIFORNIA COAL MINING COMPANY.

CAPITAL, \$5,000,000

IN 50,000 SHARES.

THE BOARD OF DIRECTORS and Trustees of the California Coal Mining Company, give notice to all parties disposed to invest in the Stock of the Company, that Ten Thousand Shares, of \$100 each, of the said Stock are reserved for that Purpose, by resolution of the Board.

The Books of Subscription are open at the office of Piche & Bayerque, where the required first instalment of 10 per cent. will be received.

F. L. A. POCHE, President.

m28 J. H. APPLEGATE, Secretary.

AGENCY FOR PATENTS.—The undersigned having been long established in the Patent Agency Business, and having favorable arrangements for attending to the interests of Inventors at the Patent Office in Washington, offer their services for the securing of Caveats and Patents also, will attend to the sales of Patent Rights, and to all matters connected with patented inventions.

WETHERED & TIFFANY,
Office, Market street opposite Montgomery

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY JULY 6, 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 19 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

AN APOLOGY.

The editorial articles prepared for this number of the MINING AND SCIENTIFIC PRESS, are still on the "copy hook"—all our printers having spent the Fourth most gloriously. They are not quite through with it yet! We like patriotism, and willingly excuse them. Our readers will doubtless do the same.

EARTHQUAKE.—At ten minutes past four o'clock, P. M., on Wednesday, the 3rd inst., a severe shock of an earthquake was experienced in this city. It commenced gently for about three seconds, gradually increasing in vigor and rapidity of motion until it seemed as though the houses might be shaken down about our citizens ears. The heavy shock lasted about fifteen seconds, but gradually subsided until the tremulous motion could scarcely be distinguished. Two more major shocks were felt at intervals—the entire shaking lasting fully 30 seconds. The motion was wavy, from N. E. to S. W. It was felt in Contra Costa ten minutes before in this city—so that the earthquake wave traveled very slowly. Fortunately no damage was done.

OPINIONS OF THE PRESS.—We have recently received from contemporaries several flattering notices, for which we feel grateful, and can only respond, that as our paper grows older, it shall grow better in every respect. The Oregon Farmer of June 1st says:

"We take occasion here to say to all scientific men, inventors and persons engaged in mining, that the San Francisco MINING AND SCIENTIFIC PRESS is one of the most valuable publications of the day."

The Daily Mirror, of July 4th, uses the following language, which, coming from so authoritative a source, we consider especially complimentary:

"Our weekly cotemporary, the MINING AND SCIENTIFIC PRESS, has one department which those who are interested in mining affairs should peruse if they desire to keep themselves thoroughly posted in all that is transpiring in that field of enterprise. It contains a carefully digested record of the business of the mines, and offers a source from which may be derived some idea of the wonderful development which is now taking place in the mineral riches of the State. If it were not for some such exhibit as this, we should often be led to suppose that the mines are giving out, so little attention is paid them by the papers generally."

The Nevada National of last week, says:

"We have had the pleasure the past week, of making the acquaintance of Chas. F. Secor, Esq., an attaché of the MINING AND SCIENTIFIC PRESS, one of the most valuable publications in the State. The Press is issued weekly, at San Francisco, by J. Silversmith, Esq., for \$4 per annum. Mr. S. is now making the tour of the State, as a mining correspondent, and for the purpose of extending the circulation of the paper."

THE PRESS APPRECIATED.—We observe the Republicans have set a most creditable example, which other Conventions to be held, might follow with a great deal of advantage and profit—they have placed the names of three editors on the ticket.—*Spirit of the Times.*

Four, brother Boruck, four—viz: Sargent, formerly editor of the Nevada Journal, Pixley, of the S. F. Times, Fargo, of the Alameda Herald, and Avery, of the Marysville Appeal.

BLACK DIAMONDS.—Supervisor Gaven has sold his interest in the New York Ranch (which covers the California Coal Mining Co's. Mine) to Mr. Pioche, for \$35,000. A few months ago he would have accepted \$6,000 for it.

ANOTHER RAILROAD.—The Supervisors of Sacramento City have granted permission to the State Agricultural Society to build a temporary Railroad from Front street (the levee) to the Pavillion and Race Track, where the cattle show will take place.

HOPS.—Mr. Bixee, of Matelot Gulch, Tuolumne county, has been cultivating hop vines for some three years, and it is affirmed that he will have a bountiful crop this season.

From our Special Traveling Correspondent.
LETTER FROM GRASS VALLEY.

GRASS VALLEY, JUNE 26th, 1861.

EDITOR MINING AND SCIENTIFIC PRESS:—I have walked through and around this pleasantest of mountain towns, and find every evidence of substantial and enduring prosperity around on every side. In the town itself numerous brick buildings—stores and dwellings—are going up, while in the outskirts I saw many pretty cottages in process of erection. This is by all odds the liveliest and most agreeable of all interior towns that I have visited—it's people are genial and hospitable—its society is good—its climate salubrious—its soil is wealthy in agricultural as well as mineral productions—its aspect inviting in nearly every respect. As I stood on the ridge-road leading to Nevada, to-day, I could not help sorrowing that Pike Flat, which lay stretched out to the left of the town, should have been so torn up. Once the glittering gold lay buried beneath its verdant bosom, (hence named Grass Valley), but the ruthless pick and shovel have disemboweled it and Pike Flat looks like the skeleton of its former self. But for the bare "bed rock," heaps of boulders, and gaping holes about Grass Valley, it would indeed seem like an enehanted spot. The mines here are, on an average, paying well, with prospects of doing better.

I have been down to Boston Ravine and on Massachusetts Hill—a mere flying visit though. On my way I visited the Gold Hill Mill and ascertained that it is working with its usual success. The Massachusetts Quartz Mill works steadily along—the lode continuing to pay as well if not better than heretofore. In the latter are employed 130 men. The Mill reduces from 125 to 150 tons of quartzose rock per week. From 2500 tons of rock recently crushed, nearly \$20,000 worth of gold was extracted and sent to San Francisco—an average, you see, of \$80 to the ton; on my way back, I noticed the picturesque cottage where Lola Montez once lived. Alas! poor Lola! it is hard to realize that she who was once the brilliant cynosure of all eyes at the Bavarian Court—who had danced with dukes, princes and kings—counted among her harem, when temporarily sojourning at Venice, none but young counts—and who infatuated the half of Europe; I say it is hard to make oneself believe that she—the vivacious, sparkling, facile conversationalist,—"divine Lola"—could have died miserably on a little straw, in the corner of a chilly New York garret! But I must finish my epistle, as I desire to hunt up further particulars of this interesting place.

MINT OPERATIONS FOR THE YEAR.—The U. S. branch Mint, has coined, during the fiscal year ending June 30th, \$12,421,000 in gold, of which \$12,286,000 were in \$20 pieces or double eagles; \$60,000 in \$10 pieces, or eagles; \$40,000 in \$5 pieces, or half eagles, and \$35,000 in \$2 50 pieces or quarter eagles, there being no three dollar or one dollar pieces struck. During the year, 234 purchases of silver bullion, amounting to \$187,721 69, were made, the major portion of which came from Washoe. In this silver \$52,590 20 in gold was found. The silver coinage amounted to \$269,485 61, of which \$175,000 were in half dollars, \$13,000 in quarter dollars, \$10,000 in dimes, and \$71,481 61 were run off in refined bars. The total number of gold deposits was 5,644, an average of 470 a month, the aggregate value of which was \$12,269,104 23. The fineness of the gold deposits vary considerably, in June running up to an average of 991, whilst in January and March it ran down to 880. During July, August, September, October, November, May and June, most of the deposits were of bars which had been refined at private refineries. The largest number of deposits made in any one month was in May, the number amounting to 1050, with an aggregate value of \$2,840,000; in November the number was 297, and in October the value was \$408,000. The whole weight of metal after the first melting, is set at 26 tons, troy, which was increased over five thousand ounces by the alloy allowable for standard coin.

SINGULAR ACCIDENT.—A mother in La Porte, while playing with her child, about a year old, attempted to lift it by its leg, when the bone of the limb snapped in two. This is a sad occurrence for the parent and should serve as a caution to all others.—*Messenger.*

FIGS.—A Butte exchange mentions, that ripe figs over seven inches in circumference, were gathered last week from the garden of Judge Wells, in Oroville.

SCARCITY OF SILVER.—Silver change seems to be quite scarce in our mountain towns, greatly to the annoyance of the mercantile community of the interior.

MINERS WANTED.—In Amador county, a number of good workmen can procure steady employment at the quartz mines in the vicinity of Sutter Creek.

MORTALITY.—The number of miners killed in their claims, in California, will average about one per day.

A TRIP THROUGH SOUTHERN OREGON.

BY PHILIP RITZ.

Last winter I was traveling south of Glen Run, Benton county, Oregon, as far as Siskiyou county California, and I have penned a few recollections as they occur to me:

From this place (Glen Run) to the Calapooia mountains, there is but little of interest at the present time. The country is in a state of bankruptcy. There is no cash offered for any kind of farm produce excepting a small amount of oats and hay at the stage stations.

Eugene City, 40 miles south, is a neat, pretty, little town on the west bank of the river, has a splendid water power, and a district school that is scarcely excelled in the state; I think it perhaps excels our Corvallis College.

The stage route up the coast fork is naturally a good road, but the route over the Calapooia mountains is perfectly awful. There is a route through the mountains down what is called Pass creek, that can be made a splendid road. There are no hills on it, it is even difficult to tell where the summit is. It is certainly a natural pass for a railroad. What appeared strange to me was that there has been no more travel on it.—Often as I have crossed the mountains, I never heard of it before.

Oakland, 50 miles south of Eugene City, on the Calapooia creek, is a thriving little village, surrounded by one of the best tracts of farming land in Umpqua valley. There is a good flouring mill, and they have been doing something in the way of bacon. Messrs. Lord, Peters & Co., the principal merchants, have cured 100,000 pounds this season. The Umpqua salt works are near this place, where a superior article of salt is manufactured and sold at the works for 3 cents per pound. There is also near this place a sandstone quarry, where is made an excellent article of grind or whet stones, equal, it is said, to the very best imported.

The Umpqua Valley, I consider about the best fruit country on the Pacific coast. Peaches and grapes can be raised here to perfection, and the Lawton blackberry and other small fruits can be carried in quantities to supply all the country south until their orchards get old enough to bear. I sold dried peaches at Yreka for 45 cents per lb. They can be raised profitably in the Umpqua for 15 cts. Pears will pay even better to dry than peaches.

Roseburg, 16 miles further south, is an enterprising little place, with a good water power and a good flouring mill. They say they can bring the South Umpqua into town which will afford an unlimited power. When I went south they were talking considerable about the enterprise, and of building a good woolen factory,—the very thing that the Umpqua Valley needs. When I returned two months afterwards, it was entirely given up. They found it was impossible to get sufficient capital without paying the ruinous three per cent., and they very prudently gave it up. Thus Umpqua Valley, one of the best sheep-raising countries in the world, drags along, selling their wool at a great disadvantage, and buying woolen fabrics at an enormous price, which by all means should be made at home, all because this cursed three per cent., is tolerated in this country.

The Canon, 25 miles further south, is pretty well improved, so as to be quite passable, but there ought to be a first rate plank road through it for the amount of money expended on it. I have been informed that not less than \$100,000 has been expended there.

From the Canon to Rogue River there is less improvements and less land under cultivation, than there was before the Indian war, six years ago.

Up the Rogue river there are some good farms in a creditable state of cultivation; and at Rock Point is a good toll bridge. At the Dardanelles there is a good steam quartz crusher, that was put up to crush the quartz from Gold Hill. It cost \$12,000, and is now idle, after crushing out \$120,000 of the precious stuff. It is interesting to see the vast pile of ground quartz that has been washed out. One of the proprietors told me there was considerable gold in it yet. I remarked that it would make a most splendid article of glass. "Yes," said one of the gentlemen, "if we did not have a much cheaper article right at hand." He then told me of a great quantity of a substance up on Gold Hill that he mistook for iron ore, when on melting some of it he found it to be pure glass without adding any further ingredient. He said it made a coarse article of glass ware but would be splendid for fruit jars, &c. He also told me of a clay on the same mountain that intelligent Chinese told him would make the purest quality of china ware. So tenacious is it that on working it between the thumb and finger it could be worked so thin as to become nearly transparent. The manufacture of these articles I should think could be made quite profitable, and of great advantage to Southern Oregon and Northern California, where freight and insurance are so very high on such articles.

PRaisEWORTHY ENTERPRISE.—From the Courier, we learn that the citizens of Columbia, Tuolumne county, are endeavoring to found a botanical garden in that city. We should have one here, by all means.

ARTESIAN WELL.—We learn that a second artesian well has been bored at Pacheco immediately upon the Fair Grounds of our county Agricultural Society, and that a stream of pure, soft water issues therefrom, rising to a height of five feet in a tube.—*Contra Costa Gazette.*

SUMMARY OF MINING NEWS.

CALIFORNIA.

MONO COUNTY.—A correspondent of the Mariposa Gazette, writes from Aurora thus:—There is no mistake about the richness and extensiveness of the silver leads in this (Esmeralda) District. There is considerable work being done in a way of developing ledges—such as sinking shafts, running tunnels, etc. Contracts are taken on all manner of conditions—sometimes solely for "fret" in the ledge. In some cases men taking such contracts, are enabled to lay back their oars on the aristocratic consciousness of "fret" in the claims, or can sell out at a nice figure. There are in all probability over five hundred gold and silver leads in this district. About twelve hundred men and perhaps twenty women. About half of them, the ledges of course, are driving shafts sink or tunnels run into them, and the deeper they sink on them, the better the prospects are—"just like picking honey out of a rag." When our mines are a little further developed, which will be a few months hence, we will exhibit to the world such vast bodies of precious metals, that a large portion of it will be attracted hither to work and invest in our beautiful hills, which are covered with gigantic forests of aromatic sage brush and scrubby oaks, with silver leads every fifty feet, and any amount of rich boulders scattered promiscuously around. The boulders are being gathered by "boulder companies,"—so called by putting them in piles and numbering them, etc. These companies will, probably make very well of them, as the boulders are but little trouble or expense to collect, and will pay from one to five hundred dollars per ton. One mill will be ready to crush rock in about a week; a few others are on the way hither; but there will probably not more than five or six in operation this summer. We need quartz mills now. Miners owning ledges here, are not generally able to buy machinery to work them, but they offer dollars per ton to have the quartz crushed. * * * * * The Esmeralda Company, in the Esmeralda District, have struck their lead after running 180 feet. The lead is well defined, and the owners of it say that it will compare favorably with any lead in Virginia city. * * * * * The Territorial Enterprise of June 29th, says: We last week alluded to a yield obtained from some rock at Esmeralda, which we thought sounded rather largely. Since then we have positive information that Green, at his mill there, realized from a ton and a quarter tons of boulders, fifteen pounds of gold. The value is not yet determined, but it is supposed to be worth about \$10,000. Messrs. Smith & Goodshaw lately sold 37 feet in their claim at Gold Hill, at the rate of \$700 per foot.

TULARE COUNTY.—The Visalia Delta says that a train of live animals and a wagon arrived Sunday last, bringing a large quantity of rich ore from Russ district. We are informed, by parties upon whose experience and good judgment we can rely, that the discoveries in the Russ district exceed in extent all the mines hitherto found in Washoe or Esmeralda, and it is believed by parties who have visited both the places, that there is more ore above the level of the pond, in the "Union Lode," than in all the mines of Washoe and Esmeralda combined. This District is situated at the Myo mountains, east side of Owen's River, and about miles north of "Owen's Great Lake." The Union lode is probably the most remarkable in the District—it rises to a height of 2,000 feet perpendicular in a distance of 4,000 feet, and is easily traced for eight miles by its outcroppings. The rough assays of the Union ore made on the spot—produces \$179 80, per ton of silver, to which must be added gold—which is apparently liberally diffused throughout the quartz. The Union Co., are pursuing the proper course they have no property for sale—they know that their ore is rich and intend to dispose only of sufficient to produce substantial machinery, for the most perfect development of these extensive mines. We are informed by the Recorder of the District that already nineteen miles of veins or lodes, have been recorded, and from this fact, we cannot but pronounce this the most extensive District yet discovered. * * * * * The Eureka Silver Mining Co. has, during the present week, filed its certificate of incorporation in the County Clerk's office. Its object is to mine gold and silver in Washington District, Tulare county, California. The capital stock of the company is \$1,200,000, in 1,200 shares of \$1,000. The trustees of the company are five in number, and until the first annual election in October next, will be E. S. Gross, Isador Burns, P. J. Gilford, H. H. Hays, and E. J. Wilber. The corporations are E. S. Gross, E. J. Wilber and W. Porter.

COLAVAR COUNTY.—The Stockton Argus says: Our Lovee is made a place of temporary storage for several hundred tons of ore from Copperopolis, waiting shipment to San Francisco. The quantity is every day increased by new arrivals. We are informed by a gentleman who arrived in the city yesterday from the copper region, that the excitement over the recent rich discoveries at Dog Hill has become intense, and hundreds of people are hunting for them, making new discoveries almost daily. It is becoming apparent that should the receipts of ore in this city continue as during the past week, it will be necessary to secure other places for its deposit than the wharf, or its immense weight will soon lay waste us without a landing. * * * * * There is nothing particularly new about the copper diggings since our last issues. The independent says: At this moment all our diggings since pale before the copper main; literally, every man you meet is like "pockets full of rocks," and acids to digest them. All our fluctuating population tends towards the western side of the Bear Mountains. Copperopolis is becoming the centre of business and rapidly advancing in population and wealth. A month ago it contained a frame house or two, a blacksmith shop, and a large canvas tent store; all else was in the woods. Now we have a lot of boys sold in the town limits at prices ranging from \$55 to \$600. They will soon have under way a first-class hotel, billiard saloons, stores of all the necessaries of a thriving mining camp. Six miles below in the neighborhood of Dog Hill and Shafter's store, things are advancing with the same amazing rapidity. In every direction the prospectors are striking new veins of mineral, and all seem to be confident that their new discoveries

are rich and valuable. We have seen specimens of ore from many of these claims, and they really look as favorable for permanent and profitable mines as the specimens which came from Copperopolis. Developments on several of these new veins have been made as far to the northward as the Mokelumne river, and the excitement is now almost as much in evidence in the vicinity of Colusa, S. F., as it was in the vicinity of Spring Valley, as it was in the districts where the first discoveries were made. The entire country west of Bear Mountain to the Plains, seems to be "explored," and will doubtless, in the course of a few months, be as crowded with mining adventurers as the canons and gorges on the side of the Mountains were during the first times of gold mining operations.

AMADOR COUNTY.—The Ledger learns from Mr. V. Stacy, of Volcano, that the cleaned up amalgam of the amount of \$700, the result of one week's washing at the small mill of Judge Fiske, near Tullock and Stacy's lead. The rock amounting to about 25 tons, was taken from the above lead. They divide their quartz as fast as it is taken out. Mr. Tullock crushed his share at his own mill, and Mr. Stacy crushed his at the one above mentioned. The miners in the vicinity of Volcano, are doing remarkably well. One company of four men, whose claims are located in the south branch, washed up last week one thousand and fifty dollars. On Madaba Flat and vicinity, an abundance of water for mining purposes, can be had at reasonable rates, and the claims are all said to be paying good wages. An Italian company, says the Dispatch, have elaborated and recorded 10,000 feet of Jackson Creek for mining purposes. Their claims commenced at the first canon below town, and extends to Kelly's place on the middle fork of Jackson, or nearly two miles. A lode has been commenced at the lower end, and laid down one thousand feet. It will be extended the length of the claims. In proof that the diggings at Idaho City "are not worked out," Idaho Valley picked up a piece in his claim the other day of three ounces and a quarter.

LOS ANGELES COUNTY.—Says the Los Angeles News: In February a party of men left here for the purpose of exploring the country lying on the head waters of the Gila river, and to prospect for minerals. Mr. Samuel Thew, who was one of the party, informs us that their researches were attended with but little success, though the country through which they passed abounds in mineral wealth. For the want of competent and experienced guides, and a fresh supply of provisions and more animals, they were unable to pursue their examination to the extent contemplated, and were prevented from reaching the headwaters of the Gila river, which they were told by the Indians were a continuous trail of mineral veins. The party brought in quite a number of specimens, comprising a variety of those found, which seem to be very rich in silver, copper, etc. They went as far as the Santa Maria, where they were visited by Indians who told them that in four days (sloops) in a N. E. direction, there was plenty of gold. We are assured by Mr. Dwona, who is an experienced miner, that he has not seen a locality in California, which abounds so numerously in mineral indications as the region in which their party traveled. The prevailing opinion with many is, that in that region lie the mysteries of the "silver bullet."

SISKIYOU COUNTY.—Copper writes from Klamath river to the Yreka Journal, that there are not exceeding 25 miners at work between Hardburg and Fort Goff. Some of these are making good wages, but the majority, as is usually the case in most other mining localities, are making but little more than "grab" expenses. The character of the Klamath mines is what miners term "spotted," which, I have ascertained by practical experience, means several acres of ground that don't pay to a yard that does. I was present in a mining claim, fronting two miles on the river, and extending back to the Oregon line, which I am anxious to sell for cash at government price, and I will guarantee that all the gold, silver and precious stones that ever were in it, are in it yet. The Union says that the upper Hardburg Company took out of their claim on McAdams Creek, on Wednesday last, the nice sum of thirty ounces of gold dust. Their claim is one of the richest in the country. The claims generally on McAdams Creek are paying well. The miners on Deadwood Creek have just commenced washing up, and the results are very flattering to the McAdams, and other mining companies in the Creek, think they will be able to report rich yields during the week.

SIERRA COUNTY.—Correspondence to the Democrat from the town of Excelsior, informs us that the diggings there are all paying well. The Dead Brook had last week 95 ozs., and only worked a small force, as they were repairing their main tunnel. The St. Lawrence had fifty ozs., working only two cars. In a few weeks more they expect to strike the main channel, when they will astonish the miners of California with some big yields. During the past week the Dead Brook mill has cleaned up 300 ozs., the Independence 413 ozs. Other companies in the vicinity are doing well. The old mining camp of Port Wino, has taken a great start in the past two years. It had run down at the heels most shockingly, and was thought to be on its last legs; but to-day it is livelier, better looking, and with brighter prospects than ever before.

PLUMAS COUNTY.—A correspondent writes to the Democrat from Tulelake, that the following amounts have been taken out there during the past week: Thomas Mullen, 43 ozs.; Vulcan Co., 19 ozs.; Chaparral Co., 50 ozs.; Red Rock, 80 ozs.; H. Bliss & Co., 170 ozs.; Funks Co., 49 ozs.; Last Chance 45 ozs.; J. Smith, 200 ozs., besides small lots too numerous to mention.

HUMBOLDT COUNTY.—Mr. Geo. Flower informs the Humboldt Times that a rich quartz lode has been discovered near Pony Creek, a tributary of New River, by Mr. John N. Reed. Specimens from the ledge yield largely in gold.

NEVADA COUNTY.—At North Bloomfield, quite a number of claims that are being worked are paying well. Jacobs & Co., after a two day's run, last week, cleaned up \$700. The weather is truly delightful, and all kinds of crops are growing luxuriantly. A blast of twenty kegs of powder was sent off at the Golden Gate Tunnel, near the New River diggings. It was afterwards found that two workmen, Francis Jones and A. Schuller, had not made their exit with the others, and that they had been killed with the blast.

TRINITY COUNTY.—We saw at Greenhook & Newbarn's the other day, says the Journal, four specimens from the claim of Cone & Fonke, miners on one of the Forks of Pony Creek. The largest weighed about ten ounces, the smallest half an ounce. Notwithstanding the New River diggings are generally rich, there are few claims where it is picked up in chunks as yet.

A company of workers at Canon Creek, have struck diggings, from which they have obtained as high as from \$50 to \$75 per pan.

TUOLUMNE COUNTY.—The Courier says: The mines and miners are doing above a fair business in this district, although quite a number of the claims are short handed, owing to the drain of miners setting so strongly towards the new fields of Copperopolis and Esmeralda. Water is abundant here and the weather fine.

SAN BERNARDINO COUNTY.—F. Mellen recently obtained in this city, machinery for quartz crushing. He intends to erect a mill at Holcomb Valley, in San Bernardino county. It is of twenty five horse power, and the boiler weighs 6,000 pounds.

STANISLAUS COUNTY.—The hills in the neighborhood of Knight's Ferry are covered with copper hunters. A rich vein was discovered within a mile of that town.

NEVADA TERRITORY.

The Silver City Times has just received information concerning the Silver Hill mines, situated about one hundred miles in a north-easterly direction from Silver City. About fifty ledges have been already located, and though the country has been pretty thoroughly prospected, our informant is confident that many more will be discovered in a short time. The ledges are generally large and well defined, there being a great similarity of the ore to the veins. There are some resemblances to the New River diggings, and some to the American mines, in which country the ore is smelted in rude furnaces by the miners themselves, thereby doing away with the necessity for a large outlay of capital, by way of mills, in working the mines. Beautiful stone coal has been discovered about six miles to the northward, and probably in abundance, as the country is in a great measure of a slate formation. Wood is abundant, but water for mining purposes scarce. The ore dollars are being sent, by assay, from the country to the hands of the miners. Quite an emigration has already taken place to these mines, and they are apparently well worthy of it. . . . The Call says that Harold Neumann & Co. have, within the past two months, brought to this city, from their claim near Virginia City, nine thousand pounds of bullion, worth three dollars per ounce. On Saturday they received nine hundred pounds, worth three dollars and fifty cents per ounce. One year ago these mines were absolutely steeped in poverty. We are credibly informed that Wolk, Fargo & Co. freight fifteen hundred pounds of bullion a day from

Washoe. That rough country will prove of some benefit yet. . . . The Hazel Green Tunnel Company, who have been running to strike the Galena, Hines and Turkey ledges, on Ophir Hill, have struck a ledge of great width, and apparently as rich as the Ophir or any other level of the range.

CENTRAL AMERICA.

From the Panama Star & Herald we learn that a company of Californians had arrived at Panama from San Francisco, on the Orizaba, for the purpose of working the mines in Nicaragua. They were to leave for the new diggings in a few days. They were well provided with provisions and mining implements.

MEXICO.

MATZLAN.—A letter from Matzlan, June 21st, to the Bulletin, says: I am satisfied that there is a rich gold-bearing region within a circle of three hundred miles of this coast. As to other minerals, there are plenty of rich salts than any of the newly-discovered mining regions on the eastern slope of the Sierra Nevada. There are at present but very few Americans in Matzlan who know anything of mining or prospecting. Another writer says Messrs. Caswell & Turnbull saw at Copala gold placers, and several Mexicans at work in a ravine, washing with batons and a rudely constructed rocker. They were making \$3 or \$4 per diem to the man, working four or five hours in the day. The gold is coarse and mixed with silver. The field is about 25 miles square, and would give employment to 2000 men. Water is abundant, and good wages can be had with sluices or by the hydraulic process.

OREGON AND WASHINGTON.

A letter in the Mirror dated June 28th, says: I wish you could see all the letters from the mines that have been published here. I have been of the opinion all the time that the reports from the diggings was much exaggerated, but now it is a settled fact that the mines are both rich and extensive. Julius Baldwin came down from the mines last night. He says they are paying extremely well—equal to those of California in '49. Men writing to their wives from the mines, and whom they would not deceive, say the mines are doing well—sixteen dollars a day, and at some points as much as from twenty to one hundred dollars a day. One of our friends, McMillan says they will last twenty years, and grow better for ten years to come. If you could see the vast quantity of goods going up the river daily you would think there was something attractive up there. . . . The Oregonian of the 19th June gives the following letter from Nez Perce mines, at the same time stating: We will vouch for every word stated in the letter of Mr. Reese, on the first page of this paper. There is gold in the mines and their richness is equal to that of California—these mines will ere long pour wealth into the lap of Oregon.

FRIEND BOYAKIN.—I promised you when starting, that after arriving in the mines I would write what information I could command—confining myself strictly to facts and the truth. It is a difficult matter to find out what men please out per day. One man may tell you he is making fifty dollars a day, when he is making eight dollars; and another who may be making fifty will tell you that he is making fifty dollars a day, and is actually making six dollars. You might reasonably expect better things. Now, if a friend should ask me how my claim paid, I would give him my average wages per day—not the wages, but information. If I were making five dollars a day, and should tell a friend fifty, I would not expect to make fifty the next day in order to make the lie a truth. Of course it is not my business what another man is making; but as long as everybody makes it his business to ask such questions, it is his business to give the information. If you can, but I don't think it will be one of the kind that can get it. The few men who are making good, are making generally, I can only surmise. It is a settled fact, however, that claims that are opened and being worked, pay from five to fifty dollars a day to the hand. But it must be borne in mind that persons who come hereafter will have to run their chances of finding claims, as all the ground here is occupied, and some of it will never pay working. The great excitement now is, that the rich diggings have been found on a stream emptying into the South Fork of the Snake river, and called after the name of the pan, and bed rock pitching. This I regard as true; but it is coarse gold, and the diggings probably spotted. For my own part, if I am not taken off in the whirlwind of excitement, I expect to stay right here where I am at present writing, for the next two years to come. I am situated with three others in company, on Oro Fino creek, two miles below Pierce city. As an indication that we will stay here awhile, since my arrival we have put up a comfortable house of six hundred feet square, and a good road, and a ditch half a mile in length. We expect to commence shoring out in a day or two. Our claims prospect from one to fifteen cents to the pan. Yours truly, S. G. Reese. . . . The Oregon Farmer talks in the following sensible manner of the Nez Perce mines: Notwithstanding all that has been said and written, the probabilities of these mines has not been determined with entire certainty. We have no great reports in letters from the mines. Men write that persons there are making fifty dollars and one hundred dollars a day, and even more a day in their claims; and of vastly rich claims being discovered, and of the rush of people to them. Our greatest and most wonderful news comes from men who have just arrived at the mines, and whose ears are filled with great statements, great yields of gold, great everything. Now, has a single man written a letter who has and continues to make two hundred dollars, one hundred dollars, fifty dollars, twenty-five dollars, or even ten dollars a day? I suppose they do, but I suppose they have made such statements, but we doubt whether such a one has been written or read. At the same time we do believe that gold has been found at the Nez Perce mines—perhaps some miners have made good strikes—but the masses who have rushed probably have not realized four dollars a day. And many, indeed, have not made half that. Mr. Hall tells us that he was in the mines for many weeks; that there were spots in which gold was found in paying quantities; but that everywhere else it was only a few dollars the case. Mr. Hall is expected about for fifteen days, with experienced Californians and was unable to obtain more than two dollars and fifty cents a day. He knew a claim said to be a good one, and two days work on it only realized two dollars and fifty cents. We believe that the Nez Perce are like the Colville, Rock Creek, and Wenatchee mines—all will pay with hard untried industry. Men who will not practice in this system will fail in the Nez Perce and all other mines. We doubt not from this that the great mass of gold can be found in the rough and the ranges of the Rocky Mountains. Discoveries will be constantly made, and when men will settle down on many have done, on Rocky Creek, and pursue the mining business with skill and industry, they will make a reasonable amount of money. We are glad to see the experienced miners of California go up to the mines. Some eighty went by Monday's boat. After these miners and others of the same class go to work, the people of this section of the country will realize the advantages of these mines. Others will be disgusted and come home, where we hope they will engage in farming and other branches of industry, more suitable to their tastes and habits.

BRITISH COLUMBIA.

From the Colonist we learn that the work of sinking a shaft for a new seam of coal is progressing. This seam is connected with the Bristow lead, and is said to be of a superior to any before struck. Workmen are busily employed in the pits getting out coal for the fall trade. New buildings are springing up every day at Nanaimo, and the population is increasing very fast. . . . Considerable excitement exists at Nanaimo in consequence of the reports recently brought from the Comox country, by parties who have recently been thither to take up land. They represent the land there to be better adapted for farming and grazing than any of the districts of the coast. In consequence of this, the Comox and Salt Spring Cowichan is improving very rapidly, and has received numerous accessions to its population this season. . . . The Victoria Press of June 25th, says that the intelligence from the Great Northern Dorado, so far as mining prospects are concerned, is remarkably encouraging, but a probable scarcity of provisions and almost famine prices is creating uneasiness among the numerous class of miners with limited means. It is rumored that some of the miners have left the Dorado for other mining localities until provisions become more plentiful. . . . There are no accounts of late big strikes about Antler, as the weather has been remarkably unfavorable for prospecting. The spring has been very backward, the old snow remaining in the gulches until very late, and new accessions were made to it up till May. Latest advices, however, state that it had almost disappeared, and that numbers of miners had made one trip from the Forges to Antler, a distance of twenty miles, and were going up a second time with provisions for active mining operations. The Chikatanas are said to have considerable money, the proceeds of their winter and spring work on the river. The high water has driven them out, and the white miners on the Carriho will not allow them to obtain a footing in the new diggings at present.

MODES OF PLACER MINING.*

The Board Sluice.

(Continued from our last.)

We will now take up the iron plating, which for convenience should be made movable, and prepare the coppers for use. Then set the box; take a small portion of your nitric acid; mix it half and half with water; then take a rag, or sponge, or whatever may come handy, and wash the exposed surface of the copper. Having done this, take a little of your silver, drop it on, and rub your plate thoroughly till it is all perfectly silvered. Now set your sluice at the same grade as the others, but drop it so as to bring the iron plating on a level with the one above. It will be seen at a glance that the larger and heavier material rushing down the sluices will easily glide off, and allow the finer particles of gold—which by this time have gained the bottom—and other fine substances to descend, with a portion of water, through the openings on to the coppers below. If possible, let a small stream of fresh water in at the head of the coppers, but be careful not to have too much. This will thin the material coming through, and allow the gold to be more readily caught. You want a riffle below your coppers, to catch whatever quicksilver may run off of them by overcharging. Your coppers at first will turn green, but no matter; every morning, for the first two days, rub it off, and put more silver on. As gold collects, this green will disappear.

It is best not to touch the plates until you are through your working, unless, as I said before, they become dirty—too heavily charged, and the gold is unsafe to leave. It is an attested fact, well understood by all workers in gold, that nothing catches it and returns it better than amalgam.

Sometimes transverse blocks of wood are used for riffles. They are cut across the grain, from two to four inches deep along the grain, and as wide as the sluice. These blocks are wedged into the sluice boxes, with transverse spaces of an inch or two between them.

Another device is, to fill the pores of such blocks with quicksilver. This is done with an iron cylinder, with a sharp edge, which is driven into the block a little way and then the quicksilver is forced down through the cylinder into the wood.

Some dirt (called cement) is so tough that it cannot be dissolved by running once through a sluice, nor even by running through twice; so they save the tailings, and after leaving them exposed to the air for a while, wash them—in all, three times. The third time completely dissolves the hardest dirt.

The Rock Sluice.

The rock sluice, or cobble-stone bottom, is the best of all in places where it can be used to advantage. It wants a steep grade, a large body of water, and a wide sluice box. Mr. B. P. Avery wrote thus of the rock sluice for the San Juan Press:

"One of the latest improvements in mining is the introduction of the rock sluice. The hydraulic power, well directed, tears down and washes off the auriferous earth with all the power and effect of natural forces directed by reason; while the blocks and riffles lining the sluice boxes, through which the dissolved dirt is conveyed, are only cunning substitutes for the gravel beds of natural water courses. These same gravel beds are now more closely imitated by lining the bottoms with cobble-stones, lapped one over another in regular layers, and inclining down stream. This idea was crudely adopted several years ago, rocks being piled irregularly in the sluices, and there allowed to remain for an indefinite time.

The plan, now, is so systematized as to be really valuable. Every section of sluice, or each box fourteen feet long, is regularly paved as above described, the stones being laid down by nailing strips of board, five and a half inches wide, on each side of the box, and wedging a cross-piece under these strips at the end of each box. As soon as the dirt and water have been allowed to flow over the gravel bottom, it becomes immovable, as though set in mortar. The paving can be rapidly accomplished, one man being able to finish in a day, twenty-five boxes, fourteen feet long and thirty inches wide each. The material lies at hand in nearly every mining claim, and costs nothing but the labor of appropriation and selection.

"The advantages of rock sluices may be briefly stated. Those who have had long experience with them, assert positively that they save more gold than any other sluices in use, and a kind of gold which no other sluices save at all. Mr. Welch, of Indian Hill, Sierra county, who has 2,300 feet of rock sluice leading from his claims, declares that he saves twenty per cent. more gold than he ever did before, out of the same dirt. He has thoroughly tested the matter by having alternate sections of rock and block sluice, and invariably obtained more gold from the former. He, as well as others has observed that the rock sluices save the most fine gold, the almost impalpable powder of the precious metal, which is generally lost. For the same reason that more gold is saved, less quicksilver is lost.

"The rock sluices also effect a great economy of lumber. All other sluices are lined with blocks of wood about three inches thick, the cost of which, for each section fourteen feet long and thirty inches wide, is four or five dollars. These blocks have to be frequently renewed, owing to the great friction of rocks, earth and water running over them. In some instances, they will not outlast twenty days of washing. This was the case in the claims of Mr. Welch, where the saving effected by discarded blocks amounts to a very large sum.

* Bancroft's Hand-book of Mining for the Pacific States.

In his 2,300 feet of sluice there are, say one hundred and sixty-four boxes, that would require new blocks every twenty days; in three hundred days, each box would cost, at four dollars for every new lining, sixty dollars; and the expense of the entire sluice for the same period would be \$9,840. In the Kentucky claims, at Sweetland—where may be seen a very handsome specimen of rock sluice—the saving on the blocks for sixteen boxes, at four dollars each, amounts to about sixty-four dollars every forty days that washing is done. Here, then, without reference to the superiority of rock bottoms as a gold saver, is effected an economy that would alone render many unprofitable claims sources of income to their owners. One more recommendation of rock sluices is found in the fact that they offer fewer facilities for robbery. Thieves can help themselves in block sluices by simply scooping up the amalgam, as it lies in narrow crevices between the blocks; but here it is buried in sand, among stones hard to remove, and needing to be washed.

"Rock sluices are constructed upon a grade of from fourteen to sixteen inches for every fourteen feet, the heaviest dirt, or that which flows with least freedom, requiring the most grade."

(To be continued.)

A. KOHLER,

NO. 178 WASHINGTON STREET, SAN FRANCISCO.

Forty Cases of Musical Instruments Just Received,

Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS.

Also, TAMBOURINES, BANJOS, FIFES, FLUTES, CLARION PICALONES, VIOLIN BOWS, BOW-HAIR, ROSIN BRIDGES, PEGS, TAIL PIECES, FINGER BOARDS, TUNING FORKS, ESS ROMAN STRINGS (four lengths and four thread), and

ALL KINDS OF MUSICAL INSTRUMENTS.

Fresh every two months from Italy.

All of these goods will be sold to the trade, as they are direct importations from the manufacturers of Europe, and imported in large quantities by A. Kohler. He will sell them thirty per cent. cheaper than any other house in California; therefore it would be the interest of all to call and examine before purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by the case.

Wholesale department of this House is on Sansome street, occupying the whole block from Clay to Commercial street. mh5

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Considerable activity in mining sales during the last ten days up at Virginia City.

Potosi, \$200 per share.
Central, \$700 per share.
Ophir, \$1100 per share.
Gould & Curry, \$300 per share.
Chollar, \$15 per share.
Lucerne, \$20 per foot.
St. Louis, \$4 per foot.
Mount Davidson, \$60 per share.
Mark Anthony, \$8 per foot.
Louise, \$18 per foot.
Bradley, \$6 per foot.
Sacramento, \$8.
Shelton Co., \$5 per foot.
Josephine, Flowery, \$10.
West Branch, Flowery, \$8.
Harrison, Flowery, \$12.
Yellow Jacket, \$40.
Exchange, East Comstock, \$25.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$12.
Ohio and Buckeye Co. Argentine, \$12.
Chimney rock, \$16.
Dargen, \$10.
Rich Co., \$3.
Miller, \$12.
Augusta, \$6.
Spanish Co. Plymouth Ledge, \$6.
Chelsea, \$8.
Caneby Ledge, \$25.
Edgar Co., Great Western Ledge, Helena, \$25.

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.
[Having completed all the requisite arrangements, we lay before our readers a reliable list of prices of mining stocks of Utah.]

NOTICE.—THE GENTLEMEN OF SAN FRANCISCO ARE RESPECTFULLY informed that their NEW BILLIARD SALOON, with EIGHT FIVE CLASS PHELAN'S TABLES, will be opened for business on SATURDAY, Jan 29th, 1861. The undersigned respectfully solicits the patronage of all Gentlemen Billiard Players, and hope by conducting their Saloon in an unexceptional manner, to merit their continuance and support.

WHEELER & WILSON'S

FAMILY SEWING MACHINES!

NOT ONLY

THE BEST FOR FINE SEWING,

..BUT THE BEST FOR..

MANUFACTURING CLOTHING

..AND..

OTHER HEAVY WORK.

SAN FRANCISCO, June 6, 1861

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, Cambric and Tweed Suits, etc., from materials made at the Mission Wool Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them is not to be surpassed.

Various styles of Machines have been employed on the above material, but the Wheeler & Wilson is preferred.

DONALD McLENNAN,

Proprietor of the Mission Woolen Mill

July 6

Coffee Came to be Used.—It is somewhat singular to trace the manner in which arose the use of the common beverage of coffee, without which few persons, in any half civilized country in the world, now make breakfast. The time Columbus discovered America, it had never been known or used. It only grew in Arabia and Upper Ethiopia. The discovery of its use as a beverage is ascribed to the superior of a monastery in Arabia, who, desirous of preventing the monks from sleeping on their nocturnal services, made them the infusion of coffee, upon the report of shepherds, who observed that their flocks were more lively after browsing on the fruit of that plant. Its reputation spread through the Orient, and in about two hundred years it had reached Paris. A single plant brought there in 1714, became the parent stock of all the French coffee plantations in the West Indies. The Dutch introduced it into Java and the East Indies, and the French and Spanish all over South America and the West Indies. The extent of the consumption can hardly now be realized. The United States alone annually consume it at the cost, on landing, of from fifteen to sixteen millions of dollars.

Wheat Crop of the World.—The New York Tribune says it is an error to suppose that ours is the greatest wheat producing country. We do our full share, without doubt, but our system of agriculture is rapidly exhausting our best lands, and in a few years the diminution of the yield will be apparent in our census returns. Last year's crop is assumed to be 180,000,000 bushels, but the average is probably 120,000,000. The average of other countries is as follows:

Russia	191,422,248
France	145,840,000
Spain	164,000,000
Canada	60,470,174
Sweden	46,814,800
Austria	27,645,568
Romania	19,975,000
Prussia (export only)	18,921,776
Belgium	13,350,000
Portugal	5,500,000
Key (export only)	4,629,000
England	3,600,000
Denmark	1,000,000
Sweden and Norway	1,200,300

There is an annual production of over 600,000,000 bushels. The crops of this continent are included the total may be assumed to be 900,000,000, as the unascertained production of Russia and Turkey must be very large. No better evidence of the primary value of the wheat plant to the human family could be given than such an exhibition as this. It proves that where the highest civilization has been attained the greatest production has been realized.

Human Life.—The number of languages spoken is 4,064. The number of men is about equal to the number of women. The average of human life is 23 years. One quarter die before the age of 7; one half before the age of 17. To every 1,000 persons one reaches the age of 100 years, and not more than one 100 will reach 80 years. There are on the earth 1,000,000 inhabitants. Of these 33,333,333 die every year, 91,000 die every day, 7,780 every hour, and 60 per minute, or every second. These losses are about balanced by an equal number of births. The married are longer lived than single, and above all those who observe a sober and industrious conduct. Tall men live longer than short ones. Men have more chances of life previous to the age of fifty than men, but fewer after. The number of marriages in proportion of 76 to 100. Marriages are more frequent in the equinoxes, that is, during the months of June and December. Those born in spring are generally more robust than others. Births and deaths are more frequent by day than night. The number of men capable of bearing arms is one fourth of the population.

Perfect Appetite.—The man who wished he had a throat as long, and a palate all the way, might envy the feats performed in the world of insignificance. Some insects are endowed with an appetite so keen, and a digestion so rapid, that they eat incessantly throughout their whole lives. They live as soon as they are born, and go steadily on till they die. Their existence is a feast, without a change of plates or a pause between the courses. Morning, noon and night their throats are full, and an endless procession of favorite food gratifies the unwearied palate. They know not the names of meals. Breakfast commenced with infancy, and their only after dinner is a passage to another state of existence.—Once a Week

Absence of Mind.—What is commonly called absence of mind has never been considered incompatible with the presence of a vigorous intellect. The late distinguished mathematician, Professor H. —, of Aberdeen, was notorious for his absence of mind. Emerging hastily one day from the arched gateway of King's College, he stumbled against a cow, which chanced to be passing. In the confusion of the moment, the Professor dropped his hat, exclaiming, "I beg your pardon, madam!" Walking to Union Street, a few days afterwards, he did incidentally stumble against a lady who was walking in an opposite direction. In sudden recollection of his former adventure, he exclaimed, "Is that you again, ye brute!"

James Watt, in a letter written in 1770 described and patented a 'spiral air,' or screw propeller.

Pacific Foundry and Machine Shop. First Street, between Mission and Howard, San Francisco, California.—By recent additions to our before extensively established, we can confidently announce to the public that we now have

The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Steam-Saws and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months; Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron, Car Wheels and Axles of all dimensions; Building Froils; Horse Powers; Steam Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lam's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to. Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This Mill will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the State a Thousand Fold!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY
 Eastern Slope Gold and Silver Company, } Washoe.
 Burtola Mill Company, }
 Ophir Mining Company, }
 Union Reduction Company, } San Francisco.

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by these farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchasing.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SPEND-
 THE AMERICAN PATENT AGENCY OF MESSRS. MUNN & CO., and for more than
 ten years officially connected with said firm, and with an experience of
 fourteen years in every branch relating to the Patent Office, and the interest
 of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN
 APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a rejection, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C. Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as a gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

ASSAYS OF MINERALS CONTAINING GOLD.

Furnaces.

(Continued from our last.)

To prevent this sprouting from taking place, and to guard against the loss of metal that is liable to ensue, the cupel on which the button has brightened should be immediately covered by another, which has been kept red-hot for that purpose. The two are now withdrawn together, and allowed to remain on the ledge before the muffle, until the metal has been solidified, when the upper cupel may be removed, and the globe of rich alloy detached and weighed.

From the circumstance that silver is sensibly volatile at elevated temperatures, it becomes necessary to make cupellations of the buttons obtained from ores containing that metal at the lowest heat at which the absorption of the litharge can be readily determined. If, however, the cupel be not made sufficiently hot, an annular incrustation of crystallized litharge will begin to accumulate around its edges, and it at this point the fire be not immediately attended to, the deposit of oxide spreads rapidly over the whole surface of the metal, and the further progress of the operation becomes entirely stopped. In case of this happening, the mouth of the cupel must for a few minutes be closed by its door of sheet iron, and the heat of the muffle raised by the addition of fresh fuel: should this fail to uncover the bath, a small quantity of powdered charcoal may be sprinkled over its surface.

The temperature best suited for cupellation is obtained when the muffle and the enclosed cupels are at a full red heat, and the vapors which arise from the alloy curl gradually away, and are promptly removed by the draught. When the muffle is heated almost to whiteness, and the vapors rise to the crown of the arch, the temperature is too high, and when on the contrary the fumes lie over the bottom, and the sides of the openings in the muffle begin to darken, a little more fuel must be added through the door *f*, and the heat gradually raised. When the operation is conducted at a proper temperature, the cupel should be of a cherry-red color, and the fused alloy very bright and convex. At the commencement of the operation the heat must be a little raised, for the purpose of fusing and uncovering the button, and just before the globe is about to brighten, a slight elevation of temperature is again advantageous, but if a proper heat has been kept up during the progress of the operation, this is by no means necessary.

The success of an experiment is likewise considerably influenced by the force of the draught passing through the muffle. When the current is too rapid, the cupel becomes cooled, and the lead is oxidized with greater rapidity than it should be: in this case the litharge produced is not absorbed by the test as fast as it is generated, and consequently the surface of the alloy is covered by a coating of oxide of lead, by which it ultimately becomes protected from any further oxidation. When, on the contrary, the current is too feeble, the assay remains a long time in the muffle, and, if silver be present, a large amount is lost by sublimation.

If an assay has been properly conducted, the residual button is round, bright, and smooth on its upper surface, and beneath should be crystalline, and present a frosted metallic appearance; it is easily detached from the cupel; and readily freed from any adhering litharge. This globe is now removed by a pair of fine steel forceps, and slightly crushed between the jaws of a pair of pliers, by which the oxide of lead, which frequently attaches itself to it, becomes pulverized, and is removed by scratching with a small brush made of stiff hogs' bristles. When the buttons obtained on the cupels are extremely small, they are best flattened on a small anvil or steel stake, before being cleaned by the brush. The flattened discs are then examined by the aid of a powerful lens, in order to be sure that their surfaces are perfectly clean, and afterwards weighed in a balance capable of turning with 1/1000th of a grain weight. For the purpose of weighing the ore previous to its fusion with the litharge, as well as for ascertaining the weight of the button of lead obtained, when that is required, a pair of common apothecaries' scales may be conveniently employed.

When, in addition to gold and lead, the button obtained by the fusion likewise contains copper, it must be cupelled like the similar alloys of silver and lead, but as copper possesses a much greater affinity for gold than for silver, a proportionately large addition of lead must be made, in order to ensure the production of a button in which copper is not present. This proportion varies in accordance with the composition of the alloy operated on, as shown in the following table, in which is indicated the total amount of lead to be added to the various alloys of gold and copper, in order to obtain the former metal in a perfectly pure state.

Proportion of Gold contained in the Alloy.	Quantity of Lead necessary to completely remove the Copper by Cupellation.
1000 thousandths	1 part
900 "	10 "
800 "	16 "
700 "	22 "

200 "	34 "
100 "	
50 "	

Instead of using the cupellation furnace described at the beginning of this chapter, a small one, made of fire-clay, and bound with iron hoops, may sometimes be used with advantage.

These small clay furnaces are, however, liable to be broken, and are consequently inconvenient when they have to be carried to any considerable distance. The best crucibles to be employed for the fusion of the ore, are either the Cornish, or those known by the name of London pots, although, when made of good material, I usually prefer the latter. Those called four-inch pots are of the most convenient size.

CUPELS.—The manufacture of cupels is an extremely simple operation, and is thus conducted. The bone-ash obtained by burning bones, either in heaps, or in the larger assay furnace, is first pounded, and then passed through a sieve of fine wire gauze, and afterwards mixed with water until sufficiently moistened to retain the marks of the fingers when taken up and tightly squeezed in the hand. To give to the cupels, when made, a certain degree of firmness, a little carbonate of potash is sometimes added to the water with which the bone-ash is moistened. The amount of alkaline carbonate required for this purpose is exceedingly small, since a fragment of the size of a hazel nut will be amply sufficient to add to a pint of water. Instead of water, some persons use sour beer, and thus dispense with the use of any kind of alkali. The form of mould best adapted for the manufacture of cupels is represented by fig. 15, and consists of a beveled steel ring, *b*, and a die, *a*, made of the same metal, and fitted with a wooden handle. To make a cupel, the cavity is nearly filled with moistened bone-ash, which is first compressed slightly by the hand, and afterwards by the die, which is tightly driven into the ring by the use of such a mallet as is shown in fig. 16. When sufficiently consolidated the die is withdrawn, and by introducing a wooden cylinder which exactly fits the aperture, the cupel is without difficulty removed. The use of this wooden cylinder is sometimes liable to crumble the edges of the cupel, and for this reason a loose plate, *c*, exactly fitting the bottom of the mould, is frequently introduced, before the bone ash is placed in it. When this precaution is taken, the iron protects the bottom of the cupel, and enables the operator to use considerable force without injury to the edges of the newly made test. This iron plate must of course be replaced each time a cupel is made, and, with the test before it, is again forced out of the mould.

NO 17.

A CALIFORNIA INSTITUTION!

AS A REAPER.

AS A MOWER.

STANDISH'S IMPROVED COMBINED REAPER AND MOWER.

Since the appearance of the first reaping and mowing machines, men of mechanical genius have been busily engaged in their improvement, until at last we have a combined reaper and mower invented by an ingenious Californian, which will probably supercede all others at present in use. The inventor is Mr. P. H. Standish, at present residing at San Jose, Santa Clara county. The superior merits of this machine exist in the facts that, 1st—It is capable of doing more work in a given time than any other reaper and mower. 2d—That it does its work in better style. 3d—That it is simpler in construction. 4th—That it is less liable to get out of repair. 5th—That if it does get deranged in any manner, it can easily be repaired, and at trifling cost. 6th—That its price is infinitely less than that of any other machine. For the information of our farming friends we would state that we have secured the sole agency for this State, of this invaluable invention, and shall be happy to see or hear from any of them who desire to purchase county rights, or single machines. Letters must be addressed to "J. Silver-smith, Government House, San Francisco." We warrant the machine to give every satisfaction to purchasers. We are also ready to negotiate with Agricultural Implement makers, for its manufacture. A working model may be seen at the office of the MINING AND SCIENTIFIC PRESS, in San Francisco.

A number of these superior Reapers and Mowers are now in use in this State, and are highly spoken of by their owners. A few of the testimonials we have received are appended:

PACIFICCO, June 28th, 1860.

We would say to the farmers generally, that we have tried Mr. Standish's new patent reaper, and have found it to be the best we have ever seen! It runs much easier than others, is less complicated, and not so liable to get out of repair. We would respectfully invite all who want to purchase Reapers to call and examine for themselves, for we are confident they will be pleased.

JOHN W. BROWN, CHARLES MORGAN.

LAFAYETTE, June 27, 1860.
MR. P. H. STANDISH—Sir: We, the undersigned, did on or about the first of June, see your newly improved Cain Mower work, and, in our judgment, consider it one of the greatest improvements that has ever come under our observation, of the kind, and we cheerfully recommend it to the farming community, as it is purely a California invention, and contains many decided and valuable improvements.

Yours, truly,
G. W. HAMMETT, A. BALDWIN,
M. CROGER, CHARLES MCCARRON,
D. R. MEACHAM.

June 12th, 1860.

MR. STANDISH—Sir: Your Mower was tried in my cloven meadow yesterday evening; it was rank thick grass and very much lodged. It performed well, as well as any machine could do. I saw it cutting oats in Mr. Harnel's field, and I am pleased with its performance. The cam wheel power over that of the cog wheel for driving a reaper knife must have a decided preference with farmers, on the score of economy, if for no other reason. There is no wear compared to the cog wheel power, which gives out and becomes useless in two years or seasons. The cam wheel will be as good after twenty years wear. I have no doubt of its being the right principle of driving the reaper knife, and when introduced into use will be preferred to the present cog wheel plan. It saves all the wear and tear of cogging-bearings and boxing, and if the plan is carried out and brought into use, it will save thousands of dollars to the farmers in buying reapers every two years.

Yours, with much esteem,
ELIAM BROWN.

PACIFICCO, June 23, 1860.

MR. STANDISH—Sir: This is to certify that I have operated one of your mowing machines, and find it to be, in my opinion, one of the best machines for mowing that I have seen work in this State. I also think that the draft is easier than a cog wheel machine, and also that it will not clog in the knife, in clover, or eat any grass.

Witness: Washington A. Wilson, W. T. Hendrick.

LAFAYETTE, June 27th, 1860.

MR. STANDISH—Sir: I saw your mower at work in down clover and oats of very heavy growth; it performed better than any mower I have ever seen. For simplicity, durability and lightness of draft, it certainly has not its equal.

Respectfully, yours,

WARREN BROWN.

THE FOSSATT CLAIM.—The Fossatt Land Claim case will come up for argument in the U. S. District Court on the 22d inst. It is claimed that it comprises the New Almaden Quicksilver Mines in Santa Clara county.

PAPER MILLS.—Two paper mills are hard at work in this State, and find a ready market for all they can turn out. One is in Mariu county, the other at San Lorenzo.

RAILROAD EXCITEMENT IN SONORA.—We learn from reliable authority that the greatest enthusiasm and public spirit is now prevailing in the State of Sonora, Mexico, upon the subject of a Railroad connection between the Valley of the Rio Grande and the Gulf of California. The passage of the bill authorizing Gen. Trias and his co-partners to construct a railway from El Paso to Guaymas is approved by all the wealthy and patriotic men in the State, and they are fast taking stock and embarking their all in the enterprise. John A. Robinson, for more than forty years a resident of Sonora, and the wealthiest merchant in Guaymas, an American of much public spirit, has gone to London to make arrangements for procuring the necessary iron rails to lay the track. Many heavy capitalists in San Francisco are also interested in the project, and are lending the weight of their influence in aid of the undertaking.

HENNESS PASS TURNPIKE.—We learn from Mr. Freeman, who has just returned from the Henness Pass, that the new road of the Truckee Turnpike Company to Jackson's Ranch, is in splendid condition, hard-packed, and fully equal to any mountain road in the State. The road beyond Jackson's, which was undertaken by the Nevada (Henness Pass) Turnpike Company, is now in charge of Mr. Freeman, who has thirty men at work upon it, and will soon have thirty or forty more helping them. He thinks the road will be in complete order over the summit by the first of next month. Meanwhile loaded teams can pass over it easily, and the usual amount of summer travel is briskly setting in. Next week, Mr. Haworth, President of the California Stage Company, will visit the route as far as the summit, to ascertain if it is in fit condition to be stocked for stages this season.—Exchange.

GRIZZLIES.—Bears are very plentiful and hold about San Antonio, Monterey county. Encounters with them are numerous and sometimes fatal to the men, and they feed extensively on mutton.

A decimal system of coinage has been adopted in Mexico.

ASSAYS OF MINERALS CONTAINING GOLD.

Furnaces.

(Continued from our last.)

SCORIFICATION.—Scorification, like the fusion of the ore with litharge, has the effect of producing an alloy, which may be subsequently passed to the cupel, and a fusible slag, composed of oxide of other substances excepted of the In the fusion with the oxidation of the stances which are produced by the action contained in whilst an equivalent is reduced to the me enters into combination with the gold and silver which the mineral may contain, to furnish the required alloy. When, on the contrary, the process of scorification is adopted, these substances are oxidised by the aid of atmospheric air, whilst the litharge necessary for the fusion of the earthy and siliceous matters is itself formed by the oxidation of a portion of the metallic lead which is added to the ore to be assayed. For this operation, instead of using cupels made of bone-ash, small vessels, of the form represented in fig. 17, and made of close-grained fire clay, are employed. These scorifiers are heated in the muffle of an ordinary assay furnace, and as many assays may be introduced at one time as there is room for in the muffle.

16.

Before introducing the scorifiers into the furnace, they are each charged with a determined weight of the mineral to be operated on, reduced to the state of a fine powder, and intimately mixed with a certain quantity of finely granulated lead. They are now placed in the muffle, and there strongly heated during a quarter of an hour, with the door at the mouth closed. At the expiration of this time the lead will be found to be melted, and the mouth of the muffle is again opened. The current of heated air which now passes through the muffle immediately begins the process of roasting, which is continued tranquilly, without there being any necessity for continual stirring, as is frequently the case when substances are roasted in the muffle without the addition of lead. The effect of this oxidation is to produce a slag on the surface of the metallic bath, and this,

17.

which at first accumulates around the edges of the scorifier, soon becomes extended over its whole surface. These slags, which at the commencement of the operation are frequently solid, gradually become soft, and finally remain in a perfectly liquid state; since, in proportion as the operation advances, the quantity of oxide of lead which they contain becomes more and more considerable.

When it is thought that the scorification has been sufficiently advanced, the fused matters are well stirred with a slender iron rod, for the purpose of mixing with the mass any hard and pasty substances which they may contain, and which might otherwise remain attached to the sides of the vessel. After this the muffle is for a short time strongly heated, and the slags thereby rendered as completely liquid as possible. The point at which the scorification has been sufficiently advanced may be recognised by placing in the mixture a small iron poker, previously heated to redness; and when, on withdrawing this, it is found covered with a slight film of scoria, which runs off without forming a small solid drop at the end of the rod, the operation may be considered complete. This condition of the slag is indispensable, in order that no metallic buttons may remain adhering to the sides of the vessel.

When this point has been attained the operation is terminated, and the scorifier immediately withdrawn from the fire by means of proper tongs, and the alloy poured into a mould of the form represented in fig. 18.

When cold, the metallic button is readily separated from the slags, and may be passed on a cupel in the usual way.

18.

The process of scorification is, without exception, applicable to the assay of all kinds of auriferous and argentiferous ores, and is at the same time one of the most exact methods that can be employed. When the gangue or matrix of the ore assayed is siliceous, the oxide of lead, which is formed by the roasting of the metallic lead, combines with the silica to form a fusible silicate; whilst the remainder of the lead, which escapes oxidation, unites with the silver and gold which may be present in the ore. When these metals are in combination with other metallic substances they absorb oxygen from the atmosphere, and the oxides produced combine with the litharge formed at the same time, and thus gives rise to various fusible compounds.

The chief and most valuable feature of the process of scorification is, that however small may be the proportion of lead employed, the slags produced never contain any oxy-sulphides at the close of the operation; and from this it follows that they rarely retain the most minute trace of either gold or silver. We have, moreover, seen that the assay of the sulphides and arsenio-sulphides by means of litharge is attended with considerable inconvenience, from the amount of that oxide which it is necessary to employ; since for the first 30 parts,

and for the second as much as 40 parts, are sometimes required, and if these amounts be not respectively added the slags will retain sulphides in combination, by which the results of the experiment will be more or less vitiated.

PARTING.—When, as is frequently the case, the button produced by the fusion of the ores contains, in addition to lead and gold, a certain proportion of silver together with traces of copper, it must be cupelled at a moderate temperature, and, if necessary, an additional quantity of silver added. By operating in this way the button obtained on the cupel consists of an alloy of silver and gold, which is afterwards treated with an excess of nitric acid; this effects the solution of the silver, and leaves the gold untouched in the form of a brown sponge, in the bottom of the flask in which the experiment has been conducted. In order, however to obtain perfectly exact results, it is necessary that a certain relation should exist between the amount of the two metals of which the alloy is composed; since, if the silver be not present in sufficient quantity, the mixture is not completely attacked by nitric acid; whilst on the other hand, when too large a proportion of this metal is added, the gold remains in a pulverulent form, which renders its collection for the purpose of weighing extremely difficult.

This operation, which has received the name of *parting*, is found to succeed most fully when the alloy contains a little less than three parts of silver to one of gold, and therefore, in all cases where the greatest exactitude is required, the addition of silver must be so managed as to agree as closely as possible with this proportion. If the alloy contain less than two and a-half parts of silver to one part of gold, the solution of the silver is not readily effected, as in this case some of its particles are so enveloped in gold as to resist for a long time the action of the strongest nitric acid.

The operation of adding the proper amount of silver to an alloy of gold to reduce it to the best standard for the process of parting, is called *inquartation*. The quantity of silver necessary for this purpose is estimated in accordance with the approximative composition of the alloy produced by direct cupellation. This may be judged of either by the touchstone, as will be presently described, or in many instances by a simple inspection of its color and hardness.

The inquarted button, when obtained, should be carefully flattened with a polished hammer (as 1. in fig. 16) on a steel anvil, and afterwards attacked in a small flask or test tube by nitric acid of specific gravity, 1.15. After being boiled with acid of this strength until the red vapors at first given off have ceased to be evolved, the residua is again heated to ebullition during ten minutes to a quarter of an hour in acid of specific gravity 1.25. At the expiration of this time the acid is carefully poured off and the residual gold, after being carefully washed with distilled water, is transferred to a thin porcelain capsule, from which the water is partially removed by pouring, and the remainder evaporated by exposure to a gentle heat. After being heated to redness the pulverulent gold may be either weighed directly in an accurate balance, or be folded in a small piece of poor lead foil, and again passed to the cupel so as to obtain it in the form of a pure metallic globule. It is of the greatest importance that the acid employed for the above operation should be perfectly free from chlorine.

ASSAY OF GOLD DUST AND ARTIFICIAL ALLOYS.—As in these cases the standard operation is in most instances approximately known without having recourse to any preliminary investigation, the operation usually commences by fusing the alloy in a cupel with about five times its weight of poor lead, and then adding the amount of pure silver necessary to bring the mixture to the proper composition. After having in this way obtained a button by cupellation, it is first flattened on an anvil, and afterwards annealed by being heated to redness in the muffle, and allowed to cool. It is then drawn out into the form of a long slip by being repeatedly passed between the rollers of a small flattening-mill. During the progress of this operation the metal requires to be a second time annealed, and when sufficiently reduced in thickness should represent a metallic ribbon of about three-eighths of an inch in width, and three inches in length. A convenient weight of alloy to operate on is 12 grains, as this, as will be shortly explained, bears a simple relation to the carat. In flattening the cupelled button, it is, however, necessary that it should be reduced to a suitable thickness, so that on the one hand the silver may be readily dissolved, whilst on the other, if the lamination be carried too far, the gold remaining at the close of the experiment will not possess sufficient coherence to admit of being conveniently removed and passed to the muffle. The strip of alloy thus prepared is now wound in the form of a spiral around a piece of iron wire, or the barrel of a quill pen, from which it is removed to a small glass matrass capable of holding about six fluid ounces, which, with the tongs used for holding it, is shown in fig. 19.

19.

Instead of employing a flask of the form here represented, a small bulb-shaped matrass with a long neck is frequently used: this latter form is now generally adopted by the best assayers of bullion, both on the continent and in this country. About two ounces of nitric acid of specific gravity 1.15, are now added, and the whole exposed to the temperature of ebullition until red fumes have ceased to be given off; when this occurs the first liquor is carefully poured off and replaced by the same quantity of acid having a specific gravity of 1.25; when this the residue is briskly boiled for another ten min-

utes, after which it is poured off, and the remaining gold carefully washed. The flask is now entirely filled with distilled water, and after covering the neck with the thumb, so as to prevent the escape of any of the liquid, it is so inclined as to allow the corner of spongy gold, which retains the form of the original alloy, to descend slowly and without breaking to the neck of the matrass. The metallic spiral is now carefully allowed to drop into a small earthen crucible, fig. 20; the water is carefully poured off, and when quite dry the whole is heated in the muffle to bright redness. In these operations the stronger acid is not at first applied, because it is liable, by its rapid action on the silver, to divide the gold in the form of powder; but some of the best assayers are in the habit of using acid of the density of 1.20, and in this case, if the operation be skillfully conducted, there will be no need of any subsequent addition of stronger acid. When the attack has been carefully conducted the gold remains in the form of a friable brown sponge, having very nearly the same dimensions as the original spiral of alloy; on heating this, however, as before described, it contracts very considerably, and at the same time acquires the color and consistence of ordinary malleable gold.

20.

The results thus obtained differ from one-quarter to one half thousandth from the actual truth, and are therefore sufficiently exact for every commercial purpose.

THE TOUCHSTONE.—When the apparatus and reagents necessary for the carrying out of a complete assay cannot be procured, a very near approximation to the truth may be obtained by the use of the touchstone; and as the materials employed for these operations are extremely portable, its use is sometimes attended with considerable advantage. This process essentially consists in rubbing some convenient part of the object to be examined on a hard, siliceous stone of a dark color, on which it thus leaves distinct metallic traces; from the aspect of these marks, and their behavior when treated with nitric acid, the operator judges of the value of the gold subjected to examination. The material employed for this purpose, and which is generally known by the name of touchstone, is a coarse-grained species of quartz colored by bituminous matter, and of which large quantities are found in Saxony, Bohemia, and various other localities.

In order to be enabled to judge of the value of an alloy from the nature of the marks left by it on the surface of the stone, the assayer is furnished with a series of small bars or touch needles, formed of alloys (either of copper and gold, or of silver and gold, as the case may be, and of which the composition is accurately determined.

MODES OF PLACER MINING.*

The Under-Current Sluice.

(Continued from our last.)

The under-current sluice is another variation from the simple sluice. Mr. R. Dunning, who claims to be the inventor of it, gives the following description of it and exposition of its merits:

"By means of two or more iron bars at the termination of a section of sluice boxes, forming a right angle grating, a portion of the dissolved earth, fine gravel and water is separated from the lumps of hard earth, cobble stones and gravel, and drops into a set of more gently graded sluice boxes beneath, when they flow slowly off in another direction, while the body of water and coarse material dashes down a 'dump' or 'fall,' to be again taken up in sluices with the tailings from the under-current, and subjected anew to separation.

"This process insures a more thorough amalgamation and saving of the particles of gold, the most of which drop through the grating into the under-current, where, being subject to a less violent motion, and passing through a greater variety of riffles, they are more likely to be finally arrested. It effects a large saving of rusty gold, which will not readily amalgamate. It gives more opportunity for saving gold in a short distance, and to scour cement without loss of tailings and grade.

"On hill sides, where there is abundance of space, it is a valuable adjunct to tail sluices: where the latter terminate at the river's edge, and would otherwise discharge all of their contents into the stream, the under-current can be made to receive the best portion of the tailings, and convey them for any distance along the bank.

"The immense friction of rolling rocks being removed, the under-current effects a saving in false bottoms of about seventy-five per cent.

"At San Juan Hill, Nevada county, where this invention was first introduced, and is now extensively used, it is considered a valuable improvement—saving both gold and quicksilver in much larger proportion than the ordinary sluice without it.

"The saving effected from tailings in one instance is equal to twenty-five per cent., and might be increased; the amount of economy, of course, depending upon the extent to which the under-current is employed."

(To be continued.)

* Hancock's Hand-book of Mining for the Pacific States.

PROGRESSING.—The railroad from Folsom to Lincoln is fast approaching completion.

A Word to California Farmers.

We observe that the millers of California are bent upon making the farmers furnish them clean instead of dirty wheat. The millers of Yuba county, according to the *Appeal*, have declared that they will not encourage this nuisance any longer, and producers may be sure that wheat which was the refuse of their threshing ground and a heterogeneous admixture of unmerchantable rubbish in it, will find its proper price, and be classed with "rejected" or "inferior" when, with due care, it might command the highest current rates. There is no excuse, with the present present prices, for such a shiftless policy as has heretofore been pursued by our farmers, and it is to be hoped that this year's crop will be able to redeem the reputation of California wheat in foreign ports.

The *Napa Reporter* says, in connexion with this subject: We see by some of our late exchanges, that the large quantities of barley, oats, etc., present in the wheat shipped from California, has tended materially to depreciate it in value; and our farmers, and all interested in the grain business, should pay particular attention to this fact if they want a market to ship their surplus grain to. Practical millers have always felt the want of complete and perfect machinery for cleaning grain, or rather separating not merely wheat from the chaff and foul matter, but the wheat from the oats and other grain, which is often mixed in growing; and ingenious mechanics have experimented a great deal in trying to produce the machinery so much desired. Up to this point, but partial success has attended their efforts. It is with great pleasure then, that we call the attention of our farmers, millers, and the interior press, to the fact, that this want can now be supplied by the purchase of Turner's Improved Combined Smutter and Grain Separator—the most perfect machine of the kind in the world. It has no equal in scouring, separating, and otherwise cleansing grain from sand, chaff, grown wheat and other impurities. As wheat always contains, when brought to market, more or less sand, dust, chaff, and other foul stuff, and in passing it through a smut mill, if the grain be the least damp, the smut, dust, etc., are liable to adhere, it is absolutely necessary that the smut balls should be taken out unbroken, before the grain enters the Smutter, and the dust pass out as soon as scoured from the berry, that the grain may not wallow in it.

In this machine, the Smutter is composed of from three to seven sets of horizontal scouring plates between which the grain passes. The lower plate or roller of each set is provided with beaters, which throw the grain against the upper plate, which is stationary and also provided with beaters, thereby causing the grain to act against both plates with equal certainty and uniformity. A rough or sharp surface is not depended on for scouring, but it is claimed that what the machine will do the first month it will continue to do for years in the same manner.

The grain enters at the top, where it first falls upon a zinc or sheet iron riddle, through which the grain passes, taking off sticks, stones, etc., over it. The grain then falls upon the first inclined plane, then into the first blast from the fan at the bottom of the machine, which takes out most or all of the smut balls, oats, chaff, and other light impurities, before the grain enters the Smutter. This all millers know to be of the greatest importance, particularly if the grain be damp. The grain then passes out of the blast of the Separator into the Smutter, the dust passing through the perforated case opposite each set of plates, and drawn up into the top fan and carried out of the Mill if desired—the grain passing through the Smutter, discharging the heavy screenings at the angle in the enlarged spout.

The Machine is well ventilated, by a blast from the lower fan into the center of the Machine, by which there is no possibility of its ever becoming filled up or clogged with dust.

This Machine makes five distinct separations: 1st. The heads, sticks, etc., over the Riddle. 2d. Screening from the first blast, (which are the lightest,) and before the grain enters the Smutter. 3d. The dust. 4th. Screenings from the second blast of the Separator, after the Smutter. These last are free from dust, and in good condition to grind for feed or otherwise. 5th. The clean grain, at the bottom of the Machine.

Only one driving belt is required, and but two in all—and can be as easily attached as any upright Smutter. Rolling screens may be dispensed with, except for cockle.

The step of the Smutter shaft is the only place from whence arises any danger from fire, by the friction of the Smut Mills; hence the absolute necessity of having the step always in sight, and convenient to be oiled, with no liability to run dry, from its situation being unapproachable without taking the Machine to pieces. All Millers, and all vigilant and competent Insurance Agents, should thoroughly examine all Smut Mills and report to their principals, whether the step of the Machine can be examined daily,—its facility for oiling,—its contiguity to wood,—the velocity of the Machine, and its liability to clog with dirt. As sad mistakes have been made in this important matter, all parties interested are particularly requested to examine this Machine. Aside from any danger from fire, the convenience of the miller should be consulted. He is desirous of knowing and should know to a certainty, that the step is oiled and in good order, and this he should be able to ascertain with as little trouble as possible, and as often as desired. In this machine the step is always in sight, and can at all times be examined and oiled as easily as any ordinary journal. It holds nearly half a pint of oil, and can at any time be drawn off and replenished. No

grit or dirt can remain in the step, but will be thrown off into a lower cavity. From these considerations the Machine is regarded fire proof.

Millers and farmers desiring to obtain this valuable machine can do so by applying to J. S. LYERSMITH, proprietor MINING AND SCIENTIFIC PRESS, No. 20 and 21 Government House, San Francisco—he being the sole agent for California. He would also be happy to confer with parties desirous of purchasing the right to sell the "Combined Smutter and Grain Separator," in any county of the State.

TO INVENTORS AND DISCOVERERS, MECHANICS AND MACHINISTS:

The undersigned, having had great Experience and Facility for completing and carrying out Inventions and Improvements upon all kinds of Machinery and Implements, also preparing the requisite Drawings, Models, Drafts and Specifications, and is otherwise conversant with all principles in Mechanics of modern practice, and could prove, therefore, of invaluable aid to Inventors and Discoverers. Those contemplating bringing their inventions in a proper shape before the U. S. Patent Commission are particularly requested to consult the subscriber.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved

AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz.

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, or whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,

At Fifty Cents per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

FREE VS. FELON LABOR.

During the present week, a meeting was held by the Coopers of this City to take action upon the subject of the employment of convict labor in our State Prison. At that meeting the following preamble and resolution were unanimously adopted;

WHEREAS, Owing to the disgraceful action of our State authorities in bringing their criminals into competition with us, thereby trying to deprive us of our means of support, as well as to insult and degrade the trade to which we belong; and whereas, we are compelled to organize for the protection of ourselves and families and the honor of our present trade; be it

Resolved, That we resort to all legal means in our power to prevent the authorities from carrying out their designs for the enrichment of heartless capitalists and our degradation and ruin; and we pledge ourselves to maintain this organization and leave nothing untold to effect our objects—viz., The prevention of convict labor in opposition to industrious mechanics.

We find no fault with the coopers or any other mechanics for their action in this matter; but we cannot help expressing the belief that they have been a little over hasty. We have yet to learn that they have suffered from State Prison competition. The injury they seek to avert is more an ideal than an actuality, and that ideal lies in the future and affects not the present. That the State authorities, by leasing convict labor are "trying" to deprive the citizen coopers, or any other citizen mechanics, of support, is simply absurd. No less so is the intimation that such action on their part is intended "to insult and degrade the trade" to which they belong. There are bad men in all professions and trades—men who for crimes are incarcerated in the State Prison—but the professions or trades to which such felons belong do not suffer in standing because some of their members are in Prison!—neither can the coopers' trade be insulted or degraded, because convicts are set to work making easks or whatnot. As well might it be said, that because convicts eat, and drink, and sleep, and wear clothes, and speak and write, that the whole world, engaged in doing the same things, are insulted or degraded!—Besides it should be remembered that the true policy of every government is "the greatest good for the greatest number." The people of our State have been heavily taxed for the support of the State Prison and its inmates. They are heartily sick and tired of the burden, and when they look abroad, and find that the Penitentiaries of other States are rendered self-supporting through the medium of Prison Labor, and that trades are by no means seriously injured by such competition, they naturally desire and demand that a somewhat similar system be adopted in this State, to their own pecuniary relief, the welfare of the convicts, and the increased prosperity of the State. For our own part we cannot conceive why such an awful bubbl should arise because a few convicts are set to work in various departments of trade. No harm can result from it, in our judgement, and if there did, it would be more than counterbalanced by the good. How desirable is it that these men who, through the culpable carelessness of their parents, or their own vicious idleness when young, have no legitimate vocation in life, but are forced to the highway, or other paths of vice and crime, should be taught some trade whereby, upon release from Prison, they can earn an honest livelihood, and regain the positions to which they all ought to aspire! Thus, besides being a self-sustaining Institution, our State Prison furnishes the means for reformation.

HOME GROWN AND CURED TOBACCO.—Every body knows that tobacco grows well in this State, but thus far it has not, when manufactured, met public expectation—the reason it is said, being that it is not cured well. W. Simon of Marysville informs us that he has, after considerable experiment managed to cure it properly; and that he is now manufacturing segars from home grown and cured tobacco, raised from Havana seed, which are equal to any.—*Appeal*.

GOING TO THE WARS.—It is stated that Professor Jonkheym has resigned the Chair of Modern Languages, at the University of the Pacific, to join his old military chief, General Scott. He acted as U. S. Interpreter during the last war with Mexico.

OPOLIS.—A place down in Calaveras they have called Copopolis, and it is now in contemplation to change the name of Whiskytown and call it Grogopolis.

FLAX INSTEAD OF COTTON.

In Eastern exchanges we notice that considerable attention is being paid to the subject of substituting flax for cotton. It is held by many that in the coarser fabrics it can certainly be used to advantage, which is a great point gained. The matter recently came up for discussion in the New York Board of Commerce. Mr. Samuel B. Ruggles, in moving the adoption of a resolution referring the subject to a committee to examine into and report upon the progress made in chemical, mechanical, or other processes for substituting flax fibre for cotton, stated that the idea was by no means new. It was proposed in England as early as the year 1775, and with partial success, and repeatedly afterward in Germany, Bohemia, and other parts of Europe, by various processes suggested in the years 1780, 1803 and 1816. It was in the year 1850 that the Chevalier Clausen obtained his patent in England for extracting the fibre of flax by means of chemical agencies, in lieu of the former tedious, wasteful and unhealthy process of rotting by dew or standing water. The importance of the suggestion excited at once the attention of our highly intelligent and patriotic fellow-countryman, Abbott Lawrence, then in London as American Minister, and, at his instance, the subject was carefully examined in the year 1851, by a Committee of the Legislature of Massachusetts. The chemical process of Clausen, improved, as is said, by subsequent discoveries, after the delays incident to all new inventions, has proved so far successful that the flax fibre thus extracted and prepared is now successfully manufactured in considerable quantities in various parts of New England. In addition to these chemical agencies for extracting the fibre, mainly by solutions of acids and alkalis, another very interesting process of a mechanical character has lately been proposed, and proved to be very successful, by employing condensed steam as a disintegrating agent. It deserves the most attentive examination, it being claimed by the inventors that the flax fibre may be thereby prepared with great expedition and economy, so that it can be afforded in large quantities for a price not exceeding eight cents per pound. It is further stated, that an acre of flax land will yield a sufficient quantity to afford the material for a bale of fibre of about 400 pounds. It should be distinctly understood, that the fibre of flax is not identical with that of cotton, in a botanical or physiological sense, but that they are greatly alike in color, weight and durability.

In one of our exchanges we find an article which informs us that there are now in operation in Boston, experimental works for the manufacture of flax fibre into a material called fibrilla or flax cotton. This can be produced in any quantity at between 7 and 8 cents per pound, and the cloth made from it is better in every respect, and will take and preserve colors better than cloth made from cotton. The raw material, flax wild or cultivated, can be and is produced in Canada and all the Northern States in vast quantities. Col. Lauder, in one of his recent reports speaks of coming to plains covered with immense quantities of this plant growing wild. Now here is an article which even now can be had in quantities, so that its material can be produced at from 2 to 3 cents per pound less than cotton, which makes a better cloth, and which is destined to supercede cotton. Slowly but surely the parties owning the patents for the process for manufacturing this article are working it into the attention of our people.

The *Scientific American*, however, throws cold water upon the schemes of the flax advocates. It asserts that in the present state of the arts, flax cannot be produced as a cheap substitute for cotton because the former must necessarily go through so many more processes than the latter, before it is ready for the manufacturer, and that it is a delusion to suppose that it can be manufactured into goods and sold at anything like the price at which cotton fabric have been sold during the last thirty years. This may be a correct view of the matter, but it manifestly clashes with the statements received from other sources. If the statement in regard to the results of experiments in Boston be correct as to the cheapness, durability, etc., of the flax fabric there manufactured, then the *Scientific American* is incorrect. At all events that paper merely grounds its belief in the assumption that the inventive genius of America is not equal to the emergency of the day. We, on the contrary, believe that the series of experiments now being instituted in the East, will result in a complete triumph of flax over cotton—that new and cheap processes will speedily be discovered by which the former will forever take the place of the latter in the coarser fabrics—and believing this, we would recommend that some attention be paid by the people of California to the raising of flax. This could be done, in any event, we think, with great profit to those engaged. We have thousands of acres of idle land within our borders where the flax plant would flourish luxuriantly. Here, too, is a field whereon Coolie labor might be employed without affecting white people. Let some of our minded men follow our suggestion—which would prove no experiment, but a "dead certainty."

CALIFORNIA GRAIN CROPS.

The export of grain and flour for the year ending June 30th, 1861 says the *Marysville Appeal*, was as follows: Flour, 196,774 barrels; Wheat, 1,529,924 sacks; Barley, 339,557 sacks; Oats, 116,462 sacks. From this statement it appears that our exports of wheat during the year just ended, counting flour as wheat at three sacks to the barrel, amount to 1,120,247 sacks, averaging 100 pounds each, which is equal to 3,533,744 bushels. The deliveries for home consumption are estimated at 50,000 barrels per month, or 3,000,000 barrels for the year. The requirements for distillation and feed of animals are estimated at 400,000 bushels for the year; amount taken for seeding at 500,000; stocks of wheat and flour on hand at San Francisco, 71,585 bushels, making a total for the year, 7,505,329 bushels. After deducting from this the amount on hand June 30th, 1860, the probable wheat yield of the State for the year 1860, would seem to have been 7,286,969 bushels. As the stocks on hand in the interior are less than they were last year, some think as much as 50 per cent. less, perhaps this total should be reduced to 7,200,000 bushels as the aggregate yield, and this is thought to be within the truth. The average price of wheat for the year has been \$1 52½ per 100 lbs. at which rate the crop has yielded the very satisfactory sum of \$6,582,600. The average expense to the farmer of marketing his wheat during the past year, including sacks, freights, and commission, but not including any charge for storage, has been about 35c per 100 lbs, leaving a net result of \$1 17½ per one hundred pounds, or say 70½c per bushel—a low price indeed, as compared with some other portions of the world, and yet remunerative here in good seasons, owing, in part to the superior productiveness of our soil, but chiefly, we think, to the favoring influence of climate, especially in time of harvest. These advantages more than overcome the higher wages of labor and rates of interest current in this State, and enable us to compete successfully in the most distant markets. The total annual product of the great wheat growing nations, including the United States, which justly occupies a place in the first rank, cannot fall much short of 1,000,000,000 bushels. Our little crop seems lost in this vast aggregate, like a drop in the ocean; and yet we allude to the fact as not an inapt illustration of our undoubted superiority as a grain growing country, that we can send forth our surplus in the face of such an immense supply, overcome the expense of a long transit, and sell even in the great central marts at a price that leaves a margin to the producer. The barley crop for 1860 is given at 1,665,553 bushels; of which amount 611,203 bushels were exported, 1,728,000 used for home consumption, 360,000 for seeding, and 133,945 bushels on hand, not counting 200,000 sacks estimated to be remaining in the interior.

The average price of barley during the past year has been at \$1 02½ per 100 pounds, or a little more than 51c per bushel, at which rate the crop has realized the value of \$1,362,700. The exports of wheat for the year just ended were about four times greater than those for the preceding year; and the exports of barley five times greater. The yield of both grains this season, though less per acre than last, will aggregate as much or more, a larger area having been sown. The oat crop for the year just ended was 567,266 bushels, of which amount nearly one-half was exported. The average price has been \$1 33½ per 100 pounds, or about 53½c per bushel, at which rate the crop has yielded the value of \$302,542. In the foregoing computations the weight of a bushel of wheat is assumed to be 60 pounds; of barley, 50 pounds; of oats, 40 pounds; which is believed to be a near approximation to the true average upon this coast, although wheat often ranges higher. The chief purchaser for our grain abroad was England, Australia coming next, though the heaviest barley shipments were to New York, and the largest oat shipments to Australia. The foreign demand at present, except for barley, is not very brisk. The new crop is coming into market at prices which may be seen regularly quoted in our San Francisco dispatches.

NEW CALIFORNIA WORKS.

Messrs H. H. Bancroft & Co. of Montgomery street have laid upon our table "The Bee-Keeper's Directory" which describes the theory and practice of Bee culture in all its departments, written by J. S. Harbison, practical apiarian, and giving the result of eighteen years personal study of the habits and instincts of this valuable insect. It is intended as a reliable directory for the use of those who desire to learn the science of Bee-keeping, and the practical working of an apiary—and as such it is most thorough and complete. It contains eighty lithographic and engraved illustrations. We cordially recommend the volume to Californians, as the most complete and valuable work of the kind they can procure.

To the same enterprising book publishers we are indebted for Kibbe's Infantry, Light Infantry, Riflemen and Cavalry Tactics (second edition), so highly recommended by General Wool and other officers in the U. S. Army and the State Militia. At the present juncture of National affairs this work will prove highly acceptable to our volunteers. It is complete in detail, handy in form, neat and durable in style.

We have also received the San Francisco Medical Press, edited by Dr. E. S. Cooper—an invaluable quarterly to the profession, and exceedingly interesting to the general reader. The present number abounds in judiciously selected and able original essays.

SUMMARY OF MINING NEWS.

CALIFORNIA.

Our contemporaries in the interior continue to afford as scanty material worth to make up for foreign as well as home pursuit, a complete and reliable summary of the mining yield in this State. With a little trouble we are sure they could furnish the data, so much desired. From the accounts which reach us, it would seem that Sierra is the richest county in the State, that we know is not so, but is owing simply to the fact that the excellent persons of that county take more pains to supply their readers with such information. Nevada, a county where we banded pick and shovel for many a year, and with whose mineral resources we are tolerably familiar, seems to stand still, because the papers there (good ones too, in all but this particular) take no trouble to inform the world of noteworthy mining yields, these are but instances of an inertia that should not exist. Our object in collecting such matter is, as we have before stated, to give the people in other portions of the United States a true idea of California's mineral wealth, and its extent or continuity, and thus to induce larger immigration from the Atlantic shores to ours. Knowing as we do the great and continuous yield of gold in this State, we dislike excessively to chronicle in that part of our Summary devoted to another State or Territory, greater yields than ours can (apparently) produce. Our mountain contemporaries then will pardon the suggestion, in view of the motive actuating us. . . . From a review of what has come beneath our notice, we believe the gold produce of California holds as follows. As to silver discoveries and mining, we hear very little indeed, the copper mines of Calaveras, Anador, San Joaquin, Stanislaus and Tuolumne counties continue to excite attention, and some excitement will doubtless be occasioned by the discovery of copper in Alameda county. . . . An item appeared in the Alta, of Thursday, as follows: "The Bailey Mining Company send several men by the steamer Senator to-day to Los Angeles, with instructions to bring a ton of the ore of the Bailey lead to this city. There are 900 shares in this Company, and they have been assessed \$2 per share to pay the expenses of this expedition; which assessment, amounting in all, to \$1,800, was paid at Sims' bank yesterday. Mr. O. B. Ragly, the President of the Bailey Company, goes with the party. Mr. Robert Bailey, the discoverer of the Bailey lead, conducts the party to the locality, and will take workmen with him. Representatives of the same lead, also go down on the steamer. They are all provided with new and strong canvas saps for picking the ore on San Pedro. It is expected that they will return in about a month." But the call of yesterday says: "The steamer went, but the workmen didn't go; they were on hand, but no one appeared to pay their passage, and it is said, also, that the reputed owner of the lead has not been seen for two days, though large sums of money have been paid for interests in the mine. Some men are who think that those who bought have been sold, and that the mine is a fraud. The statement made quite a sensation. . . . It is affirmed that a coal vein has been discovered in Calaveras county, near the road to the Big Trees, above Railroad Flat, by a party of prospectors in search after copper, which is believed to be extensive, and which tests satisfactorily. Capitalists are the fortunate discoverers, and no expense will be spared in the investigation. We shall be glad to learn any facts connected with the discovery. . . . Machinery for mills is still being shipped to Washoe, Mono and down the coast.

Tulare County.—Some one writes to the Visalia Delta from Cozo, as follows: "The valuable mineral discoveries have been made here, as rumor has it, of astonishing richness, as yet I am not posted and cannot speak authoritatively. The Rough & Ready lead, in which I believe you have an interest, has been found of immense size, say from twenty to fifty feet in thickness. The main lead has been sunk upon but a few feet, and is improving. The Company are working a spur of the main lead, with an arasta for gold, by this process the silver, which metal preponderates, will be lostless nature, the ore, the work of the R. & R. S. M. Co. is nearly completed. Some of the ore of your town. As assessment has been levied of 25 cents to the share and with few exceptions, has not been paid; this lead, as all others, requires labor to develop it, and considering the small force employed, is being prospected with energy; they look to the stockholders for their reward. . . . The country known by the general name of Cozo, is divided into six mining districts, as follows: Cozo, Sahara, Argus, Telescope, Russ and Washington, each having a code of laws for its government. The Washington district is the best known, which it reports are true, eclipses in wealth all the fabled riches of Aladdin's Lamp in the Arabian Nights. . . . A letter dated July 9th, in the Bulletin, gives an account of a recent visit to the Cozo mines. He says that portion of these mines visited by the party lies 30 miles northeast of Owens Lake, and is even more rugged and barren than that I have in my previous letters attempted to describe, both grass and wood being very scarce, and water almost entirely wanting. Quartz veins, exhibiting gold and silver, are numerous, yet none of decided value have yet been found. Some of the rock was worked last year with arastras, but it did not pay. At present there are some 50 or 60 men in the district, and, although a great many claims have been taken up, but little work has been done; and no great amount will be, at present, owing to the feeble mineral indications, and the many disadvantages under which mining operations must be carried on. There is a kind of scaly sulphate there, which to the eye seems rich in gold, but does not yield well—being confined to the seams between the laminae, instead of being diffused through the rock generally. The quartz which is very hard, has a watery, glassy look, the mineral presenting more of the carbonate than the sulphate type. To the east of the Owens range the country is literally a desert, and, withal, so broken as to render travel over it very tedious. Yet there are mines there, and it is said, evidences of their having been worked at a former day.

Mono County.—A correspondent at Aurora, writes that "Mining is on the increase. Our little quartz mill is under full headway, crushing from 8 to 10 tons every twenty-four hours. The first crushed was some boulders gathered from the hill-sides, and they yielded about \$50 per ton. The next was rock from the Eten lead, on contract, which yielded \$3 per ton; the second was from the Golden Eagle lead, and yielded poorly; the third, from the Garibaldi lead, yielded about \$75 per ton. These were the yields in gold—but in all cases the rock yielded as much silver as gold, which was lost in consequence of having no saving process attached to the mill. Considerable change in business has been produced already by the operations of this one mill, and as a number of other prospects are here soon, great improvement is continually anticipated. Contracts for opening and developing ledges are being made every day, more expensive labor is being performed on them, and the owners are still more firm in the belief of their mineral wealth from the fact that the bottom of a silver lead has never been found. There are many chances for persons to acquire an interest in leads by taking contracts to run tunnels or sink shafts for a certain number of feet in the ledge. This is about the only means now to obtain claims without capital. Occasionally good ground is bought at 15 feet in thickness, and has a depth of 2,000 feet, and is sold to the different ledges in order to purchase safely. The gold and silver field in this district is very imperfectly known. It embraces an area of three miles square, and contains about five hundred different leads. Of all this number scarcely one can be found that gold and silver cannot be seen in the rock. It is like a harvest field, and supposed to contain more gold and silver than is now in circulation in the world. Take the Esmeralda lodge, for instance, which has 15 feet in thickness, and has a depth of 2,000 feet, and throughout its whole extent pays at the rate of \$500 per ton.

Sierra County.—The Sierra Citizens says: There is more extensive preparation going on, in this immediate vicinity, this season, than for many previous. In Downsville, above and below, the rivers are being flumed at every available point. There will undoubtedly be comparatively large quantities of ore taken out of the rivers, which will be marketed in Downsville. Success to the miners. . . . From the Messenger, we learn that the miners of Port Wine are continuing to do well, and that a half interest in the Eagle claims was sold, on July 1st, for \$9,000—wherein interest before held at \$20,000. A number of hands have been discharged from the Indian Queen claims, at Queen city, the stockholders being determined to run their diggings

with a lighter force than was formerly employed. . . . Morristown is not unusually lively. . . . Eureka city, noted for its hydraulic mines, is kind of quiet. The claims at Eureka have generally paid well this season, several of them having yielded enormously. A number of miners are at present engaged in cleaning bed-rock, which pays well. . . . Monte Cristo is very dead, and looks like a deserted village. The Gilbre Co. are taking out about 15 tons of lead, neither of them paying largely. . . .

Sierra County.—Correspondence from Snake River to the Democrat of the 13th, states that the miners along the river present a very busy appearance. Several wheels are already in operation. The Eleventh Co. are fluming the river at the lower end of the bar; they have some solid ground and expect to make a good thing. The Telegraph Co.—a bank claim—in a two weeks run, working 4 tons, cleaned up \$250. The Gilbre Co. are taking out about 15 tons of lead, neither of them paying largely. . . . At Iron Bar, a quarter of a mile down the river, three companies—The First Chance, the Ticket and Brandy Smith—have joined, and are damming the river for about 500 feet—each one expecting to do better than the other. . . . At Cox's Bar, three companies are at work, and are doing well; others are getting ready for work.

San Bernardino County.—F. Melius, Esq., had arrived at Los Angeles, with quartz crushing machinery. He is about to erect a mill at Lodi, which will have a capacity of twenty-five horse power, and the hoiler weighs about six thousand pounds. The work will be completed in the latter part of July. . . . The Patagonia District, says the Star, is the name of a mining district situated twelve miles from Holcomb Valley; it is ten miles square. A great number of veins of silver and copper have been struck. Mr. Cusbury was the pioneer of this district, having been the first to settle on the Desert side of the mountains. In April, a party of prospectors was journeying from Holcomb to Potosi, but striking a trail of what is called floating rock, prospectors for a vein, and found what they consider better than either Potosi or Washoe. There are from forty to fifty men in the district prospecting it; it is desirable for a mining camp, there being an abundance of wood and water. On the "Patagonia lead" the company are tunneling for silver; they have a thirty feet shaft and a tunnel 200 feet long, and expect to strike the vein in August. The tunnel is at a depth of 200 feet from the surface, and is now being completed. It is said that there are possibly heavily laden wagons. The prospects are generally most encouraging. From Mr. Cusbury we have received specimens of the ore. It looks well.

Los Angeles County.—We have encouraging accounts from the mines in the section of the State. The steamer Cortez, on her last upward trip, brought from San Pedro a consignment of two thousand pounds of silver ore, the richness of which is sufficient confirmation of the reported value of this mineral region. Various assays have been made of the ore of these mines, which are probably destined to become as celebrated as the mines of Potosi. Among the specimens received, are some from the Colorado claim, which assay \$1,500 to the ton; San Antonio, from \$450 to \$750. New Mexico, \$350; Mizentop, \$500, and outcroppings from the Mayfield claim, yielding \$87 to the ton. Arrangements are about to be perfected for carrying on these mining enterprises on an enormous scale. . . . From Los Angeles exchanges, we learn that the mines lately discovered on the Colorado river, keep up the estimates first formed of them. They are within four miles of the river. The gold turns out \$80 to \$90 per ton; and the silver ore has assayed from \$70 to \$110, this being top rock.

Amador County.—The Ledger learns from a gentleman residing at Lone City, that quartz veins have recently been discovered in the vicinity of "Pine Bluffs," which are rich and extensive. The country is known as the Mount Elsie district, and commences at the residence of Dr. Newton and runs to Dry Creek, a distance of ten miles. Both gold and silver are to be found on the route. A miner's meeting was held and laws passed, allowing 200 feet in length and 500 in width, on the lead, to the man. The law cannot be changed until three months notice is given in the County papers. The informant says there is a good deal of excitement about the diggings. . . . The place of the mine in which the main prospect is now being worked is pleasantly located, and the mines in the vicinity rich and extensive. . . . The copper mines of Amador are not creating much sensation, or we should have heard from them.

Siskiyou County.—The Siskiyou papers are barren of mining items. The only one we find is in the Yreka Journal of the 13th, which says:—With in the past four days not less than fifty persons have left this county for the Nez Perce mines. If the excitement continues the vote of this county will be considerably diminished by the first of September. Steady boys, remember Gold Bluff, Gold Lake, and Fraser River. "All is not gold that glitters."

Alameda County.—The Gazette, of July 13th, says:—"The prospect is that Alameda county will soon become the rival of Calaveras in the production of copper. A gentleman familiar with the business of copper mining has been for the past week prospecting the adjacent hills, and we are informed his researches have developed the existence of this valuable mineral in this county, but to what extent is not yet, of course, ascertained. Every indication affords assurance that besides our agricultural wealth, we are rich in mineral resources."

Nevada County.—Our accounts from this portion of our mines are slim indeed. The Transcript, speaking of Red Dog, says:—"The mining district is famous for the manner in which the main prospect is now being worked. We mentioned, some time ago, the extraordinary amounts washed out of some pans of dirt, and we are now informed, on reliable authority, that \$128 70 was washed out of one pan of dirt, taken from the claims of the Dutch Company. Messrs. Smith, Martin & Wahl are the fortunate owners of the claim."

Contra Costa County.—The coal veins in Contra Costa county are situated in a range of hills about fourteen hundred feet above the level of the sea. The original Cumberland tunnel is that from which the principal part of the coal has thus far been taken, equal to about 2300 tons. About 20 tons are taken out daily.

Calaveras County.—A Stockton paper says that Messrs. C. T. Mosher & Co. are shipping shipments of copper ore from the claims of the Union and Keystone Companies at Copperopolis, to the extent of about 600 sacks daily. The ore is destined for England, and forms a part of the quantity accumulated on the Levee, some 7,000 sacks, for the same destination.

Napa County.—Not a word do we find concerning the prospects or yields of the cinnamon mines of this county. The Reporter, however, notices the arrival in Napa city of the first flask of quicksilver from these mines. It was from the "Dead Broke" claim.

NEVADA TERRITORY.

Humboldt Region.—A letter dated July 2d, from Humboldt city to the Appeal, says: "The Humboldt mines are confined principally to one chain of mountains almost surrounded by low lands, the Humboldt river on the North and West, and an arm of the Desert on the East. The mountains are not more than about ten miles wide, ranging from the South, before we reach the crests is almost the summit of the mountain and the highest peaks. The country is divided into seven districts at present, but there will be no doubt be new districts formed soon. The inhabitants are very much scattered. I have many times seen my arrival here, I find that there are a great many quartz lodes in this range of mountains. I presume they will average twenty-five to a district, a great majority of which show galena in the croppings. I have located three lodes myself, all of which show mineral in the top rock. They have been but very few leads tested as yet; I have none thoroughly prospected. They have sunk on the "Sheba" about ten feet. There is a great deal of mineral in sight, but what it is I am unable to say. It is the prettiest range of mountains for mineral I ever saw. It seems to me that by a special act of Divine Providence, this range of hills has been poked up, either to make us all very rich or poor indeed. Nearly all the lodes run due North and South. There is not much timber, what there is of an inferior quality, being scrub-oak. The country is very much broken up, and the water in some of the creeks is almost too cold to drink. Provisions are very cheap, considering the distance we are from California. Flour can be bought for \$12 per cwt.; Bacon, 35 cents per pound; coffee, 37½ cents; sugar, about the same."

Washoe District.—The Washoe Times says:—"From actual observation, we find that there is at work and contracted for in this Territory, 51 quartz mills. When they are all in operation, they will not be able to supply the demand. . . . We understand that a quartz mill is being taken, via Howe Lake Valley to the Humboldt mines. . . . Messrs. Burk & Co., of Silver City, have just shipped 40 tons of gold and silver ore from the Henderson claim at Gold Hill, \$10,000 of amalgam. . . . Parties just in from Silver Hill report that there are about two hundred men

there prospecting in all directions. A town has been laid out there, an express line has been established between Virginia, Carson City and that place, and it is predicted by the denizens of that section, that it will, in the course of human events," become one of the best mining districts in the Territory."

The same paper says:—"We have been shown some very fine specimens of silver ore from the Silver Mountain Mines, situated near the head waters of the Carson, about fifty miles distant, and have heard the same water spoken of with great favor. These mines are entirely new and undeveloped, but we are of opinion that in a few months will demonstrate them to be among the richest in the country. The ore is as rich in appearance as any we have ever seen, resembling the Ophir very much. . . . Consignments of Washoe ore to this city are getting comparatively scarce."

OREGON AND WASHINGTON.

The most comprehensive and satisfactory account of the Nez Perce mine that we have seen, is contained in a letter to the Oregonian, from Dry Creek city, in that newly discovered gold region. The writer says: "I can now from actual observation, speak of many things that may interest the public. There are, on the Oro Fino and its tributaries, Quartz creek, Canal gulch, and Rhodes fork, etc., about 700 claims that will pay from eight to fifty dollars per day, to the land, when opened. About thirty are now opened and worked. The most of the remainder are in the Oro Fino Flat, and the entire interval from Washoe to the Oro Fino is covered with water, and much of it is of a low swamp. From all the numerous prospect holes that have been sunk, it would appear that the surface dirt to be removed will average two and a half feet, and the pay dirt five feet to the bed-rock, which is composed of rotten granite. The pay is mixed with sand, slag and quartz boulders weighing from one ounce to one hundred pounds, and more. This gold deposit is scattered or extends over a region of country of at least thirty miles in extent. It is a very fine, and as they call it, a very rich area, and the gold is more and coarser in leads and spots than in the creek bottoms. Exciting reports of the richness of some discoveries are in circulation here, the truth of which I cannot endorse. One thing, however, I will assert. I sincerely believe that on this stream and its tributaries, there are ten or twelve sections that will average one dollar to the square foot of surface, that is five square feet of pay dirt, as that is acknowledged to be the average depth of 150 to 200 feet. Now, from him we learn that there are three counties, and while running a good sluice, will produce \$30 per hand, each hand paid to sluice 1,000 pans or 144 square feet. I would here remark that this sluice washing is but little more than half the labor of pan washing, and that after the claim is opened, the fair estimate is about \$15 per day to the hand, with hard work. Rhodes creek, I think, will average much higher, say 5 or 6 cents—3 cents per pan average will give \$1 per square foot, or \$37,500 to the claim of 150 or 200 feet. The average size of mining lots is now, you may say, that these mines are no temporary discovery, that are to last only a season, but years will not exhaust them. These persons, however, who expect to make fortunes in a day here, will be sadly disappointed. I believe there is more gold here than in California; but it is covered with a much heavier coat of decomposed vegetable matter, and more universally scattered than it is there, so that 'great strikes' as they are called, will be seldom made; and those that come here to pick up a fortune in a few days, without work, will go home with empty pockets. The population of the entire country of this region now, at about two thousand. A majority have not yet secured claims; probably five hundred are prospecting, and three or four hundred working by the day at four dollars per day with board, and five dollars without. Trading is overdone. I think goods and groceries are falling in price. . . . The Yreka Journal says, that Mr. Win. Rhodes, an old citizen of that county, returned, a few days since from the Nez Perce mines, bringing with him some 100 ounces of gold. He says that he has seen some of the richest gold he has ever seen, which will average from \$5 to \$15 per day to the hand. He thinks the diggings extensive, and so far as prospecting, believes they will yield flattering returns. The gold is fine, and assays about the same as Oro Fino dust, in this country—\$15 25. He thinks there are about 5,000 people in the mines, but like all other placer diggings, a great many are doing nothing, simply because they are too lazy to work. Mr. R. and partner took out \$8,000 in 35 days, but he does not mean to leave the place, as he has a large family, and will, and willing to take the chances, might do better by going there. Mr. R. intends returning in a few days to work out his claim, only having returned to settle up his business."

MEXICO.

From a private letter just received from Guaymas, which has found its way into a city contemporary, we take the following interesting extract: "The mines (of Suora), at this season of the year are not the least account, although one can obtain the 'color' most anywhere, but water there is none for miles around to wash out even a pan of dirt with. In fact the only river in the State which has been navigable, or to contain a running stream, until a few days since, was the Yaqui river. Even this river, as a result of a party composed of the American Consul and others, started out a short time since to explore it, but returned after a week's absence, and reported it as perfectly dry for a distance of some fifty miles above its mouth. This surprises every one, as at San Antonio, one hundred miles further up, there is about a three feet stream of water. The water is supposed to be absorbed in the dry sands of the river as it progresses down, until the last top disappears miles above its mouth. When the rainy season sets in, a man may make a couple of dollars per day, perhaps; I hope so, at least, as it may be my only chance of getting square. Those of the Mexicans who are engaged in mining, at the few places where water is extant, make only from two to three bits per day each, so you see that it is not so rich as you are made to believe it is at San Francisco by the letter writers for the Bulletin and other papers, who do not stir out of Guaymas, but who, nevertheless, date their letters from all quarters of the State, dishing up what rumors they hear as facts within their own observation, and at the rate of \$10 or less per letter. As for quartz mining and silver leads, there is no doubt but there are many good chances for a fortune, as in all mining countries, but that they outnumber the chances of one's failure therein, is a preposterous idea, letter writers to the contrary notwithstanding. There are, however, many good leads—some of them were worked a century ago, and would cost a fortune to re-open again. Some few have been recently discovered, but they are few and far between, and one can tell, I mean, by the time you receive this, be interested in one of them, but how I will manage I know not, as the law here requires a shaft to be sunk thirty feet deep and six feet square within four months, in default of which the claim becomes forfeited. I intend to prospect the claim at least, if I can obtain jerked beef enough to live on in the meantime."

Zacatecas.—The traveling correspondent of the Bulletin writes thus concerning the Salt works of Cuynatlan, in this Mexican State:—"These salt monopolies were formerly (most of them were sold by Santa Anna, who sold everything he could find purchasers for, a source of great revenue to the Government. That of the Penon Blanco, near this city, is probably one of the most magnificent speculations in the world. The salt, which is produced to the amount of about 100,000 tons annually, may be said to cost literally nothing, as all that is required is hauled up by a single mule. The demand is immense, and the price on the ground \$40 per ton. The residence of the clerks and superintendent is a regularly fortified castle, with moat and drawbridge, defended by a few soldiers, and the mule train is guarded by armed soldiers, splendidly armed and equipped, as a defense against robbers. It is a perfect milk cow business for the patriots. Vidaurri was thoro not long since; he was treated like a prince, and he and his suite drank up over \$10,000 worth of the fine old wines in the cellar before leaving. The last call made was by the celebrated General Gonzales Ortega, patriota finisimo, who requested the loan of \$50,000, at sight. The administrator protested, when the brave Ortega gave him the alternative of forty days' military service, or being hanged on a gallows; and he was actually on his knees when he gave in to handing over the keys, and told them to help themselves to what they liked. They very modestly contented themselves with the \$50,000."

BRITISH COLUMBIA.

We have been shown by Mr. Rose, of Victoria, V. I., says the Port Townsend Register, of July 3d, some very rich specimens of silver ore obtained from a mine recently discovered in British Columbia. It exceeds in richness any yet discovered in Washoe. The mines are not as difficult of access as those of Washoe, nor is the locality infested with tribes of savage Indians, as that country seems to be. British Columbia, between her rich auriferous deposits in Cariboo and the adjoining country, and her silver mines to boot, will soon enter into competition with California. We would not, in consequence, be surprised to hear of a sudden influx of a large number of miners from California, and the numerous as that of '83 to Fraser river. The Otter has arrived at Victoria, July 1st, with \$12,000 gold dust, transmitted by Express, and a large amount in private hands."

PURIFYING WATER FOR SOLDIERS.—During warm weather, soldiers in camp and upon the march frequently can obtain no other kind of water to quench their thirst and cook their food than that of ponds, rivers and brooks. These waters are frequently charged with organic matter, which is liable to produce dysentery, and in many places, cholera. Soldiers should therefore become intelligent, so as to provide for every contingency in war. The preservation of their health should be just as carefully guarded to ensure efficiency, as good discipline and a supply of ammunition. A few words upon impure water may therefore be of great advantage to many of them, and possibly may be the means of saving many lives.

The organic impurities of water are partly of animal and partly of vegetable origin, both of which are very objectionable, but the animal most of all. These impurities are constantly undergoing chemical changes—a fermenting process—and it is during such a state of change that the water is dangerous; because, when taken into the human system in this condition, it tends to engender the same fermenting action. The nature of this action is not well known, but of the fact there can be no doubt. Rapid running streams, even if they are as brown with mud as the Mississippi river, and as much charged with organic matter, are perfectly healthy, because no chemical change—no fermentation—takes place in them. Sluggish streams and stagnant pools are most to be dreaded. The mud may be filtered from the water of a running river by merely passing it through a cotton cloth, a piece of blanket, or flannel, and we should advise soldiers to do so in most instances. This simple method of straining water will also be found a partial safeguard for stagnant water, but not a perfect one. When on march, soldiers should endeavor to endure thirst with fortitude; and when they rest for cooking their food, they should boil the water which they intend to carry with them for drinking. When cooled and agitated in the air for a few moments so as to absorb oxygen, it becomes quite pleasant to drink.

Natives of the East Indies who live in flat alluvial districts, where the ponds and rivers are sluggish and charged with organic substances, boil the water for drinking and allow it to stand over night. This process, they say, prevents them from taking cholera. The reason is evident to a man of science: the high heat of boiling destroys the fermenting action. Let the soldiers therefore be careful to boil and filter the impure water which they, of necessity, are compelled to use.—*Scientific American*.

GAS GENERATING STEAM BOILER.—A gas-generating steam boiler has been invented, which appears to possess some peculiar features. The plan consists in combining one or more retorts with a steam boiler, in such a manner that the same fire which is employed to convert the water in the boiler into steam also heats the retorts, and by introducing certain materials into these retorts, steam and illuminating gas are produced simultaneously. There is an arrangement of a series of gas pipes and air holes, in combination with an additional fire chamber, situated in close proximity to the ordinary or main fire chamber, so that by the action of the gas and air thus introduced into the secondary fire chamber, the smoke and other combustible gases escaping from the main fire chamber are consumed and an additional heating surface is obtained. There is also employed a three-way cock, in combination with a conical vessel having a conical bottom, the plan being such that the oil and water used for the manufacture of the illuminating gas are mixed before entering the retort. With this three-way cock are combined two gasometers and a series of levers, with weights or springs, so as to regulate the supply of oil and water to the retorts.

CULTIVATION OF SORGHUM.—Seymore Carver, of Wisconsin, writes:—“Plant as early as the ground will admit, and not cover your seed too deep—not over an inch. Last spring I sprouted my seed by putting it in a tin pan, wet it with warm water and covered with a flannel cloth; kept it in a warm place two days, and very near every seed was sprouted. Planted immediately, and in three days, half of it was out of the ground. I had a small quantity of seed get ripe; but none to be relied on, and don't know of any in this section. The time for working up the cane is just before the frost, and I don't think freezing hurts it, unless it comes off warm and sours it. I don't use anything to clarify the juice; but skim well.

PEACHES.—This delicious fruit, says the *Appeal*, is now coming forward quite rapidly, the late warm weather having ripened the early varieties at once. They are much cheaper than usual at this time, being at twenty cents wholesale for the best, and as low as six cents for the less desirable qualities. The fruit-dealers and fruit-growers complain of the bees which trouble them exceedingly by breaking the peach-skins and drawing nutriment therefrom to the disfigurement of the fruit.

SINKING WELLS ON THE DESERT.—Mr. Asa S. Kenyon, of Ragtown, we understand, is sinking wells in the middle of Twenty-six Mile Desert, for the convenience of travelers and immigrants. He certainly deserves much credit for this enterprising undertaking, and when he has them completed travelers can cross that arid waste as well in the day as in the night time.—*Washoe Times*.

NAVIGATION OF THE MOKELUMNE.—A small steamer has recently made her appearance at Mokelumne City, with the view to plying in the regular trade between that point and San Francisco.

THE BENSLEY WATER COMPANY.—The semi-annual report of this company states that, three Reservoirs have been constructed—one containing 4,500,000 gals., another capable of holding 8,000,000, and the smaller, 3,600,000 gallons. The pumps now in operation are capable of drawing to the reservoirs 2,000,000 gallons daily. The length of pipe laid exceeds 22½ miles. The average consumption of water for the past year has been 500,000 gallons daily, and now reaches to 700,000 gallons daily. The number of consumers is over 1600. The company supply free of charge the Roman Catholic Asylum, Catholic School and the Denman School; also as per agreement, the City Hall, County Jail, Hall of Records and 193 fire hydrants. They complain of a waste of water by the latter. Since the introduction of water in the city, the rate of fire insurance has been reduced from 2¼ to 1½ per cent. The complaints in regard to the quality of the water have arisen from local causes, which have been removed as soon as known. They are making all efforts to render the water pure in every locality and at all seasons. The expense of the work has reached the sum of \$842,729 35.

FROST.—A recent frost in Indian Valley, Plumas county, has injured gardens and wheat crops.

A. KOHLER,
NO. 178 WASHINGTON STREET, SAN FRANCISCO.

Forty Cases of Musical Instruments Just Received,

Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS.
Also, TAMBOURINES, BANJOS, FIFES, FLUTES, CLARION PICALOES, VIOLIN BOWS, BOW-HAIR, ROSIN BRIDGES, PEGS, TAIL PIECES, FINGER BOARDS, TUNING FORKS, SSS ROMAN STRINGS (four lengths and four thread), and

ALL KINDS OF MUSICAL INSTRUMENTS,

Fresh every two months from Italy.

All of these goods will be sold to the trade, as they are direct importations from the manufacturers of Europe, and imported in large quantities by A. Kohler. He will sell them twenty per cent. cheaper than any other house in California; therefore it would be the interest of all to call and examine before purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by the case.
C2.—The wholesale department of this House is on Sansome street, occupying the whole block from Clay to Commercial street. mh5

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Potosi, \$175 per share.
Central, \$625 per share.
Ophir, \$1000 per share.
Gould & Curry, \$225 per share.
Chollar, \$15 per share.
Lucerne, \$20 per foot.
St. Louis, \$4 per foot.
Mount Davidson, \$60 per share.
Mark Anthony, \$8 per foot.
Louise, \$18 per share.
Bradley, \$5 per foot.
Sacramento, \$10.
Shelton Co., \$3 per foot.
Josephine, Flowery, \$10.
West Branch, Flowery, \$7.
Harrison, Flowery, \$12.
Yellow Jacket, \$25.
Exchange, East Comstock, \$40.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$16.
Ohio and Buckeye Co. Argentine, \$12.
Chimney rock, \$15.
Dargen, \$10.
Rich Co., \$3.
Miller, \$12.
Augusta, \$6.
Spanish Co. Plymouth Ledge, \$6.
Chelsea, \$8.
Caney Ledge, \$25.
King Charles, at Flowry, \$6.
Edgar Co., Great Western Ledge, Geleaa, \$20.

Number of Shares to the Foot.
Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.

[Having completed all the requisite arrangements, we lay before our readers a reliable list of prices of mining stocks of Utah.]

NOTICE.—THE GENTLEMEN OF SAN FRANCISCO ARE RESPECTFULLY informed that their NEW BILLIARD SALOON, with EIGHT FIFTY CLASS PHELAN'S TABLES, will be opened for business on SATURDAY, 29th, 1881. The undersigned respectfully solicits the patronage of all BILLIARD PLAYERS, and hope by conducting their Saloon in an unusual manner, to merit their continuance and support.

WHEELER & WILSON'S

FAMILY SEWING MACHINES!

NOT ONLY

THE BEST FOR FINE SEWING,

...BUT THE BEST FOR...

MANUFACTURING CLOTHING

...AND...

OTHER HEAVY WORK.

SAN FRANCISCO, June 6, 1881.

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, Cassimere and Tweed Suits, etc., from materials made at the Mission Woolen Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them can not be surpassed.

Various styles of Machines have been employed on the above materials but the Wheeler & Wilson is preferred.

DONALD McLENNAN,
Proprietor of the Mission Woolen Mills.

July 6

NEW METHOD OF PREPARING FLAX.—The trouble about supply of cotton is causing the world to think sharply about flax, for the preparation of which an important discovery has lately been made. The New York Post says:

As long ago as 1828, a patent was granted by Act of Parliament to a Mr. Lee, for a method of separating the fibre in two or three hours. In 1852-3, a Mr. Schlenk invented a method for preparing the fibre in sixty hours, and the Chevreau-Chausson introduced, still later, a process by which the flax is soaked in the solution of carbonate of soda, and afterwards dipped in a weak acid solution, came out broken up to its minutest divisions, and in the form of flax cotton, and when manufactured proved to have a stronger and finer texture than the best cotton. For some reasons unknown, the discovery was not proceeded with; at cotton still remained king; but we believe its downfall is at hand.

On our great western prairies, and in a large part of Western Canada, there is a species of wild flax, unknown to botanists formerly, which is indigenous, perennial, herbaceous, and inexhaustible in quality. It was put to no use by the early settlers, except to make straw of it for litter. Recently, the seed has been considerably collected for the manufacture of oil, but still later, its fibre has been found to be very valuable, and now it has assumed a momentous importance through the means of a very simple invention. The stalks are placed in a cylinder and subjected to an enormous pressure of high steam—220 pounds to the inch. In less than a minute the contents are blown out or exploded, and the fibre comes forth with the fibre, divided up, and the husk or covering shattered into infinitesimal parts. It then resembles cotton or tow. It is next passed through the cylinders armed with teeth, which hackle it and smooth out the fibres. It is then washed with nitric acid, and comes out as white as snow. It is then carded, drawn out into yarn, and is spun to thread precisely like cotton, and is ready for the loom. Thus the old, tedious and unhealthy process of water rotting is done away with, and so is that of bleaching, to perfect which chemistry has exhausted itself, and large fields of lawn have been indispensable.

This article, when ready for spinning can be afforded at a uniform price of six cents per pound, and enough of it can be gathered wild—though it will be much improved by culture—from our own prairies, to clothe the world with a fabric of no finer and most desirable quality. The experiments already made, and the mills already constructed to manufacture it, have furnished the most conclusive evidence of the truth of this magnificent discovery.

Samples of the article, in all its processes, have been forwarded to Manchester, and parties are ready to furnish as many bales of it as all the mills in England may demand.

Thus Providence seems to step in at a critical moment to destroy the value of the staples on which Secession has placed its greatest reliance for its means of support, and for the attainment of foreign alliances.

WHAT A VOLCANO CAN DO.—Cotopaxi, in 1738, threw its fiery rockets 3,000 feet above its crater, while in 1744 the blazing mass struggling for an outlet, roared so that its awful voice was heard a distance of more than six hundred miles. In 1797, the crater of Tunguragua, one of the peaks of the Andes, flung out torrents of mud which dammed up rivers, opened new lakes, and in valleys of a thousand feet wide, made deposits of six hundred feet deep.—The stream from Vesuvius, which, in 1737, passed through Torre del Greco, contained 33,600,000 cubic feet of solid matter; and in 1794, when Torre del Greco was destroyed a second time, the mass of lava amounted to 45,000,000 cubic feet. In 1679, Etna poured forth a flood which covered eighty-four square miles of surface, which measured one hundred million cubic feet. On this occasion, the scorific formed the Monte Rossi, near Nicolosi, a cone two miles in circumference and four thousand feet high. The stream thrown out by Etna in 1810, was in motion at the rate of a yard per day for nine months after the eruption; and it is on record that the lava of the same mountain, after a terrible eruption, was not thoroughly cooled and consolidated ten years after the event.—In the eruption of Vesuvius, A. D. 70, the scorific and ashes vomited forth far exceeded the entire bulk of the mountain; while in 1660, Etna disgorged more than twenty times its own mass. Vesuvius has thrown its ashes as far as Constantinople, Syria and Egypt; it hurled stones, eight pounds in weight, to Pompeii, a distance of six miles, while similar masses were tossed two thousand feet above its summit. Cotopaxi has projected a block of 109 cubic yards in volume, a distance of nine miles, and Sanbawa, in 1815, during the most terrible eruption on record, sent its ashes as far as Java, a distance of three hundred miles surface, and out of a population of twelve thousand souls, only twenty escaped.

NEW SILVER MINING COMPANY.—The certificate of incorporation of the Amargosa Gold and Silver Mining Co., has been filed in the County Clerk's office. The field of operations of this company will be in the Washington District, Tulare county. The capital stock is \$1,200,000, in 1,200 shares of \$1,000 each.

ASIATIC RESEARCH.—An expedition into Central Asia has been undertaken by Captain Thomas Blakiston, of the Royal Artillery, and another gentleman, who are sanguine of obtaining a store of information regarding that almost unknown country.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our better equipped establishment, we can confidently announce to the public that we now have

The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp Shoes and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Milling Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Muley, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines has been in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Sinal Mills; Boiler Fronts; Wind Mills; of Hunt's, Johnson's and Lam's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to.

Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before?" It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe.

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work. The high estimation by which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
- 2d. Having two driving wheels, if one slips the other does the work.
- 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
- 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
- 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
- 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
- 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
- 8th. The cutter bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
- 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
- 10th. It has no side draft.
- 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchasing. KNAFF, BURRELL & CO.,
ap19 310 (Old No. 80) Washington street, near Front, San Francisco.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Munn & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interests of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a rejection, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as a gentleman of large experience in such matters, of prompt and accurate business habits and of unimpaired integrity. As such I commend him to the inventors of the United States.

Southern Pacific Railroad.

In the *Estrella de Occidente*, the official paper of Sonora, Mexico, of March 29th, is published an Act of the Congress of Sonora, granting the right of way for a railroad through that State, with most liberal guarantees and exclusive privileges of every description. Large tracts of land are donated, and exemption from all classes of taxes and duties, in fact, every encouragement that was in the power of Sonora to extend has been proffered toward the building of this railroad to the Pacific. The passage of this most important act is mainly due to the exertions of Gen. Trias, ex-Governor of Chihuahua, who has spent more than a year in Sonora laboring to bring about this end. We give the most important provisions of this act:

Authority is given by the State of Sonora to Gen. Trias and the company of Mexicans and Americans formed in New York which he represents, to build a railroad from any point on the boundary of the State with the United States or the Northern limits of Chihuahua, and the port of Guaymas or any other port of Sonora on the Gulf California. The route between these termini shall be such as may be deemed as the most practicable by the engineers of the company, subject to the approval of the Governor.

All the necessary materials on public lands necessary for the building of the road, are granted to it free of charge. The owners of lands whose lands are taken or injured by the road shall be indemnified, in accordance with the laws appropriating private property to public uses.

All materials for the use or construction of the road, or for the use of the employers and workman, whether national or foreign, shall be free of dues or duties of the State during the construction of the road. From the day of the completion of the road, for the space of 25 years, it shall be free from taxes. The employees of all classes, while in the service of the company, shall be exempt from military duty, except in case of foreign war.

The company are granted one-half of all the public lands within one league of the road on both sides thereof on the whole length of the road. They are granted all mines of coal and salt which they may find on the line of the railroad and all springs of water they may find in their excavations. They are granted full privileges to construct houses, docks, etc., for the purpose of receiving, warehousing, and embarking their freight.

They are granted the privilege of building a line of magnetic telegraph on the route of the railroad, all the messages of government to be sent free.

The company may hypothecate the road and all the privileges herein granted for the benefit of the road, by the consent of the Governor.

The company shall transport all the troops, employees and freights of all descriptions for the Government, at half the usual rates of fare.

The company shall complete their plans and explorations, and determine on the route of the road, within eighteen months from the passage of this act. The company shall build within four years from the passage of the act, complete five leagues of the road, or in failure thereof, to pay a fine of thirty thousand dollars.

No railroad shall be built within thirty leagues of the present route.

FOREIGNERS INVITED TO MEXICO.—As an inducement and guaranty to emigration under date March 13th, President Juarez issued an important decree inviting foreigners without distinction to settle in Mexico additional to the privileges and guarantees already established by law. The provisions are substantially as follows:

1st. Any foreigner who may purchase land for homestead purposes shall be exempt for five years from public taxes of all kinds.

2d. Any foreigners or company who may purchase land for the purpose of establishing thereon a colony shall be exempt for ten years from every description of taxes, except such as they may impose upon themselves as municipal dues.

3d. The foreigners embraced in the two foregoing articles shall enjoy for five additional years the said privileges, provided they are able to show at the expiration of said terms that they have employed one third as many Mexicans on their lands or colonies as they have laborers or colonists.

4th. During two years they shall be exempt from duties of importation and all other duties on all articles of merchandise directly consigned to them for the use of said colonies or for the prosecution of their agricultural pursuits.

5th. The colonies which may be thus established with foreign capital, may dispose as they think proper of any municipal revenue they may create.

6th. Lands cultivated and colonies thus formed, so far as the fulfillment of the guarantees thus offered, as also by the Constitution of the Republic, shall be entitled for two years to claim the protection as foreigners, according to the nationality of the owner of the land so acquired or in case of a colony, according to that of the majority of the colonists.

SEED WHEAT FROM THE PATENT OFFICE.—The Secretaries of the Mechanics' Institute have received from the Patent Office in Washington, a number of packages of seed wheat, which will be distributed to farmers who may wish to experiment with the seed. There are several varieties, consisting of the "Noe," "Poulard," and "Common Rivet" from France, the "Red" wheat from Italy, and "Flint" wheat from Algeria.

PHELAN'S BILLIARD SALOON.

THE ABOVE BILLIARD SALOON, WITH EIGHT FIRST CLASS PHELAN TABLES, is now open to the public. The cushions on these tables are the latest patent, and are a great improvement on their predecessors. The room is fitted up so as to combine ELEGANCE with COMFORT. The bar will be kept constantly supplied with the very choicest brands of

WINES, LIQUORS AND SEGARS,

And the subscribers hope, by strict attention, to merit the patronage of all who admire and practice the GAME OF BILLIARDS. DAN LYNCH, 720 Montgomery st. op. Metropolitan Theatre. M. E. HUGHES.

The subscriber begs to inform the public that the above mentioned Billiard Saloon is also intended to serve as a show and salesroom for

Phelan's Patent Combination Cushions and Model Billiard Tables,

And Billiard Trimmings of every description. Parties desirous of purchasing Billiard Tables will thus have an opportunity of selecting from a varied assortment, both in style and finish, and can also test the superiority claimed for the Cushions and Tables. Mr. DAN LYNCH will always be on hand, and ready to give all required information with regard to the merits of these JUSTLY CELEBRATED BILLIARD TABLES. The subscriber cordially invites all interested parties to call and examine. M. E. HUGHES, Agent for Phelan's Patent Combination Cushions and Modern Billiard Tables

BERGER'S BIJOU BILLIARD TABLES,

With PHELAN'S PATENT COMBINATION CUSHIONS.

The subscriber desires to inform the public that he has now on exhibition at

Phelan's New Billiard Saloon,

Montgomery street, opposite the Metropolitan Theatre one of the above mentioned BILLIARD TABLES, and cordially invites the patrons of the noble game to call and examine it. The Great Master, Mons. Berger, speaks of the Tables in the highest terms of commendation. To private families these Tables commend themselves, especially on account of their convenient size, and as an article of furniture for a private dwelling there is nothing more desirable; in short, no boudoir or mansion with any pretensions to being well regulated, should be without one. Gentlemen about to build residences should by all means make provision for a BILLIARD ROOM, where their family can enjoy the noble, graceful, and health-giving game of Billiards.

M. E. HUGHES, Billiard Table Manufacturer, and Agent for PHELAN'S PATENT COMBINATION CUSHIONS, etc., etc. Exhibition and Salesroom, No. 720 and 722 Montgomery street. Manufacturing, Market street, opposite Orphan Asylum. jy13

PETER DONOHUE'S UNION IRON WORKS.

The above illustration represents the "Union Iron Works," owned by Peter Donohue, Esq., and situated on the N.E. corner of First and Mission streets. These works were established in 1849, and have had unexampled prosperity ever since. Ninety-five workmen are employed. To describe the machinery and various departments as they deserve, would fill our paper. We therefore content ourselves by stating that the works contain all the latest improvements in machinery, and are capable of supplying all demands for boilers, machinery and castings, no matter how large or complicated. In these works, Steam Engines are built and repaired; Quartz Mills, Grist Mills, Threshing Machines, Horse powers, Grist Mills, Gearing and Milling are made; all kinds of mill work, steamboat repairing, blacksmithing, etc., done in the best possible manner; and it is here also that Donohue's "Safety Steam Pump and Fire Engine" is constructed. It is admirably adapted for mining purposes, whether for quartz machinery or for forcing water from shafts. Every description of iron castings for buildings also made here.

"FAST" PEARS AND PEACHES.—The Marysville *Appel* says: At the garden of Mr. Gooddell, on A street, is a dwarf pear tree set out four months ago, which has upon it several large, ripe pears, also a number of half formed, well shaped pears, about a month from the blossom, while the top of the tree is surmounted with clusters of blossoms some of which are just forming into fruit. There are three distinct stages of progress from the blossom now visible on the tree, and if anybody can beat that we are anxious to hear from them. We cannot let the reader off without one more story, just tough but just as true as the other. On breaking open a peach yesterday, we discovered that the kernel had burst out of the pit of the peach, and had actually pushed out two tiny, green leaves, which were *en route* for a small hole at the bottom end of the fruit when arrested. Can anybody else go ahead of that time?

NEW FOUNDRY.—A new and large iron foundry has been started in Grass Valley.

FINANCIAL.—California State bonds were at last accounts, selling in New York at 76¼ cents.

WOOL GROWING.—There are few pursuits so remunerative as wool growing. We trust that our farmers will not only think of it, but go to work immediately.

CHINESE TABLE-TURNINGS.—Even table-turning and spiritual manifestations are not unknown to China. In this, as in many other things, they are in advance of the practitioners among ourselves. The mode of carrying on this operation is somewhat different from that in vogue in the United States. The table is turned upside down upon a pair of chop-sticks laid at right angles over the mouth of a mortar or bowl filled with water. Four persons lay one hand upon each leg of the table, while the other clasps the free hand of one of the four, and thus the circle is completed. An incantation is now chanted by the "medium," as soon as the table begins to move. The "circle" move with it, and in a minute it is whirling upon its axis, until it is thrown off its balance, and falls upon the floor. The motion of the table is universally attributed to supernatural agency, but it seems not to have been used as a means of communication with the spiritual world.

There is no necessity for resorting to so clumsy a method of communication with the dead. The spirits have been induced to write their communications. A table is sprinkled with some kind of powder, or flour, or bran, or dust. Then a small basket, without a handle, is armed with a pencil or a chopstick, which is tied to its edge, or thrust through its interstices. The basket is then turned upside down, its edges resting upon the tips of one or two fingers of two persons standing on opposite sides of the table, and in such a manner that the pencil touches the powdered surface. In a short time the pencil moves, leading after it the basket and the fingers on which it rests, and tracing upon the dusty table lines and figures in which a good linguist easily recognises the characters of the Chinese language. In this way information is communicated on subjects of which the operators have no knowledge. Sometimes, indeed, a ghost thus invoked may be unable to write Chinese, or may be unwilling to exercise its powers, and then nothing can be discovered but unmeaning lines and angles. But in general the composition is good and the information valuable.

SILVER LAKE VALLEY.—At this summit valley, in Amador county, says the *Dispatch*, fishing is fine, and the number of stock feeding there is 20,000 cattle and 15,000 sheep,

TELEGRAPHIC APPARATUS.—Several improvements in the operation of the Morse telegraph have recently been completed in England. One by the Brothers Digney marks the characters with ink, instead of simple indentation in the paper. This is a relief to the eyes of the operator, and an additional guaranty of accuracy. It is accomplished by making immovable the instrument for tracing, which is a simple desk turning upon itself; the lever, moved by electricity, has no other function than to press the paper against the desk at divers intervals and for different lengths of time. By a clockwork movement this little desk rubs constantly against an elastic roller saturated with a fat ink, which long preserves its fluidity, so that it suffices to put a few drops of it every two or three days on the surface of the roller. This method has been quite extensively adopted.

Mr. Wheatstone, of England, is also the inventor of a convenient process for increasing the speed of transmission by the Morse instrument, similar to a process for the same purpose connected with the Bain instrument. A prepared paper is punched with holes corresponding to the Morse characters, and the message thus prepared is placed on a moving metallic band, and is made to take the place of an operator and transmit itself.

Another improvement which may here be named, is that of telegraphing by sound, thus dispensing with the local batteries of the House system. The magnet and armature are placed in the main circuit, and by a simple combination of sounding board and over-strung wires the indistinct tick is expanded to a clear, sharp, and perfectly intelligible knock, which the operator can follow with entire ease and certainty. Each knock is loud and abrupt, and there is not the slightest liability of running them together, however rapid the manipulation of the operator.

RAILWAY IMPROVEMENTS.—An improvement in the permanent way of railways is noticed in the English journals. According to this plan, it is proposed to make a portion of one or both of the rails at the point or change of line slide along horizontal parallel slots made at an angle to the rails, the two ends of such sliding rails, and the ends of the stationary abutting rails being inclined or bevelled to correspond to the angle of the slots, whereby an overlap bevel joint is obtained. When one of those sliding rails is used, the pointed swivel switch rail remains unaltered in shape, and is coupled with the opposite switch rail in the ordinary manner, but the latter rail end is bevelled in place of being cut square off. To this latter rail is fitted a slide which is connected with that portion of the rail which works in the parallel slots, so that on the slide being moved by the lever which opens or closes the switch, it carries with it the loose rail, and causes it to travel in its parallel slots and change the points accordingly. When two sliding rails are employed, one for each side of the way, they are coupled together and move in their slots simultaneously, the ordinary swivel switch rails being in this case dispensed with. On the first bevel end meeting the train—the switch being right for the main line—there is a rigid stop for maintaining the rail firmly in a permanent line. It is also proposed to combine, by means of rolls, a T-shaped steel bar, with two wrought iron L-shaped or angled bars, so as to produce an L-shaped rail, with the steel rail in the centre, and forming the wheel-bearing surface. The parts may be further secured by bolts and rivets; and the T-shaped rail may also be rolled with obtuse-angled rails, of wrought iron, one on each side, so as to form a rail suitable for the saddled-back sleeper, and having a steel wheel-bearing surface. The wheel-bearing surface of the ordinary double-headed rail is, according to the plan proposed, to be covered with a layer of steel.

NEW BRIDGE.—A Wire suspension bridge is to be built across Klamath river, three miles below Weitchpeak.

MODES OF PLACER MINING.*

Hydraulic Mining.

(Continued from our last.)

"Hydraulic mining" is that mining where a stream of water led down from a considerable elevation through a hose, is thrown by the pressure with great force upon the dirt, which is thus loosened, dissolved and washed down the sluice. The hydraulic power is used to save digging with shovels, to remove the dirt and dissolve it more quickly than could be done in a sluice. "Hydraulic mining," as it is called, is not a process of washing dirt, but of preparing it for washing. The dirt of all hydraulic claims is washed in sluices. The force of the hydraulic stream, sometimes under a pressure of two hundred perpendicular feet of water, is so great that, if it should strike a man, it would kill him instantly; and striking a bank of dirt, it tears it down more rapidly than could two hundred men with picks and shovels. The hydraulic can be used to advantage, only, where there are deep placer diggings, with a channel to lead away the water from the bottom of the claim and where an abundant supply of water can be obtained at the surface of the claim. In such places, a reservoir for water, sometimes not containing more than a hundred gallons, is placed at the top of the claim, and a hose of heavy cotton or linen duck leads from the reservoir to the bottom, where the water is thrown from the pipe against the earth, near the bed rock, and that being washed away, the bank above comes tumbling down in great masses, sometimes hundreds of tons at once. The stream of water not only tears down the bank, and carries it to the sluice, but dissolves much of the dirt before it enters the sluice. The amount of dirt that can be washed with a hydraulic depends greatly on circumstances, such as the amount of water, the fall, the character of the dirt, and the season. In winter more dirt can be washed than in summer; because the earth is then wet through, and dissolves much more readily. Tough clay is very stubborn; sometimes lumps of it, a foot or even two feet in diameter, will roll through the sluice, carrying off much gold and amalgam, which they have rolled over and caught in their course. Large boulders, in some claims, interfere greatly with the progress of washing; these cannot be laid to one side, but must usually be sent down the sluice, either entire or in pieces, after being broken up with bammers. The amount of water used in a hydraulic claim, is from forty to three hundred inches.

Hydraulic miners have had much difficulty with their hose; for the strongest duck and leather would not hold more than about eighty perpendicular feet of water, and would be worn out after a few months of use. The latest mining invention, called the "crinoline hose," is to surround the hose with galvanized iron bands, which are about two inches wide, and from one to three inches apart. These bands are connected together by four ropes, which run longitudinally from one band to another. The crinoline hose will support a head of water more than twice as high as that of a common hose.

(To be continued.)

MACHINERY FOR TREATING COTTON.—An improvement has been made in cotton gins, which consists mainly in two endless belts passing around two driving rollers, thence around two sharp-edged guides, coming in near contact with each other, borne together by a spring or weight. The bite of the small rollers as they revolve takes hold of the cotton as it is fed up to them by the common feeding apparatus. On the outside of these biting rollers are two combs, one to each roller, their teeth near and pointing to each other. As the cotton containing the seeds is presented by the apron to the bite of the small rollers it is drawn in, bringing the seeds up to the biting rollers. The combs before mentioned having a rapid vibrating motion, separates the seeds from the cotton, the fibre passing through the rollers into the receiving chamber. These processes constitute the ginning of long-staple or Sea Island cotton. To gin the short-staple cotton in this machine, a revolving brush is applied to clearing the staple of all remaining dust, and to blow it into the receiving chamber.

AN ENGINEER'S RESPONSIBILITY.—A railroad engineer keeps his eye fixed on the track with the steadiness of an eagle, every moment that the train is in motion, and if one will pause to think of it, when dashing along at the rate of five and twenty miles an hour, it is awful to remember that he is the only person who does look ahead. The fireman takes it easy, firing up when necessary, ringing the bell, applying the brake, etc., as he is directed, but he does not trouble himself to keep a steady look out. As to the conductor, brakemen, etc., they cannot look ahead, even if they wanted to, any more than the passengers can. It is curious to think, too, how slight a thing may hurl the train to destruction; the breaking of a flange, a rail, a nut, a screw; the sudden slipping of a valve—any of these, apparently unimportant things, will send the train whirling down a precipice or into a river.

MAMMOTH CASTING.—On Thursday evening in presence of Governor Downey and other gentlemen, the largest Kettle ever made in the United States, was cast at Donohoe's Foundry in this City. It weighs 9114 pounds and will contain 1316 gallons of liquid. It is to be used for boiling tallow after it is tried out in steam boilers—and was cast for Banning & Hinchman of San Pedro.

DEAD MEN'S THOUGHTS.—Some of the most eminent physiologists in Germany and France have argued the very curious question as to whether a man feels after his head is cut off. In support of this unpleasant theory facts are adduced, with grave vouchers for their authenticity. Among others, is the most unfortunate Mary, Queen of Scots, whose lips continued to move in prayer for at least a quarter of an hour, after the executioner had performed his duty. Windt states that after putting his mouth to the ear of a departed criminal's head, and calling him by name, the eyes turned to the side from whence the voice came; and this is attested by Fontenelle, Mogore, Gnilitine, Feuche, and Aldini. On the word "murder" being called in the ear of a man executed for that crime at Coblenz, the half closed eyes opened with an expression of reproach on those who stood around.

WHAT THE RECENT EARTHQUAKE DID!—We learn from our exchanges that the late Earthquake, which was felt at intervals during three days in Alameda county, actually made a fissure in the earth, which has been traced for eight miles in Murray township, and in some places is from three to four inches wide. Many springs were started in new places, and old ones replenished with a flow of good water. Adobe and brick buildings will henceforth be considered unsafe in Alameda county.

PHELAN'S BILLIARD SALOON.

THE ABOVE BILLIARD SALOON, WITH EIGHT FIRST CLASS PHELAN TABLES, is now open to the public. The Cushions on these tables are the latest patent, and are a great improvement on their predecessors. The ROOM is fitted up so as to combine ELEGANCE with COMFORT. The BAR will be kept constantly supplied with the very choicest brands of

WINES, LIQUORS AND SEGARS,

And the subscribers hope, by strict attention, to merit the patronage of all who admire and practice the GAME OF BILLIARDS. DAN LYNCH, 720 Montgomery st. op. Metropolitan Theatre. M. E. HUGHES.

The subscriber begs to inform the public that the above mentioned Billiard Saloon is also intended to serve as a show and salesroom for

Phelan's Patent Combination Cushions and Model Billiard Tables,

And Billiard Trimmings of every description. Parties desirous of purchasing Billiard Tables will thus have an opportunity of selecting from a varied assortment, both in style and finish, and can also test the superiority claimed for the Cushions and Tables. Mr. DAN LYNCH will always be on hand, and ready to give all required information with regard to the merits of these JUSTLY CELEBRATED BILLIARD TABLES. The subscriber cordially invites all interested parties to call and examine. M. E. HUGHES, Agent for Phelan's Patent Combination Cushions and Modern Billiard Tables

BERGER'S BIJOU BILLIARD TABLES,

With PHELAN'S PATENT COMBINATION CUSHIONS.

The subscriber desires to inform the public that he has now on exhibition at

Phelan's New Billiard Saloon,

Montgomery street, opposite the Metropolitan Theatre one of the above mentioned BILLIARD TABLES, and cordially invites the patrons of the noble game to call and examine. The Great Master, Mous. Berger, speaks of the Tables in the highest terms of commendation. To private families these Tables commend themselves, especially on account of their convenient size, and as an article of furniture for a private dwelling there is nothing more desirable; in short, no household or mansion with any pretensions to being well regulated, should be without one. Gentlemen about to build residences should by all means make provision for a BILLIARD ROOM, where their family can enjoy the noble, graceful, and health giving game of Billiards.

M. E. HUGHES, Billiard Table Manufacturer, and Agent for PHELAN'S PATENT COMBINATION CUSHIONS, etc., etc. Exhibition and Salesroom, No. 720 and 722 Montgomery street. 7313

OFFICE OF THE SAN FRANCISCO AND SAN JOSE RAILROAD COMPANY. San Francisco, July 10, 1861.—Notice is hereby given that a meeting of the Stockholders of said Company will be held at the office of said Company, in the city of San Francisco, on the SECOND MONDAY (the 12th) of August next, commencing at 10 o'clock A. M. and closing at 4 o'clock P. M. on said day, for the purpose of electing seven Directors of said Company, to serve for the ensuing year. By order of the Board of Directors of said Company. Jy20 T. DAME, Secretary.

* Bancroft's Hand-book of Mining for the Pacific States.

A Word to California Farmers.

Observe that the millers of California are bent upon making the farmers furnish them clean instead of dirty wheat. The millers of Yuba county, according to the *Appeal*, have declared that they will not encourage this nuisance any longer, and producers may be sure that wheat which was the result of their threshing ground and a heterogeneous admixture of unmerchantable rubbish in it, will find its proper place, and be classed with "rejected" or "inferior," when, with care, it might command the highest current rates. There is no excuse, with the present prices, for such a shiftless policy as has heretofore been pursued by our farmers, and it is to be hoped that this year's crop will be able to restore the reputation of California wheat in foreign ports.

The *Napa Reporter* says, in connexion with this subject: "We see by some of our late exchanges, that the large quantities of barley, oats, etc., present in the wheat shipped from California, has tended materially to depreciate its value; and our farmers, and all interested in the grain business, should pay particular attention to this fact if they want a market to ship their surplus grain to. Practical millers have always felt the want of complete and perfect machinery for cleaning grain, or rather separating not merely wheat from chaff and foul matter, but the wheat from the oats and other grain, which is often mixed in growing; and ingenious mechanics have experimented a great deal in trying to produce the machinery so much desired. Hitherto, but partial success has attended their efforts. It is with great pleasure, then, that we call the attention of our farmers, millers, and interior press, to the fact, that this want can now be supplied by the purchase of Turner's Improved Combined Smut and Grain Separator—the most perfect machine of the kind in the world. It has no equal in scouring, separating, and otherwise cleansing grain from smut, chaff, grown wheat and other impurities. As wheat always contains, when brought to market, more or less smut, dust, chaff, and other stuff, and in passing it through a smut mill, if the grain is the least damp, the smut, dust, etc., are liable to adhere, it is absolutely necessary that the smut balls should be taken unbroken, before the grain enters the smut, and the first pass out as soon as scoured from the berry, that the grain may not wallow in it.

In this machine, the smut is composed of from three to seven sets of horizontal scouring plates between which the grain passes. The lower plate or runner of each set is provided with beaters, which throw the grain against the upper plate, which is stutloary and also provided with beaters, thereby causing the grain to act against both plates with equal certainty and uniformity. A rough or sharp surface is not depended on for scouring, but it is claimed that what the machine will do the first month it will continue to do for years in the same manner.

The grain enters at the top, where it first falls upon a zinc sheet iron riddle, through which the grain passes, taking off sticks, stones, etc., over it. The grain then falls upon the first inclined plane, then into the first blast from the fan at the bottom of the machine, which takes out most or all of the smut balls, oats, chaff, and other light impurities, before the grain enters the smut. This all millers know to be of the greatest importance, particularly if the grain be damp. The grain then passes out of the blast of the Separator into the smut, the dust passing through the perforated case opposite each set of plates, and drawn up into the top fan and carried out of the Mill if desired—the grain passing through the smut, discharging the heavy screenings at the angle in the enlarged spout.

The Machine is well ventilated, by a blast from the lower fan into the center of the Machine, by which there is no possibility of its ever becoming filled up or clogged with dust.

This Machine makes five distinct separations: 1st. The heads, sticks, etc., over the Riddle. 2d. Screening from the first blast, (which are the lightest,) and before the grain enters the smut. 3d. The dust. 4th. Screenings from the second blast of the Separator, after the smut. These last are free from dust, and in good condition to grind for feed or otherwise. 5th. The clean grain, at the bottom of the Machine.

Only one driving belt is required, and but two in all—and can be as easily attached as any upright smut. Rolling screens may be dispensed with, except for cockle.

The step of the smut shaft is the only place from whence arises any danger from fire, by the friction of the smut Mills; hence the absolute necessity of having the step always in sight, and convenient to be oiled, with no liability to run dry, from its situation being unapproachable without taking the Machine to pieces. All Millers, and all vigilant and competent Insurance Agents, should thoroughly examine all smut Mills and report to their principals, whether the step of the Machine can be examined daily,—its facility for oiling,—its contiguity to wood,—the velocity of the Machine, and its liability to clog with dirt. As sad mistakes have been made in this important matter, all parties interested are particularly requested to examine this Machine. Aside from any danger from fire, the convenience of the miller should be consulted. He is desirous of knowing and should know to a certainty, that the step is oiled and in good order, and this he should be able to ascertain with as little trouble as possible, and as often as desired. In this machine the step is always in sight, and can at all times be examined and oiled as easily as any ordinary journal. It holds nearly half a pint of oil, and can at any time be drawn off and replenished. No

grit or dirt can remain in the step, but will be thrown off into a lower cavity. From these considerations the Machine is regarded fire-proof.

Millers and farmers desiring to obtain this valuable machine can do so by applying to J. SILVERSMITH, proprietor MINING AND SCIENTIFIC PRESS, No. 20 and 21 Government House, San Francisco—he being the sole agent for California. He would also be happy to confer with parties desirous of purchasing the right to sell the "Combined Smut and Grain Separator," in any county of the State.

TO INVENTORS AND DISCOVERERS, MECHANICS AND MACHINISTS:

The undersigned, having had great Experience and Facilities for completing and carrying out Inventions and Improvements upon all kinds of Machinery and Implements, also preparing the requisite Drawings, Models, Drafts and Specifications, and is otherwise conversant with all principles in Mechanics of modern practice, and could prove, therefore, of invaluable aid to Inventors and Discoverers. Those contemplating bringing their inventions in a proper shape before the U. S. Patent Commission are particularly requested to consult the subscriber.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved

AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz:

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.
2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.
3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.
The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,

THE GREAT WORK OF THE AGE.

Previous to the commencement of the civil war now raging in the Eastern States, the people of California had begun to look upon the building of a great trans-continental railroad as a delusive hope held out by politicians to the masses for political purposes. It has been the pet idea of California for the past ten years, but like the *ignis fatuus*, when they thought they almost clutched it, it was gone! At the last session of Congress that long nurtured hope seemed nearer of accomplishment than ever before. Advice came by Pony Express that it had passed one branch, and was certain to be approved in the other; but it was "killed" by amendments, as usual, and the next Pony brought us word of the death of the Pacific Railroad Bill.

Most people, on the breaking out of the war, were of the opinion that this national calamity would bury the great project, beyond hope of resurrection. They think so yet; but we differ with them. It is our firm conviction that it will rather hasten, than retard the consummation of this vast enterprise, and for the following reasons:

Heretofore the measure has been defeated through the instrumentality of Senators and Members of Congress who were actuated by sectional jealousies—those from the South desiring a Southern Railroad, those from the North desiring a Northern Railroad, and a third party anxious that it should take a Central route. It has often been defeated through the exertions of a Senator who long misrepresented California, and whose great influence upon these conflicting elements was so cunningly exerted, that whilst invariably appearing to favor the passage of such measures, he really did all in his power to prevent it. It was frequently argued too, that no necessity existed for the immediate construction of such a road—that the United States was a peaceful nation, and was so powerful that other nations would always strive to avert, rather than provoke war with her, and that consequently, although the States and Territories bordering on the Pacific Ocean were exposed to attack in such an event, yet there was no probability of such an attack being made. The vastness of the undertaking, too, staggered many, and the question of practicability of the various routes proposed, was a convenient safety valve. These objections have now all been removed. Nearly all of the most capacious opposers of the Central and Northern routes have voluntarily abdicated their seats in the Halls of Congress. The seat of the Senator from California who did so much to injure her, is now filled by one whose whole heart favors the immediate construction of a Pacific Railroad—and we have no doubt but that Senator Latham will co-operate heartily with Senator McDougall in this measure. Recent events have also shown that if even no danger need be apprehended from foreign attacks, an enemy may be nurtured at our very hearths—and but for the secrecy and forethought of the present administration, California, despite her large majority of Union-loving men, might at this moment have been one of the rebellious Confederate States; for it is a well known fact that a small minority if disciplined and well armed can always control the action of a large but unarmed majority. Rapid conveyance and communication between the Pacific and Atlantic sides of the continent, would render any attempts of Pacific States and Territories of the Union, to secede, utterly impracticable. Besides, powerful as our Government is, there is no guarantee that it may not at any moment be involved in war with one or more of the great European powers; in which contingency, these States and Territories might be invaded and conquered before aid could reach us from the seat of Government. Hundreds of heavy capitalists in Europe, as well as in America, would gladly embark largely in the enterprise, vast though it be. They foresee the immense profits that will accrue to them from such a work. The Central Route seems to be the favorite one, and in regard to its practicability there never has been

any question, excepting in that part of where the line of railroad must cross the Sierra Nevada. In reference to this matter we have just come across a paragraph in a Washoe paper that will settle the point. Our contemporary says:

Yesterday we had the pleasure of meeting Mr. T. D. Judah, Chief Engineer of the Central Pacific Railroad Company. The company are acting under a charter obtained from the State of California, and it is their intention to construct a railroad from Sacramento to the California State line, and possibly further. For the past six weeks Mr. Judah and assistants have been busy making a survey of the route. A preliminary survey was made last January from Sacramento to Dutch Flat. The party left the latter point June 4th, and commenced their work eastward. From Dutch Flat they went up Bear River Valley and the South Fork of the Yuba to the summit of the Sierras. Thence they continued by Donners (nearrely called Truckee) Lake down the Truckee river. The party have proceeded as far as Stone's Crossing on the Truckee, and intend to continue the survey to Fort Churchill. Mr. Judah reports that at no point on the route will the grade exceed 110 feet to the mile requiring no unusual engineering skill. The entire snow belt to be overcome on the route will not exceed thirty miles, and over a great portion of that distance the snow falls to but a moderate depth. The distance, by the measured survey from Sacramento to Stone's Crossing, on the Truckee in the Truckee Meadows, is but one hundred and fifty miles. The cost of the road and outfit from Sacramento to the State line (which is supposed to be near O'Neil's Crossing on the Truckee) is estimated at \$9,000,000. The work upon the road, with the exception of about fifteen miles, can be prosecuted during the entire year.

Mr. Judah will, when he finishes his present survey, proceed to Washington and report to Congress on the feasibility of the work. Doubtless, Congress, at its next regular session, will act finally and favorably upon the matter. We hope and firmly believe it will. But in any event, a Pacific Railroad will be built. If government will not aid the work, it will be done by private and independent enterprise.

HOW TO PURIFY THE BENSLEY WATER.—A writer in the *Evening Journal*, makes the following remarks concerning the Bensley water:—When the Bensley reservoir was completed, it was expected to be a great boon to San Francisco, in more than one point of view. It commanded a height that could force water with ease to almost any house in the city, and its capability, also, in point of size, could withstand any extra drafts, and last, though not least, it was considered that the water from a new, clean reservoir, through new channels, would be pure, at least purer than that which was then served to the public—but, alas, it is such beastly stuff that it is a common nuisance. Now, as far as the reservoir is concerned, it is a magnificent piece of work. To stand on the north-western corner, and see the beautiful liquid flowing in, it seems most astonishing how it gets so metamorphosed before it reaches its various destinations in the city. Now that the water flows into the reservoir pure as any other water on the Pacific coast, I have not the slightest question, and that the change takes place there I am also confident. After a few warm days, the water is sure to become bad; the hotter the weather, the worse the water. The cause is so plain that any one who devotes to it the slightest attention can see the chief reason. The sun having full power upon it, causes one of its most valuable properties to evaporate, at the same time, with the combined action of the air, generating rapidly both animal and vegetable matter. A great portion of the animalcules thus generated are destroyed in the channels and decompose; the vegetable matter increasing by adhering to the sides of the pipes in a kind of green slimy matter, which at intervals the action of the water breaks off in large pieces, and again working it up, gives that green cast we observe in the water when it is so bad. Now, the remedy for this is so simple that I cannot conceive how a company who have done so much do not attend to it. The reservoir, though large, is not of such immense magnitude but that it might be covered. I would recommend a roof just sufficient to keep out the sun, (not asphaltum,) and admit of ventilation; the sides, weather boards, with a space between each. This done, and the channels cleansed, for they have now become impure, I will engage to say no more complaints of the same description will be heard. Nearly my whole life has been spent in the manufacture of articles whose chief ingredient is water, and it being absolutely necessary to have the purest, I have seen many important plans worked out, and this is my excuse for troubling you.

N. B. It is supposed by some that artisan water is best exposed to the sun before using, but if the sun is excluded and air freely admitted, it would be found better.

EXTRAORDINARY CASE.—The last number of the *S. F. Med. Press* mentions a case in which the head of the thigh bone and a considerable amount of the hip bone were removed, and yet the patient was able to walk on the 16th day. This appears almost incredible, but it is true nevertheless. The operation, by Dr. Cooper, was performed in presence of several medical men of this city, and the patient, the daughter of Mr. James Travis, is now on the corner of Broadway and Kearney streets, constantly improving with every prospect of complete recovery. This case is the more worthy of record since hip joint disease is so rife on this coast, and it shows that relief may be obtained in the most hopeless cases.

BLIND CATTLE.—We learn, says the *Bee*, that W. C. Wright, of Knight's Landing, in Yolo county, has 50 head of stock out of a herd of 200 that have gone blind within the last six weeks. C. F. Gray, also of that place, has 70 gone blind out of 200; and Kirk and Phillips in that vicinity, have many that are going blind. And we learn that all the way from Fremont to Colusa, cattle are going blind.

EL DORADO AGRICULTURAL SOCIETY.—This society will hold its fair on the 10th, 11th, 12th and 13th of September. Wilson Flint, of Sacramento, will deliver the address.

Survey of the Upper Sacramento.

At present, as is well known, the Sacramento river is navigable only as far as Red Bluffs, Tehama county. The citizens of Shasta, however, have long desired to make the city the head of navigation, and being desirous of learning the character and extent of the obstructions in the river, they commissioned some gentlemen to make an exploring expedition to that end. It seems that they started on the 10th inst., from Waugh's Ferry, Shasta, down the stream. The following are the notes taken by the explorers during the trip:

For the first one and a half miles below Waugh's Ferry, strong current, bottom granite or slate ledge, a few obstructions in the channel, rocks projecting above water at ordinary stage, channel crooked, three feet of water at all points. Next three miles, river about 600 feet wide, and straight, no obstructions, six feet of water. This brings us to the upper end of Horse Head Bend, three miles around, channel narrow in places and very crooked, three feet of water at all points. Then very fair river, three feet water at all points to Ball's Ferry. Just below this point, island in the river; gravel bottom, shoal, two feet water in the deepest channel. Then very fair river, three feet water at all points to Charley Smith's rifle, half mile below the mouth of Clear Creek. This rifle presents the most serious obstacles that we found in the whole extent examined. From head to foot it is from 600 to 800 feet in length, and about 600 wide and very strong current, with very uniform depth over the entire rifle, not averaging over one foot, except in one channel which is nearly straight and about 70 feet wide; in this channel there is two feet water. The bottom on this rifle is of a kind of cement, by some called adoba; the water seems to have but little effect on it, but it can be easily removed with the pick. Below this point good river to Down's rifle, a gravelly bar, three feet water, and just below this bar, several tow-heads and adoba lumps in the river, but very simple and easy to remove; four feet water. From here to the mouth of Cow Creek, good river; at this point there is one lump of cement or adoba which should be removed, though there is over 4 feet of water in the channel. From this point to the head of what is known as the Iron Canon; there are no obstructions worth notice. The first obstruction here is the White Horse Rock, one isolate boulder about the middle of the channel, on a strong rifle river about two hundred feet wide, from five to eight feet deep. Next, about one-half mile below, is what is called the Black Horse Rock, in every way similar to the White Horse Rock, and in the same kind of river. This Canon so called, is about ten miles long, a very deep and straight channel and no obstructions, except those already described. One other fact, however, that is worth mentioning, as to the width of the river; at one point 125 feet long, the river is only 37 feet wide; this we measured; but an 80 foot line would not reach the bottom. Below this point there are no obstructions to Red Bluff, where a few of those adoba lumps are visible in the river, that would require to be removed. The Committee did not make any estimate of what the probable cost of removing these several obstructions would be if undertaken.

SAN FRANCISCO AND VALLEJO RAILROAD.—The stockholders of this road says a Marysville exchange, held their annual meeting in this city last Wednesday evening, and the following officers were chosen for the ensuing year; J. B. Frisbie of Vallejo, and D. W. C. Rice, C. B. Fowler, W. K. Hudson, J. E. Galloway, of Marysville, and W. G. Hunt, of Yolo Trustees; J. B. Frisbie, President; C. B. Fowler, Vice President; W. K. Hudson, Treasurer, and Theodore A. Coul Secretary. Frequent inquiry is made as to the progress of the road, and while we have no faith in the frequent and unauthorized stories which are circulated concerning the immediate completion of the road, it is but just to the Company to say that while the war has laid an embargo upon all foreign trade it cannot be reasonably expected that any foreign capital can be induced to seek investment in any of the United States.

FATAL ACCIDENT.—A letter from Murphy's, Calaveras county, gives the San Joaquin Republican the following details of a fatal occurrence, in which two men were killed, July 19th:—"A very melancholy occurrence took place this immediate vicinity on Friday last, by which two worth hard working and industrious young men lost their lives. It appears that the men were at work in a tunnel somewhere in the neighborhood of seventy feet under ground, and near the shaft, at the commencement of the tunnel, a large quantity of water escaped from a neighboring shaft, deluging the tunnel with water, rocks, timber, etc., and of course carrying and mutilating in its course the unfortunate men. Their bodies were recovered some 400 or 500 feet from the place where the accident happened. I have been unable to learn the names of both, but one of them is named Richard Teddy."

FECUNDITY.—The San Jose *Mercury* says that on Thursday July 18th, a cow belonging to Dr. George McCrackin, Pike Canon, in that county, gave birth to five mail calves.

SUMMARY OF MINING NEWS.

CALIFORNIA.

People in San Francisco are still wondering whether the famous "Riley lead" is, or is not, a humbug. Our readers will remember that certain parties recently came here professing to have discovered an unexpectedly rich vein of antimonial silver ore, situated about 160 miles from Los Angeles. They brought hither and exhibited some splendid specimens, and various parties in this city were induced to purchase shares—the total amount paid in being in the neighborhood of \$25,000. Mr. Bailey and his partner, Dewey, contracted for machinery, mules, etc., but when they, with the joint stock company, were about to start for Los Angeles on the steamer, those two gentlemen could not be found. Their friends, however, say, that Messrs. Bailey & Dewey did not care to be followed by adventurers who had paid nothing, and accordingly dodged them, going down by the Overland Stage, and that the purchasers of stock will have no reason to complain. This is borne out by a report in a city paper, this week, to the following effect: A gentleman informs us that on Friday week last, two men stopped the San Jose stage near San Bruno, and requested to be taken in as passengers. The driver informed the parties that the vehicle was already full, and they could not be accommodated, whereupon there was a consultation, a diving into pockets, and finally a compromise. The men were allowed to take places on top. One of them had a carpet bag, very heavy, and the other had the pockets of his coat, pants and vest filled with something very heavy, like coal. At San Jose a team was waiting for the parties, and they mounted and disappeared. It is supposed that these men were Messrs. Bailey and Dewey—but whether they are playing true or false remains to be seen. . . . Several mining companies have within the week, filed their certificates of incorporation in this city, viz: The Scoria Mining Company, capital stock, \$50,000, divided into 500 shares of \$100 each, and its purpose, to mine in Tuolumne county. The Trustees for the first three months are W. J. Sayward, A. W. Brooks, Isaac Rowell, John Gordon and J. T. Dean. Union Gold and Silver Mining Company, capital stock \$1,620,000 in 16,200 shares of \$100 each. The company will mine gold, silver and other minerals in Ross Mining District, Tuolumne county. The Trustees for the first year are: Samuel G. George, Edward S. Howell, Samuel E. Holcombe, Wm. T. Henderson, John J. Kelly, Charles T. Powell, Jeremiah Saries, George Wheeler and John Wilson—and the Prieta Mining Company. Capital stock \$100,000 in 1,000 shares of \$100 each. This company will work gold and silver mines in the State of Sonora, Mexico. The Trustees are: C. T. Fox, Peter Thompson, J. S. Paxton, B. H. Hill and C. W. Boynton. . . . The mines throughout this State appear to be active, and the gold, silver, copper and coal mines are yielding well. In the northern portion of California, a number of miners, excited by the reports from the Nez Perces mines, are going thither. We trust they will not come back "sadder but wiser men." Washoe is active, but the tide of emigration from California thitherward has evidently turned.

Sierra County.—From the Mountain Messenger, we condense the following interesting item:—At Minner, in the Keystone tunnel, commenced in 1853, 17 men are at work. Gravel was reached in '50, since which time the Keystone has paid \$50 to the share, weekly. This tunnel connects with the Mammoth from Chis's Flat. The Blue tunnel, commenced in 1852, paid well, but was abandoned in '57; it is now being worked a second time, and the bed rock is found to pay very well. The Cedar tunnel, through which the Pennsylvania Co., of Centerville, runs gravel, pays \$7 per day to the hand. Mt. Tunnel is working a hydraulic claim, which is not very promising. Minnesota is supplied with water by the Truckee Lake Co. Quartz excitement is running high among the Minnesota boys. A ledge, known as the Plumbago, has been discovered; specimens, a number of which we inspected, are remarkably rich. About ten tons of the ore, the least auriferous to be found, has been crushed at the German Bar Mill, paying \$45 to the ton. The quartz, it is generally believed, will average \$150 to the ton, ground is staked off for several hundred yards along the ridge, and Minnesota are of the opinion that they have secured the Grass Valley belt. The ledge, struck this spring, appears to be of the pocket or spotted character, but is evidently rich, and will doubtless prove highly profitable to most of those engaged in this branch of mining. . . . The diggings of Alleghany, although pretty well worked out, are paying tolerably well. The owners of the Pacific and Alleghany tunnels have been successful this spring and summer; their claims at the present time are moderately remunerative. . . . Chamberlain, a hard worker of a miner, Alleghany, in the same lead, is a new town and is expected. The Red Fox, Eureka, Fox, Eskador and Union tunnels, large enterprises, are paying. The Northwestern and Chamberlain tunnels are worked out. The Nebraska and Typhoon, commenced May 24th, 1854, are in 2,875 feet, having about 200 feet to run before reaching the main deposit. These companies are running a main tunnel together, intending to branch off in their respective tunnels when gravel is reached. These companies, we are informed by John Bogal, a member of the Nebraska, expect to strike through water this fall. They say they have a good thing when the blue lead is reached. . . . At Smith's Flat, a short distance below Alleghany town, several hydraulic claims have paid well this year; and the Blue and Hook & Bull tunnels are at present turning out gold. . . . At Chis's Flat, the Mammoth and Conway tunnels are paying wages. The Americana Quartz Mill, considered a good property, is idle at present, being in litigation. . . . Pat Hayes, a miner from Smith's Flat, has purchased a large tract of land for mining purposes. The purpose of staking the land is expected. . . . N. Smith, of Gibsonville, sold a one-fourth interest in the Levi Hill claims, at Mount Pleasant, during last week, for \$7,000. . . . Forest City is lively. The tunnels about town have paid pretty well this season, and are now compensating those at work in them. Among the rich claims of Forest City are the following: Live Yaukey, working forty men; Oregon, thirty hands; and the Grey Eagle, formerly Uncle Sam, in which thirty-five miners are employed. The Golden Gate is working fifteen hands—paying wages. The Gold tunnel, which has been running about five years, recently cut into rich gravel. The Dutch Company, one of the oldest mining companies at Forest City, has reached a back channel; the claims will soon be ready to breast and will be found rich. The Little Rock Co., hydraulic, is carrying on mining extensively; and the diggings are reported rich. There are several small companies at work, most of which are paying pretty well. . . . The Democrat says operations are commencing with a view to gold and silver, and putting in their dunes, and in a few weeks miles of the Yuba will be lifted from its gravel bed and carried off through dunes set for it by the industrious miners. . . . A piece of gold, weighing 19 ounces, and worth \$350, was found recently in a ravine, two miles above Downieville.

Placer County.—The Courier informs us that on the Middle Fork of the American River, things look lively. The mining operations now going on, on the river bars, with the huge derricks heaving away stones, rocks, boulders, and sand, with ceaseless strength, to the great shock and wonder of the whizzing little pump-shafts, that raise the water from the bed rock, tend to give the neighborhood a very business-like appearance. Story Bar, about a mile above American, on the north fork of the Middle Fork, is principally owned by one company, of which Messrs. Hassett and Frisbie are the principal owners; and is yielding high wages—not less than half an ounce per day to the share. . . . Junction Bar shows mining activity. . . . Willow Bar is a continuation of Junction Bar, and is all taken up by five companies—the Junction Bar claims, McChesick & Co., the Dumbey claims, Willow Bar claims, and Chinese claims—all being now actively engaged in preparing their ground for an active summer's mining campaign. Several large dikes cross the river in this neighborhood, to supply water on bars below. A wire-suspension foot-bridge across the river is also quite a feature. . . . American Bar is nearly all occupied by four different mining companies, one of which is a Chinese and another an Italian company. The claim on the site of Brooks' old quartz mill is being worked, and is said to be good and rich. . . . Pleasant Bar is located a short distance below, and seems to be an active and pleasant little mining camp. . . . Boston Bar is located on the opposite side of the river. This is the Bar for which, we

understood last spring, \$50,000 was offered by a Chinese company—one-half cash and the balance in six months—but the trade was not effected. The company are now busy stripping their claims with several derricks and large water-wheels. When they get "down" they seem confident of "striking it rich." The Bar is very extensive, and there are many years' operations upon it before it can possibly be worked out. . . . Horse Shoe Bar is next below, on the Placer side. Here there are many mounds and booms, and tremendous big water wheels, which makes the place look somewhat like a sea-town at a distance. The principal mining companies are the "Pioneer," the "Citizen" and the "Lad." The latter, with almost any number of Chinese, all of them are out stripping their claims, and the water is yet very high—in fact, higher than it has been for a number of years at this season of the year. . . . Eureka Bar is on the El Dorado side, below Horse Shoe. A rari, dune, wheel, etc., indicate that active operations are intended to be carried on here this season. . . . Gray Eagle Bar, on the same side below, is a very pretty mining camp, and a number of miners' cottages, gardens, etc., show that it is a desirable and pleasant place to live at. . . . There a number of good claims at Mad Cane Bar.

San Bernardino County.—Recent correspondence in the Mirror, from Patocoma District, gives us the following information: The laststone that will draw hither commerce and population now lies embedded in the San Bernardino range of mountains in the shape of vast silver, copper and tin leads. This district is located on the left side of the San Gabriel river, and facing a desert from 15 to 20 miles in width, and which commences at Tejon Pass and extends to San Diego and the Colorado river. This district commences two miles west of Cosenbury City, and, running eastward, embraces an area of ten miles square; on the south side the divide of the mountains is the line, while the desert space on the north defines its boundaries. Scattered in California, in so small a space, are crowded such hoards of wealth. The larder has upon its shelves thirty-five leads, besides thousands of original discoveries to any number. Of the thirty-five claims recorded, twenty will prove as valuable as those of Washoe. Among that number is the Patocoma, Rothschilds, Gray Eagle, Esperanza, Cook, and the Frenchman's, all silver leads. In copper and silver, the North Star, Franklin, and Alta leads, and in tin, the Homesun. The hills have a gentle rise from the desert for about three miles; then the mountains rise in a bold, serrated line to the east and west, as far as the vision can extend, while on the north, across the black hills, the San Gabriel, the San Luis, Indian, and Fort Mohave range, binds the horizon. In this district there are about two hundred and fifty persons, with daily accessions to that number from Los Angeles, San Bernardino, Holcomb and Bear Valleys, is one hundred miles via Tejon Pass, and by the new toll-gate road, one hundred and twenty-five miles. The location called Cosenbury City is the only green spot of ten miles, and is the only place where the Indians, the Shays, Indians, and have and Colorado rivers. The Indians that range through here are the Cohoshes. Their village is distant about 20 miles, and they have visited every camp within their district—chiefs, warriors, squaws and papposes—to assure the white man that they are friendly.

Tulare County.—The Visalia Delta of the 18th inst., says:—A. H. Clark, John Stearns, Samuel Klinger and Joseph Smith, arrived from Co. on the 12th inst. They crossed the summit of the Sierra Nevada near the source of the south fork of Kern river, and were near two weeks on the road in consequence of having lost the trail. Jacob Nash, Stephen Kidd and John Clark also arrived on the evening of the 12th. They came direct across the Sierra Nevada via Monteito Valley, near the source of the South Kern 20 miles distant from Silver Mountain; thence to the north fork of the Kern river, 25 miles; thence to the south fork of Tulare river, 30 miles; thence to Ukale Valley, north fork of Tulare river, 18 miles; thence across the foot hills to Visalia, 30 miles, making the total distance of 133 miles in five days, besides spending considerable time in looking for the trail, and in fishing and hunting. They believe the distance covered, in the event of a gold and coal strike, would be worth the expense of \$1500 or \$2,000 upon it. Prospects that Co. and adjoining districts will soon be a large producer in both gold and silver, are promising. A number of quartz ledges are being worked for gold, as yet only with the arrastra. The quartz of Sumner & Co. is paying \$100 per ton, in gold; the silver, which is the predominant metal, is lost, and besides, as is estimated, two-thirds of the gold. The Co. Company are running two tunnels, one of which is intended to strike the Pioneer lead 300 feet below the creek track, by the old tunnel, and into what is known as the Copper Point lead, and will strike the ledge 100 feet deep. Mills and machinery for the reduction of ores, are expected to be in operation in a few months.

Calaveras County.—The Calaveras Chronicle says:—No mining camp has grown more rapidly than the one which has sprung up in the neighborhood of the Junction Store. Several large buildings have been erected there during the past few weeks. The claims in Chile Gulch will last for years, and so long as the miners make good wages the camp will prosper. The most careful observer has not seen that Mohave Hill already feels the benefits resulting from the discovery of the deep diggings down the gulch. Our streets on Saturday nights and Sundays, have the appearance they presented in the palmy days of '54. . . . Great excitement exists over the river, in Calaveras, says the Columbia Courier, in consequence of the discovery of a rich gold and silver vein in the mountains, about 45 miles above the Big Tree Grove. It appears that a Mr. Martin was herding stock in the vicinity, when he came upon the party at work. He reports the miles to be rich in gold and silver, and has been heretofore discovered by the State. On the news reaching Murphy's and vicinity, the excitement became intense, and when our informant left there for Columbia, on Thursday last, the roads were filled with people in luggies, wagons, on horses, mules, jacks, and on foot, all making good time for "the promised land."

Nevada County.—The La Porte Messenger says:—From Minnesota one has a magnificent view of prominent points in Nevada county; Snow Point, even though looking under a July sun, presents its bed-rocked side of yellow; below Snow Point is Delores Flat, once a flourishing place, but now a prey to "sports"—a little farther up the river is the old mine, but continuing to yield gold pretty copiously; still farther south is Woodley's Flat, more prosperous than its neighbors; about six miles from Minnesota, toward the summit, is Kureka south, celebrated for its extensive quartz mines.

Amador County.—A valuable marble quarry has been discovered near Brytown. It offers a fruitful field to industry. . . . Not much has been said about the silver discoveries on Satter, Amador and Dry creeks, in Amador county, but from a private source, the Polson Telegraph learns that there is no doubt of the existence of veins of greater or less extent and richness. The Ledger learns that the miners working in the South Branch of Sutter Creek, and on Mohala Flat, near Volcano, are making remarkably good wages. The precious metal in that vicinity seems to be inexhaustible.

Plumas County.—A Washoe paper tells us that a party of prospectors from Virginia City have discovered a magnificent lead of copper ore, about 36 feet in width, in the neighborhood of Junction City, Plumas county. Some of the ore has been assayed by Ralling & Co., of Virginia city, and is found to contain some 68 per cent of copper. The lucky discoverers intend making arrangements for working it immediately.

Sacramento County.—Reports from the mining regions, which surround Folsom on every side, says the Telegraph, are very favorable in indicating an increase in the value of the deposits of mining operations. The miners are cheered by remunerative and adequate rewards for the deprivation of the many comforts and pleasures of life.

Siskiyou County.—We are authorized to state, says the Yreka Union, that a public meeting will be held in the Court House, in this city, on Tuesday evening, July 25th, at 8 o'clock, for the purpose of organizing a mining company, the object of which will be the opening of the extensive flat below and above the mouth of Greenhorn Creek.

Shasta County.—The Shasta Herald says: Buckeye and Churntown, two villages situated in the central portion of some of the richest mines in our country are almost depopulated. Water is so scarce that the miners during the summer are to negotiate the expenditure of mining operations. In consequence, however, of the return to them, and while the rats last rapidly replenish their purses with the precious metal.

Contra Costa County.—A correspondent writes from San Leandro on the 25th, to the Alta, Jack O'Brien took from the mines of the Pacific Coal Company, a few days since, a solid lump of coal weighing 900 pounds. It is now on exhibition at their office in this city.

Mariposa County.—The Mariposa Gazette states that the yield of gold from Fremont's mills for the week ending on Sunday of last week, amounted to \$70,000.

Klamath County.—The Humboldt Times says companies are organizing for the purpose of working the petroleum, or rock-oil springs in the southern part of Klamath county.

Los Angeles.—The News learns from Judge Hyies, who had just returned from Holcomb Valley, that all was quiet and all propitious there among the miners.

Tuolumne County.—The Courier says: The mining interest in this section of the country is doing very well and water is abundant.

NEVADA TERRITORY.

Alman B. Paul writes to the Bulletin, from Washoe, on the 21st inst., that:—We are off here in rather a subdued mood of Uncle Sam's domains, but the activity everywhere to be seen in fully mining, claims, and in the good old times of '49 and '50, was only its equal. I can hardly believe my own senses, when I look around me at the improvements, and know the fact that twelve months ago there was not a mill at work in Washoe; while at the present time some 30 old mills are in full blast, and some 14 more in progress of erection. Even to support this number of mills—they are within the range of five miles around Silver City—speaks well for the solidity of our country. To judge from the number of San Franciscans who are dropping over this way, I would consider some real interest was being manifested. Were I not one of the interested, I would like to give you California quartz readers some items about mills, machinery, etc., but to do justice to myself and them, I might have to cut and slash a little, and, under existing circumstances, perhaps might not be considered fair; and as they are all a pretty good set of folks, I will only say to California miners that we have everything here that there is no mill in the country of any character at all that is not working in a manner as good as California, and that none could pay this country a visit without having got some items on mining of benefit to him.

From the Enterprise, we learn the following news: The Zouave Company, Ellsworth ledge, some two weeks since struck a ledge 13 feet in width, which assays very rich. The company have run their tunnel 900 feet. . . . In the Silver Mountain District, which is situated on the head of the east fork of Carson river, and but lately discovered, some 5 or 6 tunnels have been commenced, and the section is right and good. The miners there, in the richness of their district. . . . The LaPorte Company now have their tunnel at about 1,200 feet, and are getting along well with their work. They are passing through a formation of trap rock, which requires some blasting. There are about fifteen inches of water now running from the tunnel. . . . The Mary Ann Company, at Gold Hill, have their tunnel in some 700 feet, passing through one ledge about 30 feet wide in their course. They will have to run 600 feet further before they strike their back ledge, which is known to be rich. Quite a stream of water is coming back from the tunnel. . . . Messrs. Clark & Derrick are moving the quartz mill, which used to be known as the White & Nutter mill, at the head of Oregon Gulch, in Balte county, California, to Gold Hill. They expect to use their mill for custom work.

Messrs. Ford & Co. are putting up a quartz mill on Carson river, about 400 yards above the mill of Logan & Robinson. The river is becoming dotted with mills. . . . Messrs. Dorst and his partners have sold a large tract of land, some 100 acres, for \$100,000. Subground for \$32,000, or \$300 per foot. The ground was purchased from Mr. Sabine a few months since, for \$100 per foot—quite a good interest on the money invested. . . . A correspondent writes us from the Humboldt that about 20 tons of quartz, from as many different leads, are being sent by ox teams to Red Bluff for the purpose of having it tested. Quite a number of capitalists from that place have interested themselves in the Humboldt mines. From Red Bluff to the mouth of the river, the section is right and good. Our correspondent thinks that the people of Virginia and Carson should give more attention to these mines, as they are rapidly increasing in importance, and a profitable trade might be carried on with that section.

Our citizens (in Virginia City) will recollect that some months since the transients Company, in sinking a shaft, struck a heavy stream of water, which prevented their sinking further. Since that time they have been running a tunnel for their claim, and have struck the ledge 550 feet from the mouth of the tunnel. They have found gold, and a splendid stream of excellent water is now running from the tunnel. . . . The citizens of Gold Hill now have a prospect for an abundant supply of water. The water which is being taken from the Bradbury tunnel, has been carried over the divide to Gold Hill, and now runs down the main street of town. There is sufficient fall for the water to warrant the construction of water works, and the introduction of the article into every house in town.

OREGON AND WASHINGTON.

Portland papers of the 16th, say: The steamer Julia arrived last evening, bringing about \$10,000 in gold dust from the Nez Perces mines. A letter from Oro Fino to a merchant in this city, dated the 8th of July, says: "Send us some coin to buy dust; we need it badly, at some price or other. Plenty of dust in the country, and nobody to buy it—no silver here. If you send me a package of silver, I will try to invest it for you in dust at your price, but we need several thousand dollars or more, in coin, to buy up the dust. The miners are able to hold it, and will not sell it unless they are enlisted by some one getting about what it is worth." There will probably be nearly 5,000 persons at the mines by October. We have letters to July 7. They represent prospects as continuing good. Miners at work are generally doing well. New discoveries are causing great excitement. . . . L. N. Wakefield writes to the Dalles Mountaineer from Oro Fino, Nez Perces mines, on the 10th inst., as follows: I got up here last night. Town lots and buildings are going up in price at awful strides—they ask for lots from \$100 to \$200, and with a lot about \$500 to \$1,000. It costs high to build; hauling logs, 75 cents per yard; carpenter's wages \$9 and \$10 per day; common hauls \$3 to \$5 and \$6. Ox teams can come from Lewiston, 40 to 45 miles, better than on the other side; but there will be no such thing as getting wagons here until loads are built. They ask 8 cents for packing from Lewiston, and 16 cents from the Dalles. As to gold, they have it up and down Oro Fino 20 miles or so, and up Rhinades Creek, say 10 to 22 miles, and they probably will average from \$5 to \$10 to \$20, and one or two claims from \$50 to \$100 per day to 75 cents. As to prospects, they are hurrying men up, and there will be a plenty, but prices are high. . . . Extensive gold diggings have been discovered on Barut River, Oregon, which prospect from 20 to 50 cents to the pan.

BRITISH COLUMBIA.

From our latest exchanges we learn that there is nothing of importance from the Cariboo or Antler Creek. Packers are busy, and pack animals are still in demand. Packing is 33 cents per pound from Yale to the Forks of the Quesselle—something more than formerly. A great number of miners are remaining in the Forks, anxiously waiting for the water to get sufficiently low to commence work. Their anticipations of a good summer's mining prevent them from returning, notwithstanding their slender means. . . . Several letters have been received from above, the tenor of which corroborates previous accounts; but the water is so high, that miners are unable to work in the beds of Antler, Harvey and Keithley's Creeks. Those that are at work on the benches above high water-mark, where diggings are found in abundance, paying from \$8 to \$25 per day. No gold of any consequence has been reported from the Cariboo or Antler Creek lately. . . . Ballou's Express brought down between \$10,000 and \$15,000, and left at New Westminster \$7,000 for assay, which we suppose will be down next trip. About \$10,000 came down in private hands. . . . A letter from the Cariboo to a party in this city, states that the mines are paying well. According to a gentleman whose veracity is vouched for, Harvey's Creek is paying those who are working there from \$25 to \$30 per day to the hand.

NEW MEXICO.

A Marysville paper says: Several gentlemen from Nevada county are in town on their way back to the newly discovered silver and gold mines of Potosi and the Colorado in New Mexico. Assays from there are remarkably good, and our Nevada friends intend to test some of the ledges thoroughly by means of arrastras. They will be provided with supplies, so as to remain through the winter. One of the party informs us that he has obtained good gold prospects from gravel deposits, at the head waters of the Gila, in which region he thinks there are valuable surface diggings, while the country being well wooded, watered, and supplied with grassy bottoms and arable soil, is adapted for settlement.

AUSTRALIA.

The amount of gold coin issued by the Sydney Branch of the Royal Mint, for the week ending on April 26th, was 30,000 sovereigns. The quantity of gold dust received at the same establishment during the same period, for the purpose of coinage was 11,840 ounces. . . . A gold nugget, weighing 132 ounces, was found at Ballarat on the 17th of April.

Drummond Light.

The Drummond Light is thus described by Mr. Baxter, in a recent number of *Recreative Science*. It is often called the Lime Light:—This brilliant light was the invention of Lient. Drummond, and was applied by him in conducting the Ordnance Survey in Ireland and Scotland in 1826. Its intensity was such that it was proved by him to be distinctly visible at a distance of ninety-five miles. It is so purely white that the most delicate shades of color may be distinguished by it as correctly as by daylight; whilst for photographic purposes it is invaluable, as it enables the photographer to work by night as easily as by day. To what extent this light is possessed of actinic properties, or whether this apparent power is due to the total absence of color in its composition, I will leave others to decide. I shall here only attempt to describe the best form of lime light apparatus which is yet known to the scientific world. The lime light gives out but little heat, and does not in any manner vitiate or consume the oxygen of the surrounding atmosphere; hence it is just the kind of light required for crowded rooms, factories, mines, tunnels; in short, wherever it is an object to limit the natural consumption of oxygen. As a proof of this, I may state that a five-jet lamp, belonging to the Universal Lime Light Company, which was exhibited in the Society of Arts Lecture Room, consumed thirty-six cubic feet of the combined gases in an hour, and did not increase the temperature of the room during that length of time. It gave a more pure and powerful light than their large chandelier, which was subsequently lighted, and which consumed five thousand cubic feet in the hour; the temperature of the room kept increasing, and the atmosphere was vitiated to an unbearable degree at the end of that period. It is hardly necessary to observe that, in common with all other lights of great intensity, it may be used for signal lights, its peculiar steadiness and continuity giving it the advantage over its rival, the electric light. For use at sea, or by the coast guard in case of wreck, and in cases where life and property are at stake, cheapness is a matter of no consideration for a light of this nature; still, where cheapness is combined with utility, the lime light has precedence over all lights, its cost being in pence where others cost pounds. Owing to the total absence of color, it is not only applicable to photographic purposes, but also for picture galleries, shops, etc. It is found to separate the most delicate shades of color, and, what is of more importance, it does not in the slightest degree injure the most delicate fabrics.

A single jet of the medium size is equivalent to forty argand, or eighty fish-tail gas lights, or four hundred wax candles; while its cost is from half-penny to five pence an hour, according to the quantity of combined gases consumed, the augmentation of which increases the power of light. For instance, twice the quantity of gas consumed per hour will give, not twice, but four times the amount of light. Comparing it with the illuminating power of common gas, a single jet, consuming four cubic feet of the combined gases per hour, equals that obtained from four hundred feet of coal gas.

ARTISANS WANTED IN GUATEMALA.—We are authoritatively informed, says the *Mirror*, that the Government of Guatemala is desirous of receiving from California, or the Eastern States, for permanent settlement in that Republic, a limited number of practical farmers, brick-masons, carpenters, smiths, and, in fact, industrious artisans of all kinds who would be willing to keep aloof from the politics of the country and rest content with profitable employment. The Cochineal crop—one of the staples of the country—having proven almost a failure of late, people are beginning to turn their attention to a greater extent than ever to the growing of cotton, coffee and sugar.

A GOOD FIELD OF WHEAT IN THE FOOTHILLS.—Thos. Dold, Esq., whose farm is situated on Auburn ravine, has the finest 80 acres field of wheat we have seen in the country this season. The heads are full and the grain nice and plump. The field has been nicely harvested, and the shocks stand in the field, just as if they had been gathered by an old farmer at home "in the States." This same field has produced excellent wheat for several years past.—*Placer Herald*.

A RECONNOITERING BALLOON.—Prof. ALLEN, of Rhode Island, this afternoon brought into the city a large balloon, which he inflated from the street gas-pipe at the corner of Massachusetts avenue and Fourth street, and afterwards loaded it down with sand bags for more convenient transportation to the Rhode Island camp, on Caton's Farm, at which place a cord 5,000 feet long was attached to the basket, and an ascension made to that height. The balloon is for immediate reconnoitering purposes, and it is said that he will start on his aerial voyage early to-morrow morning.—*Washington Cor. Tribune 11th*.

COTTON GROWING IN NICARAGUA.—We learn from Nicaragua that the subject of growing cotton in that State, is creating much excitement there, that a large quantity will be planted this year, and that one steam cotton gin is already at work.

GUIDE BOARDS.—The Board of Supervisors have caused to be erected, at an expense of about \$1,500 to Amador, guide boards at all of the cross roads leading through the county. This will be a great public convenience.

PRINTING OFFICE REMOVAL.**THE COMMERCIAL BOOK AND JOB STEAM PRINTING ESTABLISHMENT**

Has been removed to the New Office,
No. 517 Clay and 514 Commercial Streets.

Book Printing, Law Briefs, Catalogues, Business Cards, Hand-Bills, Circulars, Theatre Work, American Flags, Envelopes, Badges, Bills of Fare, Programmes, Posters, Legal Blanks.

We keep constantly on hand and for sale, an assortment of

NATIONAL FLAGS AND BADGES,

In beautiful and extensive variety. Sole manufacturer of the

NEW UNION ENVELOPE,

With original and Patriotic verses. Everybody should use it.

Our Office is complete and perfect in every respect,

And we shall endeavor, in the future, to merit a continuation of that patronage which we have heretofore so generously received.

VALENTINE & CO., PROPRIETORS.

Please call and give us a trial.

A. KOHLER,

NO. 178 WASHINGTON STREET, SAN FRANCISCO.

Forty Cases of Musical Instruments Just Received,

Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS.

Also, TAMBOURINES, BANJOS, FIFES, FLUTES, CLARION PICALOES, VIOLIN BOWS, BOW-HAIR, ROSIN BRIDGES, PEGS, TAIL PIECES, FINGER BOARDS, TUNING FORKS, SSS ROMAN STRINGS (four lengths and four thread), and

ALL KINDS OF MUSICAL INSTRUMENTS,

Fresh every two months from Italy.

All of these goods will be sold to the trade, as they are direct importations from the manufacturers of Europe, and imported in large quantities by A. Kohler. He will sell them thirty per cent. cheaper than any other house in California; therefore it would be the interest of all to call and examine before purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by the case.

The wholesale department of this House is on Sansome street, occupying the whole block from Clay to Commercial street. mh5

ST. GEORGE HOTEL,

Corner Fourth and J streets,

SACRAMENTO.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Potosi, \$175 per share.
Central, \$625 per share.
Ophir, \$1000 per share.
Gould & Curry, \$225 per share.
Chollar, \$15 per share.
Lucerne, \$20 per foot.
St. Louis, \$4 per foot.
Mount Davidson, \$60 per share.
Mark Anthony, \$8 per foot.
Louise, \$18 per share.
Bradley, \$5 per foot.
Sacramento, \$10.
Shelton Co., \$3 per foot.
Josephine, Flowery, \$10.
West Branch, Flowery, \$7.
Harrison, Flowery, \$12.
Yellow Jacket, \$25.
Exchange, East Comstock, \$40.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$16.
Ohio and Buckeye Co. Argentine, \$12.
Chimney rock, \$15.
Dugan, \$10.
Rich Co., \$3.
Miller, \$12.
Augusta, \$6.
Spanish Co. Plymouth Ledge, \$6.
Chelsea, \$8.
Caney Ledge, \$25.
King Charles, at Flowry, \$6.
Edgar Co., Great Western Ledge, Gelela, \$20.

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.
[Having completed all the requisite arrangements, we lay before our readers a reliable list of prices of mining stocks of Utah.]

NOTICE.—THE GENTLEMEN OF SAN FRANCISCO ARE RESPECTFULLY informed that their NEW BILLIARD SALOON, with EIGHT FIRST-CLASS PHELAN'S TABLES, will be opened for business on SATURDAY, June 29th, 1861. The undersigned respectfully solicits the patronage of all Gentlemen Billiard Players, and hope by conducting their Saloon in an unexceptional manner, to merit their continuance and support.

D. L. LYNCH.

WHEELER & WILSON'S

FAMILY SEWING MACHINES:

NOT ONLY

THE BEST FOR FINE SEWING,

BUT THE BEST FOR...

MANUFACTURING CLOTHING

AND...

OTHER HEAVY WORK.

SAN FRANCISCO, June 6, 1861.

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, Cassimere and Tweed Suits, etc., from materials made at the Mission Woolen Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them cannot be surpassed.

Various styles of Machines have been employed on the above materials, but the Wheeler & Wilson is preferred.

DONALD McLENNAN,
Proprietor of the Mission Woolen Mills.

jly 8

THE GRANDEUR OF CALIFORNIA FORESTS.—The editor of the Mendocino Herald has recently taken a trip to Big River; on the road from Ukiah Valley he passed through dense forests of Redwood, Fir and Chestnut so closely knitted together, that, he says, even the rays of a bright sunshine, if not entirely obscured are materially obstructed by the density of the woods. In fact, for miles we may pass at mid-day, as effectually sheltered from the rays of the sun, as though reposing in a dungeon. A sense of loneliness and dreary gloom surrounds the traveler. Scarcely a bird, or any living thing interrupts the silent monotony of the scene.

The amount of timber growing on this land is immense, and we might almost say immeasurable. Though the Redwood is at present the most valuable portion of the timber, from the ease with which it can be manufactured into lumber, and from lumber into the useful arts, it is by no means the only timber that grows here. When we stand on an eminence overlooking the forest we receive the impression that nothing but redwood grows there. It is the main growth—much taller and larger than any other forest trees—rising on an average, to the immense height of three hundred feet—and in extreme cases four hundred. The full-grown redwood tree appears to be about 7 to 9 feet in diameter, though we not unfrequently meet cases reaching to 10 feet, and sometimes even 12 feet.

Beneath this growth of forest giants the earth is studded with another equally dense growth, more numerous, though not of such huge proportions, of Fir. There are two or three varieties of the Fir, and one of them, is said to be even more valuable for lumber than the redwood; and all of them are beautiful to look at, as they rise to the height of 250 feet or upwards, while the diameter of their trunk may not exceed 12 to 15 inches. Their extreme diameter will reach, perhaps, four feet. Many of these rise to the height of near 200 feet without the appearance of a knot or a curve to mar the beauty and symmetry of their form.

But this is not all. Still another forest occupies the same space, though a little lower than the Fir. It consists mainly of the California Chestnut, Madrona and Oak. These do not present the stunted appearance they assume in the more open country, with crooked knotty trunks and bushy tops—but run up like reeds, apparently making strong efforts to enjoy the light of the sun's rays, by rivaling the Redwood and Fir in altitude. In this however, they fail, seeming to become exhausted at the height of about 100 feet. The average dimensions of this timber is about 10 inches.

One who has never seen a dense forest of timber would suppose that by this time the capacity of the earth to bring forth forest trees had been well-nigh occupied. But here again our estimation of the bower of nature, is at fault; for in many places, still beneath this tripple forest, is a mat of young Redwood and Fir saplings so thickly set as to defy the efforts of man, or even large animals to penetrate.

We have hitherto had a wrong impression of the character of the country known as the Redwoods, as we had supposed it to be a country, broken up by hills and destitute of soil—neither of which is correct. It is an almost unbroken plain with a soil surpassed in no part of the world—not even on the richest Russian river bottoms.

A SECRET FOR FARMERS.—It is worth knowing that every keeper of cows may cause them to calve in the day time, instead of night or day, as it may happen, causing much watching and want of sleep. The simple method is this: when the cow is in calf and the milk beginning to fail, let no milk be taken from her during the day, or at night, but milk her any time in the morning, and let none be taken *but in the morning*; and, when her time to calve has come, she will drop her young in the day time. Two of our friends have tried this simple method, and found it correct in every case. One who has 18 cows has tried it these two years, and now never thinks of sitting up at night.

OREGON CROPS.—The Oregon Farmer of July 1st, says: The prospect is—indeed it may be set down to be certain—that there will be a great deficiency in the crops of Oregon the present, as compared with the last year. This has grown out of two facts. There was a general belief in some quarters last fall, that the raising of wheat would not pay and no great effort was made to sow fall wheat; the winter and spring proved to be unfavorable for sowing, and much land intended for sowing, and much land intended for wheat, has not been sown. The same general facts may be stated in regard to other crops. The result we believe will be that the crops of the country the present season will not amount to more than half as much in quantity as last year.

CHINESE GARDENS IN AMADOR COUNTY.—The Chinese in the vicinity of Jackson, says the Ledger, are pretty extensively engaged in gardening. Above and below town, on the different branches of Jackson Creek, squads of them can be seen daily, (Sundays not excepted) early and late, industriously tilling the soil. Some of them lease the land for a series of years, giving in exchange for the use of it, whatever improvements they may make, in the way of rendering the soil susceptible of cultivation. This is a very good arrangement for both tenant and landlord.—The former irrigate and enrich the soil in order to make the business pay, while the latter are put in possession of valuable property at the expiration of a few years, which would be of little value without the expenditure of a good deal of labor and money.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our before extensive establishment, we can confidently announce to the public that we now have
The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp Shoes and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Muley, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Metcalf's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goldard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Tusla Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Smut Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to.

Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on this ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before? It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe.
Bartlett Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco.
Ogden & Wilson, }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be hoisted, thrown in or out of gear, without the driver leaving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter-bar being hinged to the machine, can be packed up without removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchasing.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC TITLE American Patent Agency of Messrs. Munin & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REJECTION, and for appealing it to the Commissioner, no additional fee will be required. In cases of Interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as a gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

Machinery in the Useful Arts.

A correspondent of one of the New York papers, journeying in Massachusetts, thus describes some new applications of machinery to the mechanic arts in that busy industrial hive: "The extent to which machinery is taking the place of hand labor is strikingly illustrated in making ladies shoes. I recently visited a manufactory in Haverhill, Mass., where, with the machinery in use, twenty-five persons turn out 600 pairs daily. All the stitching is done by sewing machines run by steam—a combination of the two greatest mechanical inventions. Every operation except fitting the shoe to the last, even to the final polishing, and cutting the pegs out of the inside to prevent them from hurting the foot, is performed by machinery.

"One of the greatest curiosities is the pegging machine, which inserts the awl, cuts out the pegs from a strip of wood and drives them in all at one operation, and so rapidly that it will peg two rows around the shoe in twenty seconds. The facilities in this manufactory are such that the raw calf skin and sole leather can be taken in the basement of the building and in half an hour turned out in the form of a complete pair of shoes!

"A stroll through the Pacific Cotton and Print Mills in Lawrence, a few days since, gave me a vivid impression of the vastness of the manufacturing interests of that young city. I had often observed the factories before from the car window,

but did not realize the greatness of the whole until I had seen something of the details. The Pacific Mills consist of two buildings, each nearly nine hundred feet in length. Their full complement of employees is now twenty-one hundred, and will be twenty-seven hundred as soon as the machinery is all set up in an extension of the main building, just completed.

"The raw cotton goes in in bales at one end, and comes out at the other manufactured goods, ready for market. Curious ladies, by strolling through the print and delaine departments, can learn what styles are to prevail several months hence. I will not attempt to tell you how many yards of plain cotton cloth, prints, lawns and other goods can be turned out in a week; it is too far up among eiphers for me to venture. One of the machines for printing delaines, stamps the piece with sixteen different colors and shades of colors in passing through once. There is only one other like it in the world.

FAILURE AMONG FARMERS.—The *Stockton Republican* says that several quite heavy failures have occurred among the ranch and stock men of that county within a week or two. So many have not taken place within the same period of time for many years. The *Republican* could name at least six who have been considered wealthy, who have been completely broken up in business within the past ten days.

The "Miners Companion and Guide," by J. SILVERSMITH, will be ready in about ten days.

DEVOE & CO.,

STEAM ENGINE AND MACHINE WORKS,

Corner Market and Fremont sts., San Francisco.

All kinds of machinery, such as Steam Engines, Sawmill Irons, Flour Mills, Quartz Mills, etc., etc., made to order and repaired.

A CALIFORNIA INSTITUTION!

AS A REAPER.

AS A MOWER.

STANDISH'S IMPROVED COMBINED REAPER AND MOWER.

Since the appearance of the first reaping and mowing machines, men of mechanical genius have been busily engaged in their improvement, until at last we have a combined reaper and mower invented by an ingenious Californian, which will probably supercede all others at present in use. The inventor is Mr. P. H. Standish, at present residing at San Jose, Santa Clara county. The superior merits of this machine exist in the facts that, 1st—It is capable of doing more work in a given time than any other reaper and mower. 2d—That it does its work in better style. 3d—That it is simpler in construction. 4th—That it is less liable to get out of repair. 5th—That if it does get deranged in any manner, it can easily be repaired, and at trifling cost. 6th—That its price is infinitely less than that of any other machine. For the information of our farming friends we would state that we have secured the sole agency for this State, of this invaluable invention, and shall be happy to see or hear from any of them who desire to purchase county rights, or single machines. Letters must be addressed to "J. Silver-smith, Government House, San Francisco." We warrant the machine to give every satisfaction to purchasers. We are also ready to negotiate with Agricultural Implement makers, for its manufacture. A working model may be seen at the office of the MINING AND SCIENTIFIC PRESS, in San Francisco.

A number of these superior Reapers and Mowers are now in use in this State, and are highly spoken of by their owners. A few of the testimonials we have received are appended:

PACIFIC, June 28th, 1860.

We would say to the farmers generally, that we have tried Mr. Standish's new patent reaper, and have found it to be the best we have ever seen! It runs much easier than others, is less complicated, and not so liable to get out of repair. We would respectfully invite all who want to purchase Reapers to call and examine for themselves, for we are confident they will be pleased.

JOHN W. BROWN, CHARLES MORGAN.

STEINMAN'S REVERE HOUSE.

The Revere House.

This excellent hotel, which has been established so many years, and has earned so large a popularity is, as will be observed, faithfully represented in the accompanying engraving. It is situated on the south side of Pine street between Montgomery and Sansone streets. The proprietor, Mr. J. Steinmann is one of the most affable of gentlemen and genial of hosts, and as all the rooms in the establishment are scrupulously neat and clean, the table covered with all the luxuries of the season, the prices for board and lodging very moderate, and the building situated in a convenient locality, we are happy to warmly commend it to our friends and readers, coming down from the mountains.

TEETH! TEETH!
Extracting without Pain! DR. W. H. IRWIN, Dentist, Third st., near Howard (opposite Estlin's Mansion). All branches of Dentistry performed in the neatest manner.

Extracting, each, \$1.
Straightening children's teeth, 50 cents.
Filling with gold, each, \$1, \$2 and \$3.
Filling with platinum cement, \$1, \$2 and \$3.
Cleaning, whitening and burnishing, \$2, \$3 and \$5.
Straightening, etc., from \$2 to \$5.

Nerves killed and Tooth-ache cured, \$1.

near Howard.

Mining and Scientific Press.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. III.

SAN FRANCISCO, SATURDAY, AUGUST 3, 1861.

NO 19.

A VALUABLE MILL-SITE.—The Folsom Telegraph, in the course of a long article concerning the Granite Flouring Mill, on Slate Bar, on the American River, about a quarter of a mile from Folsom, says:—"The water-power upon which this mill is erected is one designed by bounteous nature for such a valuable and available institution as is now upon it. The head race is 1500 feet in length and excavated through solid granite and stubborn boulders; this is the only complete natural water-power in California. The tail-race is 500 feet and cut through similar material as the head-race. The estimated power of this head-race, at low-water, is 4,000 horse-power, and capable of running all the works that can be put upon its line. The cost of the entire mill and works, including the addition now being put up, is estimated by Mr. Stockton at \$70,000. It will be remembered that this is the water-power, location and property which Mr. Stockton offered to sell to the State last winter for a State Prison site, for the sum of \$200,000, and he to put \$40,000 worth of improvements upon it. The State refused to purchase this valuable property because it considered the demand exorbitant, and by its refusal has forever lost the chance to procure as valuable and available a piece of property for the same amount of money. It cannot now be purchased for \$300,000, because it will realize its owners more than that amount during the next five years."

THE PRINTING OF CALICOES.—The patterns on printed calicoes and similar printed cloths consist, as is apparent on the slightest examination, of a continual repetition of the same figure. This figure, whatever it be, so far as it consists of a single color, is engraved upon a copper roller, the length of which corresponds with the breadth of the calico, and the circumference of which corresponds with the length of the pattern. In general, in such cases, the breadth of the pattern being very much less than that of the cloth, it is repeated many times in the width. This pattern is therefore engraved upon the surface of the roller, the length extending completely round it, and being repeated throughout the length of the roller in the same manner as it is intended to appear on the cloth. This roller receives the coloring matter by a certain apparatus which first smears, and then wipes it, so as to remove all dye except what fills the incisions of the engraving. The cloth is then passed between this roller and another which has a soft surface, the two being pressed severely together in their line of contact. By this process the color deposited in the lines of the engraved roller, is transferred to the cloth, and the printing is completed. When patterns in two colors are to be printed, a second engraved roller is provided, carrying upon it the pattern corresponding to the second color, and the cloth, after having been printed with the first color, is made to pass in contact with this second roller.

THE NEW STATE CAPITOL.—On the 24th inst., the bids for building a Capitol for the State of California at the city of Sacramento, were opened and found to be as follows:—Nolan, \$93,000; Nongoes, \$88,000; Rielardson, \$94,400; Blake & Connor, \$99,250; Nagle, \$100,000; Nevet, \$110,000; Bennett, \$112,000; Rann, \$115,000. The bids for this contract are for mason work only. After carefully examining the various bids, the State Capitol Commissioners awarded the contract to Messrs. Blake & Connor.

AN EARTHQUAKING BENEFACITOR.—San Ramon was greatly benefitted by the recent earthquake. It gave birth to a number of springs, which have been running ever since, so that large droves of cattle could drink where all was dry before. So great is the volume of water from some of them that creek beds formerly dry, are now covered with running water. The ranchmen in that neighborhood are delighted.

AN OVEN.—In a recent lecture, Prof. Blake stated that Fort Yuma was the hottest place in the United States, the thermometer frequently standing 117 degrees in the shade.

MATTESON'S "HYDRAULIC DERRICK."

For description of Matteson's "Hydraulic Derrick," see article headed "Hydraulic Wheel Power," on the fourth page.

SILVER PREMIUMS.—A committee appointed by the State Agricultural Society for the purpose, has contracted with J. W. Tucker of this city who will furnish some 350 pieces, to be manufactured by Vanderslice & Co., of Washoe silver of the fineness of United States coin. These prizes will consist of pitchers at from \$75 to \$50; salvers at \$20; creamers at from \$50 to \$30; ice bowls at \$40; goblets at from \$10 to \$50 per pair, and a variety of other useful and ornamental articles. The arms of the State will be wrought on one side of most of these articles, and the seal of the Society on the other. Each article will contain upon it a design adapted to the department, whether agricultural, mechanical or otherwise, to which it is awarded. The entire contract will amount to a little over \$6,000.

FILE-CUTTING MACHINERY.—An efficient, well working, file-machine has long been a desirable apparatus, and the operation has generally been considered to be one not admitting of the application of machinery. But operations much more difficult than cutting files have been and are performed by machinery, in various manufactures, among which may be named the combing of wool, in which, by the manipulation of the machine itself, the long fibres are selected and delivered into one compartment, and the short fibres into another—an operation which, at first sight, would appear to require an intelligent and discriminating power.

The actual process of file cutting is, however, one of the simplest description. It consists in driving a chisel of suitable form and inclination to a small depth into the prepared surface of the blank, and steadily withdrawing it again; and cutting a file is merely a repetition of this process. The difficulties are—to present the blank perfectly parallel to the cutting edge of the chisel; to withdraw the chisel from the incision made in the blank without damaging the edge of the newly raised tooth; to prevent a rebound of the chisel after the blow which drives it into the blank, and before the next blow is struck; to give a uniform traversing motion to the blank, insuring regularity in the teeth; to proportion the intensity of the blow to the varying width of the file, so as to give uniform width of cut; and to perform these operations at such speed as to make them commercially profitable. In most machinery devised to accomplish this process, the idea has been to construct an iron arm and band to hold the chisel, and an iron hammer to strike the blow, and by this means to imitate as nearly as possible the operation of cutting by hand. The difference in the material used invariably led to failure; the flexible, and to some extent non-elastic nature of the fingers, wrist and arm, enabled the man to hold the chisel, strike the blow, and then lift the chisel from the tooth without vibration; but not so when the iron hand and hammer are tried to perform the same operation.

THE HENNESSY PASS ROUTE.—The *Appeal* says:—If the road by this great route had been put in first-rate order two summers, or even one year ago, there would be a wealth-conferring stream of travel and trade pouring over it, making Marysville the liveliest town north of San Francisco, and hurrying up those turtle-paced railways that everybody is cursing and praying for. But just now we desire only to notice the gratifying fact, mentioned by the Nevada *Journal* that 125 men are at work on the unfinished sections of the Hennessy Pass Turnpike, which will positively this time be finished, by the middle of September at farthest, when the road will be equal to any mountain highway in the world. The travel over it is already great, and constantly increasing. Sixty loaded teams were counted within a few miles by a traveler. About 200 persons have started to go over it from Nevada within a few days, and many from North San Juan and towns in Sierra county. Mr. Haworth, President of the California Stage Company, is on the route now, examining it to see if it is in sufficiently good condition to warrant putting a line of passenger coaches thereon, as the Company has always intended doing as soon as possible.

EFFECTS OF ALCOHOL UPON HARES.—The *Gazette* of Cambray, France, gives an amusing account of a party of intoxicated hares. Fifteen of these creatures are said to have entered the garden attached to a distillery in the neighborhood of Lille, and having eaten the bark of the hoops, or some other substance saturated with alcohol, performed exceedingly fantastic tricks, leaping, tumbling, and screaming in the most extraordinary manner. The workmen, who were witnesses of the scene, broke out into peals of laughter, but nothing frightened the hares, who had their grog aboard, and were full of dutch courage. They were all subsequently taken prisoners, and doubtless furnished a good repast for their captors. A severe punishment for the first indiscretion.

California to Oregon Overland.

In the Oregon Farmer we notice an interesting account of an overland trip from Sacramento to Portland, written by J. B. Knapp, portions of which we append. The writer traveled by stage-coach:

Leaving the Sacramento valley and river at Red Bluffs, the country is rough and hilly to Shasta, with very little land suitable for tillage, except on the Cottonwood. From Shasta to Yreka the country is decidedly mountainous, the road passing over Trinity and Scott mountains at a high elevation by a tortuous course around the rocky points and angles, and along declivities so steep and at such dizzy heights as to give me a feeling of insecurity as we followed the narrow track—a notch or shelf as it were—cut into the side of the mountain. The whole ascent from the base to the summit is about five miles, with a continued easy grade of about 15 inches to the rod, so that loaded teams pass easily what would otherwise be an insurmountable barrier to travel. So much for man's engineering skill to overcome natural obstacles. After passing Scott's mountain I came to the conclusion that it would be difficult to find mountains so steep, high, or rocky, that Californians could not render easily passable. At Yreka, which is a neat, thriving mining town of considerable importance, the stage stops over night. From this place to Jacksonville we cross the Siskiyou mountains, which is about the dividing line between California and Oregon. Here the climate, soil and scenery changes. Everything in appearance was emphatically Oregon. So great was the change I remarked to the driver that we must have passed the dividing line, which he assured me was the case. Instead of the warm, dry atmosphere and dusty roads, we found the temperature several degrees colder, damp and chilly, and muddy roads. Descending the mountains we came into Rogue river valley, which, though only a few miles in width, has a fine soil, all fenced up into fine farms which have a thriving well-to-do appearance.

Considerable mining is carried on at Jacksonville which makes a home market for farmers, and the town and surrounding country betokens more thrift and prosperity than any part of Oregon I have visited. Still farmers complain of low prices and hard times. Leaving Jacksonville, we pass down the valley and Rogue river a few miles, leaving which the route takes a northerly direction, passing over a rough, hilly country, crossing a number of small streams running in the direction of the coast, through the Grave Creek Hills. In going from Jacksonville to the Umpqua valley we pass several objects of historical interest to Oregonians—such as Gold Hill, Table Rock, where the Indians fortified themselves to the last war; the remains of several old forts erected by the settlers for self protection; the deserted farm and charred remnants of the house where the heroine Mrs. Harris defended herself and child, and kept a horde of savages at bay for a whole night after her husband was shot before her eyes. Oregonians will remember the thrill of horror when the first news of this outbreak reached us; how Harris fell as he entered his own door, pierced by the fatal shot; how his dying moments, while life was fast ebbing, were spent in teaching his wife how to load and fire his rifle; how successfully she practiced his last sad lesson, heroically defending herself and escaping unhurt with her wounded child.

We passed several houses and fine farms which were deserted during the war, which still remain tenantless. The last object of interest is the passing through the Canyon; all who have traveled South know the Canyon, and few would care to know it the second time if it could possibly be avoided. I should not know which way to travel to find a worse and more difficult road. Were I to attempt a description of it, I should entirely fail, and will only say that although Government expended thousands of dollars in building it, it remains an enduring monument of the incapacity and want of engineering skill in the officers who laid it out. From Canyonville through the Umpqua valley the country changes. Though rough and hilly, the soil is very rich and well adapted to grazing and farming. Still they are so far from market that they are much embarrassed by the hard times and low prices. In leaving Umpqua we pass through the Calapooya mountains, through Pass Creek, which is another few miles of horrible road leading into the head of the Willamette valley, which for beauty, rich soil, fine streams and timber, is hardly surpassed by any country.

The trip, though rough, I found rather a pleasant one. The stage company have stocked the route with first rate teams, coaches and wagons; have intelligent and obliging drivers and agents, and certainly deserve a liberal patronage. The complaint of hard times is universal the whole route, yet all admit that times are no worse than last year, and it is generally conceded that they are somewhat improved. The cost of a through ticket from Sacramento to Marysville to Portland is \$60. If paid only from place to place at the usual rates, it would probably amount to thrice that amount. For the benefit of those who may desire such information, I carefully noted the distances from place to place.

From San Francisco to Sacramento, by water, 125 miles; thence to Marysville, 45 miles; to Oroville, 28 miles; Chico, 23; Tehama, 28; Red Bluffs, 13; Shasta, 45; Yreka, 110; Jacksonville, 65; Canyonville, 75; Roseburg, 26; Oakland, 20; Eugene City, 56; Corvallis, 40; Albany, 10; Salem, 25; Portland, 50 miles. Making a total distance of over 50 miles.

MODERN HARVESTING.—The San Joaquin Republican gives the following graphic description of our improved modern style of harvesting: The header, which looks at a little distance like a steamboat stern wheel, turning the wrong way, with four horses abreast following, and gazing intently at it, does the cutting. Keeping even with the header, at the left is a sort of four-horse scow on wheels, the horses being ahead. The hox is about 20 feet long and 10 or 12 wide. The header picks up the wheat which it cuts, and it is carried up an apron with buckets moved by belts and wheels, through a kind of large wide flume, called an elevator, into the cart. By the time one cart is full an empty one comes up and receives the grain, the one which is filled starting for the threshing machine. This is fixed for the war, that is until the wheat of the field is threshed. There is a platform on one side of the machine upon which the grain from the wagon, which is driven close to it, is tossed. There are five or six men busy in this work and passing it to the "feeder," who lets it into the threshing just as fast as it will be safe for the machinery. So great is the dust that the feeder is compelled to wear a wet sponge over his mouth and another over his eyes. The straw comes out at one place, the chaff at another, and a very good stream of nice looking wheat out at a third. The wheat fills the measure set under it, and is then emptied into the bags, one hand being kept busy sewing them. The straw "tailings" are swept out of the way by a simple sweep of a one-horse contrivance.

PHELAN'S BILLIARD SALOON.

THE ABOVE BILLIARD SALOON, WITH EIGHT FIRST CLASS PHELAN TABLES, is now open to the public. The Cushions on these tables are the latest patent, and are a great improvement on their predecessors. The ROOM is fitted up so as to combine ELEGANCE with COMFORT. The BAR will be kept constantly supplied with the very choicest brands of

WINES, LIQUORS AND SEGARS,

And the subscribers hope, by strict attention, to merit the patronage of all who admire and practice the GAME OF BILLIARDS. DAN LYNCH, 720 Montgomery st. op. Metropolitan Theatre. M. E. HUGHES.

The subscriber begs to inform the public that the above mentioned Billiard Saloon is also intended to serve as a show and salesroom for

Phelan's Patent Combination Cushions and Model Billiard Tables,

And Billiard Trimmings of every description. Parties desirous of purchasing Billiard Tables will thus have an opportunity of selecting from a varied assortment, both in style and finish, and can also test the superiority claimed for the Cushions and Tables. Mr. DAN LYNCH will always be on hand, and ready to give all required information with regard to the merits of these JUSTLY CELEBRATED BILLIARD TABLES. The subscriber cordially invites all interested parties to call and examine. M. E. HUGHES, Agent for Phelan's Patent Combination Cushions and Model Billiard Tables.

BERGER'S BIJOU BILLIARD TABLES,

With PHELAN'S PATENT COMBINATION CUSHIONS.

The subscriber desires to inform the public that he has now on exhibition at

Phelan's New Billiard Saloon,

Montgomery street, opposite the Metropolitan Theatre one of the above mentioned BILLIARD TABLES, and cordially invites the patrons of the noble game to call and examine it. The great Master, Mons. Berger, speaks of the Tables in the highest terms of commendation. To private families these Tables commend themselves, especially on account of their convenient size, and as an article of furniture for a private dwelling there is nothing more desirable; in short, no household or mansion with any pretensions to being well regulated, should be without one. Gentlemen about to build residences should by all means make provision for a BILLIARD ROOM, where their family can enjoy the noble, graceful, and health-giving game of Billiards.

And Agent for PHELAN'S PATENT COMBINATION CUSHIONS, etc., etc. Exhibition and Salesroom, No. 720 and 722 Montgomery street, 720. Manufacturing, Market street, opposite Orphan Asylum. Jy13

WATER! WATER!! WATER!!!

Water will be let into the pipes of the Spring Valley Water Works, this afternoon, (July 19) in addition to that heretofore let on, in the following streets:

In Brannan, from the corner of Harris to Third street. In Third street, from Brannan to Townsend. In Third street, from Brannan to Folsom; including South Park. Also, from corner of Third and Harrison to Harrison and Fourth streets. All parties desirous to have the water introduced into their premises will please make application for the same, at the Office of the Company. Jy20 A. W. VON SCHMIDT, Chief Engineer.

OFFICE OF THE SAN FRANCISCO AND SAN JOSE RAILROAD COMPANY, San Francisco, July 10, 1861.—Notice is hereby given that a meeting of the Stockholders of said Company will be held at the office of said Company, in the city of San Francisco, on the SECOND MONDAY (the 12th) of August next, commencing at 10 o'clock A. M. and closing at 4 o'clock P. M. on said day, for the purpose of electing seven Directors of said Company, to serve for the ensuing year. By order of the Board of Directors of said Company. Jy20 T. DAME, Secretary.

A Word to California Farmers.

We observe that the millers of California are bent upon making the farmers furnish them clean instead of dirty wheat. The millers of Yuba county, according to the *Appeal*, have declared that they will not encourage this nuisance any longer, and producers may be sure that wheat which was the refuse of their threshing ground and a heterogeneous admixture of unmerchantable rubbish in it, will find its proper price, and be classed with "rejected" or "inferior," when, with due care, it might command the highest current rates. There is no excuse, with the present present prices, for such a shiftless policy as has heretofore been pursued by our farmers, and it is to be hoped that this year's crop will be able to redeem the reputation of California wheat in foreign ports.

The *Napa Reporter* says, in connexion with this subject: We see by some of our late exchanges, that the large quantities of barley, oats, etc., present in the wheat shipped from California, has tended materially to depreciate it in value; and our farmers, and all interested in the grain business, should pay particular attention to this fact if they want a market to ship their surplus grain to. Practical millers have always felt the want of complete and perfect machinery for cleaning grain, or rather separating not merely wheat from the chaff and foul matter, but the wheat from the oats and other grain, which is often mixed in growing; and ingenious mechanics have experimented a great deal in trying to produce the machinery so much desired. Hitherto, but partial success has attended their efforts. It is with great pleasure then, that we call the attention of our farmers, millers, and the interior press, to the fact, that this want can now be supplied by the purchase of Turner's Improved Combined Smutter and Grain Separator—the most perfect machine of the kind in the world. It has no equal in scouring, separating, and otherwise cleansing grain from smut, chaff, grown wheat and other impurities. As wheat always contains, when brought to market, more or less smut, dust, chaff, and other foul stuff, and in passing it through a smut mill, if the grain be the least damp, the smut, dust, etc., are liable to adhere, it is absolutely necessary that the smut balls should be taken out unbroken, before the grain enters the Smutter, and the dust pass out as soon as scoured from the berry, that the grain may not wallow in it.

In this machine, the Smutter is composed of from three to seven sets of horizontal scouring plates between which the grain passes. The lower plate or runner of each set is provided with beaters, which throw the grain against the upper plate, which is stationary and also provided with beaters, thereby causing the grain to act against both plates with equal certainty and uniformity. A rough or sharp surface is not depended on for scouring, but it is claimed that what the machine will do the first month it will continue to do for years in the same manner.

The grain enters at the top, where it first falls upon a zinc or sheet iron riddle, through which the grain passes, taking off sticks, stones, etc., over it. The grain then falls upon the first inclined plane, then into the first blast from the fan at the bottom of the machine, which takes out most or all of the smut balls, oats, chaff, and other light impurities, before the grain enters the Smutter. This all millers know to be of the greatest importance, particularly if the grain be damp. The grain then passes out of the blast of the Separator into the Smutter, the dust passing through the perforated case opposite each set of plates, and drawn up into the top fan and carried out of the Mill if desired—the grain passing through the Smutter, discharging the heavy screenings at the angle in the enlarged spout.

The Machine is well ventilated, by a blast from the lower fan into the center of the Machine, by which there is no possibility of its ever becoming filled up or clogged with dust.

This Machine makes five distinct separations: 1st. The heads, sticks, etc., over the Riddle. 2d. Screening from the first blast, (which are the lightest), and before the grain enters the Smutter. 3d. The dust. 4th. Screenings from the second blast of the Separator, after the Smutter. These last are free from dust, and in good condition to grind for feed or otherwise. 5th. The clean grain, at the bottom of the Machine.

Only one driving belt is required, and but two in all—and can be as easily attached as any upright Smutter. Rolling screens may be dispensed with, except for cockle.

The step of the Smutter shaft is the only place from whence arises any danger from fire, by the friction of the Smut Mills; hence the absolute necessity of having the step always in sight, and convenient to be oiled, with no liability to run dry, from its situation being unapproachable without taking the Machine to pieces. All millers, and all vigilant and competent Insurance Agents, should thoroughly examine all Smut Mills and report to their principals,—whether the step of the Machine can be examined daily,—its facility for oiling,—its contiguity to wood,—the velocity of the Machine, and its liability to clog with dirt. As sad mistakes have been made in this important matter, all parties interested are particularly requested to examine this Machine. Aside from any danger from fire, the convenience of the miller should be consulted. He is desirous of knowing and should know to a certainty, that the step is oiled and in good order, and this should be able to ascertain with as little trouble as possible, and as often as desired. In this machine the step is always in sight, and can at all times be examined and oiled as easily as any ordinary journal. It holds nearly half a pint of oil, and can at any time be drawn off and replenished. No

grit or dirt can remain in the step, but will be thrown off into a lower cavity. From these considerations the Machine is regarded fire-proof.

Millers and farmers desiring to obtain this valuable machine can do so by applying to J. SILVERSMITH, proprietor MINING AND SCIENTIFIC PRESS, No. 20 and 21 Government House, San Francisco—he being the sole agent for California. He would also be happy to confer with parties desirous of purchasing the right to sell the "Combined Smutter and Grain Separator," in any county of the State.

TO INVENTORS AND DISCOVERERS, MECHANICS AND MACHINISTS:

The undersigned, having had great Experience and Facilities for completing and carrying out Inventions and Improvements upon all kinds of Machinery and Implements, also preparing the requisite Drawings, Models, Drafts and Specifications, and is otherwise conversant with all principles in Mechanics of modern practice, and could prove, therefore, of invaluable aid to Inventors and Discoverers. Those contemplating bringing their inventions in a proper shape before the U. S. Patent Commission are particularly requested to consult the subscriber.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved

AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz.

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.

The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,

HYDRAULIC WHEEL POWER.

Of all the adaptations of hydraulic power to machinery, that of Mr. Edward E. Matteson, of Nevada county, is probably the most valuable. On our first page the reader will observe an illustration of the manner in which he applies this force to the derrick, but this is but one of the almost innumerable uses for which it can be rendered available. Whenever water is cheap, the principle of hydraulic pressure, by Matteson's method, can be brought into play, impelling any fixed machinery, at far less cost and with less risk to property and life than steam or any other motive power. Although not entirely original with him, yet the patentee has introduced great improvements in his machine. We will briefly describe it, as applied to the derrick. The water is conveyed through hose into a tube, from which it is forced into the centre of a hollow S shaped casting, called "the wheel." The water rushes in opposite directions from this point, through the curved arms, which are open at the end. The discharges, as in the case of the fire-works known as Catherine wheels, cause the arms of the wheel to revolve with more or less velocity, at the option of the person in charge, who governs the same by opening or shutting the gates that are attached to the apertures. This "regulator" is, as will be seen in the engraving, very ingeniously, yet simply contrived, the gates being connected by rods with a lever. The wheel is on an axle bar at whose other extremity is a cog-wheel which fits, into another cog-wheel, and thus turns the revolving drum to which the hoisting rope is attached. The power of the wheel and its speed, can be governed in a variety of ways, independent of the regulator. The power is increased, but the speed diminished by lengthening the arms of the wheel, and *vice versa*. The power and speed are both increased by enlarging the apertures of the arms, and increasing the "head" of water; both are also increased by a larger amount of "fall," or in other words, by taking the water from a higher elevation. Water power can be applied by this method in less time, at less cost, and with more satisfactory results than by any other. Matteson's machine costs one-quarter less than an over-shot water wheel. It can easily be taken down and removed to places inaccessible to other machinery. It is so simple in its construction that any one can work it; and is not liable to get out of repair. If it does, the repairs cost but little and can be done rapidly. One of these derricks is now operating at Nevada city. It has a 6-foot wheel, with $1\frac{1}{4}$ in. escape holes, working under a 60 feet pressure, and using but four inches of running water, conveyed into a tank or reservoir, which is drawn from while the wheel is at work. This wheel is of 3-horse power, and can do as much as fifteen men turning the crank of an ordinary derrick. With such great advantages, no wonder that it is becoming a favorite in the mines, wherever it has been put into operation. But, as we before remarked, it is equally valuable for other purposes: for running air-fans in tunnels, circular saws, planing machines, quartz mills, and in fact almost any kind of machinery where the proper fall of water can be had, and in those towns and cities where water is laid on, it can readily be applied to printing presses. We have seen a miniature model, from which our drawing was made, which, when connected with the water-pipe faucet, raised a weight of fifty pounds! From this, some idea of its immense capacity may be formed. The inventor of the "hydraulic derrick" is the same gentleman so justly famous for his application of hydraulic power to mining operations. We can regard him in no other light than as a great public benefactor—and as such, we think that our State Legislature should, long ago, have voted him a testimonial. He has done more towards developing the mineral resources of California than any other living man, and services such as his should certainly meet with official recognition and reward. Yet this man of inventive genius is now poor and obliged to earn his daily bread by the sweat of his brow, whilst thousands of our citizens have reaped the harvest of his planting!

Swamp Land Commission.

The Board of Swamp Land Commissioners, says the Sacramento Bee, held their regular meeting last week, commencing on Tuesday and adjourning on Saturday. The work laid down for them in the swamp land Act is just being developed, and at an early day will attract much of the public attention. We intend now to give the public an outline of what has been done, and shall refer to the manner of doing it in future.

There were present at the last meeting, A. M. Winn, President; Wm. J. Hooten, Secretary; B. B. Redding, and T. T. Boulden—James C. Pemberton, of Tulare, being absent. Reclamation districts are made by the Board as the petitioners desire, so that they include all the land susceptible of one mode of reclamation.

District No. 1 lies above the city, and between the American, Sacramento, Feather and Bear Rivers, and contains 60,000 acres—showing to its credit in the Swamp Land Fund \$25,048. It was organized, and George H. Goddard was selected Engineer May 29, 1861. At the last meeting there was allowed, for work done on this district, the sum of \$433 75, being the first and only district for which an appropriation has been made. Engineer's report expected next meeting.

District No. 2 is all the swamp land lying between Sacramento city, Sacramento river, Tyler's slough, the Mokelumne, and Cosumnes rivers, and the high lands; containing about 60,000 acres. Something like \$25,000 has been paid in for lands in this district. It was organized May 30, 1861, and the Engineer elected June 20, 1861. The Engineer and his corps are at work, and a report is expected from him at the next meeting.

District No. 3 is that tract of land known as Grand Island, lying below this city and adjoining No. 2. It was organized in May, and on the 29th of July, A. G. Winn was elected Engineer, who reported the first survey, from which we learn that the whole number of acres in his district is 16,448.14; of which the State has sold 10,676.14 acres; vacant, 2,274.39 acres; amount sold by the State and claimed by the United States, 921.39 acres; amount paid in on the district, \$4,063 48.

District No. 4 is also in Sacramento county, known as Tyler's Island, and lies adjoining No. 2 and 3. It contains 8,000 acres. The amount paid in is \$2,056 72. The petition was filed July 16th, and Andrew R. Jackson was elected Engineer July 18, 1861.

District No. 5 is in San Joaquin county. It extends from a slough near the south boundary of township 4 north, range 4 east, and to a bend in the Mokelumne river. It contains 20,000 acres; sold by the state, 13,125 acres; still vacant, about 6,875 acres; amount paid in, \$5,900 77. The petition was filed in July, and on the 20th of the same month, G. C. Holman was elected Engineer.

District No. 6 is in Tulare county, on the Cawiah river, containing 5,280 acres, and supposed to be claimed by the Tulare Company. The petition is still in the hands of the Committee on Petitions.

District No. 7 is in Solano county, and is bounded by Lendar slough, Ulpio's rancho, and the high lands—contains 1,000 acres—organized June 21, 1861, and John T. Peabody elected Engineer.

District No. 8 is in Sacramento county—known as Andrus Island, and is lying alongside of Tyler's Island. It contains 7,264 acres. The amount that has been paid in is \$1,472 41. Andrew R. Jackson was elected Engineer, July 28th, 1861.

District No. 9 is in Solano county, and is adjoining No. 7. It contains 1,860 acres. All sold. Amount paid in, \$548 72. Petition filed and John F. Peabody elected Engineer, July 17th, 1861.

District No. 10 is in Solano county, on the Sacramento river, and in township 3 north, ranges 1 and 2 east Monte Diablo meridian. Contains 1,138 acres. All sold. Paid in, \$985 81. Petition filed, and I. P. Marshall elected Engineer, July 17th, 1861.

District No. 11 is in San Joaquin county, and as it does not include all the land susceptible of one mode of reclamation, it is withheld for the present. It contains 1,487 acres. Paid in, \$416 39.

District No. 12. The petition for this district is in the hands of the Committee on Petitions. Some informality prevented the Board from acting on it at the last meeting. It is a small district, and does not seem to include all the land susceptible of one mode of reclamation.

The Board has performed that portion of their duty requiring them to furnish the laws, instructions and blank affidavits to the County Surveyors—to enable them to properly segregate the swamp lands from the high lands, or lands belonging to the United States.

CONFLAGRATIONS.—During the past week La Porte, a thriving mountain town in Sierra county has been totally destroyed by fire—loss \$166,000; Columbia suffered about \$50,000 damage by the same element; and Forestown about \$35,000; besides the losses experienced in this city by two fires on Davis street. At La Porte the office and material of the Mountain Messenger were destroyed, much to our regret, as it was one of our most valued exchanges. We are glad to learn however that Messrs. Dewey & Byrne will purchase new material without delay, and continue their interesting paper.

A CHAPTER OF MIRACULOUS ESCAPES.—The Tuolumne Courier says that Thos. Newton, or "Texas" as he is generally called in Sonora—the same who was so desperately stabbed the other day—is a most remarkable man for his narrow escapes from the clutches of death. He was with Walker in Nicaragua; and in one of his battles, as the rear guard he stood the fire of the whole enemy, for ten minutes—while the balance retreated—until shot through the breast, and left for dead on the field. In collecting the corpses, he was helped up with other bodies, under two dead soldiers; but not long afterward surprised his comrades, while eating supper, crawling into camp. In crossing the plains, as an U. S. teamster, he was shot through the breast with an arrow, from side to side, in an action with Indians, which wound was pronounced fatal; but contrary to expectation, he recovered. When nearly well, the troops again got into action, and he was once more shot in the breast with an arrow. This last gave him so much pain that he begged a comrade to pull it out; which he did by drawing it out from behind. This time, every one thought that he would certainly die; but he again recovered. It seems almost impossible to kill him. He has not any way the appearance of a desperado, yet when he gets fairly engaged in a fight, few men are more desperate and brave. His life has been an exciting one and dangerous. His breast is literally covered with scars from wounds received in his numerous encounters. Naturally, he is of a rather mild disposition, good-humored and obliging.

SINGULAR NATURAL FORMATION.—In speaking of Horse Shoe Bar on the middle fork of the American river, the Placer Courier says: We scarcely know how to describe this locality—this truly strange freak of nature.—At an early day, when the sea receded from these mountains, river channels were formed, and the sides of the mountain were washed down to the bed rock by the powerful hydraulic process of them times the "piper" seems to have been on a "bender," for instead of directing his pipe to the cutting through of a small back-bone about thirty feet through, and about the same height he seemingly was trying his hand to cut through a mountain two thousand feet high in an opposite direction, until he appears to have given it up as a 'bad job,' and then, without attempting to remedy his work, he left a thin back-bone almost half a mile long standing "solitary and alone," with the roaring river on each side, within a stone's throw, while the distance around by the river channel is not less than a mile. Horse Shoe Bar is a very good name to give the place, but "the Devil's Tail, or the forked tongue of the Firey Dragon" would have applied better to the island.

A CASCADE ON THE FEATHER RIVER.—A correspondent of the Appeal thus describes a fine cascade on the Feather river: It is near the head of the south branch of the east fork of Feather river; and, with this geographical item, we eagerly climbed the bluff for a view. I pause, lest my pen should rain superlatives; but of all beautiful pictures, the cascade, framed as we saw it, between two tall pines, was the most striking and exquisite. The water thunders down two hundred and fifty feet, with immense wreaths of spray, and runs off in a gurgling brook. The banks on either side, are almost precipitous, but rich in verdure; while the rocks over which the torrent rolls wall up the ravine—gray, majestic, sculptured, as if by a great master hand."

THE COMING THOUSANDS.—The newspapers of Kansas and Nebraska, brought by the overland mail, represent the thoroughfares on the plains as full of migrating companies, pressing toward the Sierra Nevada. The emigrants are described, in these papers, as of an excellent class, intelligent and industrious, who are bringing considerable wealth with them in flocks and herds of the best blood.

NEUTRALIZING POISON.—The treatment of persons poisoned has hitherto been that of a chemical decomposition of the poisonous substances. It is now proposed to correct their effects by another method—that of administering poisons of a depressing character, to counteract those of an exciting one. This is the new Italian practice. Thus laudanum has been neutralized by belladonna.

SAN LOSS.—We read with tears in our eyes, at the midnight hour, the loss of our humorous and piquant contemporary, the Healdsburg Review. It died nobly!—like "Nero fiddling while Rome is burning," it sparkles in wit, from the leader to the last paragraph. Ah! friend Cox, the life of a country editor must, indeed, be checkered and weary. Better come to San Francisco, and we will give you a show in a respectable humorous pictorial sheet. Come soon, and apply at our office instantly.

THE MINERS COMPANION AND GUIDE.—At the earnest solicitations of many who are extensively engaged in mining on this coast, the publisher of this Journal has complied and at a great expense prepared upwards of fifty highly finished illustrations for this work, which will contain about two hundred pages closely printed matter, from the best sources. This book is more especially dedicated to the Miners, Prospectors, Assayers, and Explorers on the Pacific Coast, in whose hands it must prove highly useful as a necessary companion and sure guide, in all the ramifications of mining occupations. In its historical, statistical, geological and mineralogical points pertaining to the mines on this coast, few works will compare with it for correctness or perspicuity. In shape it is handy, durable, and well bound.

CALIFORNIA.

Butte County.—From the Democrat, we learn that the wheels, flumes, track and other appliances have been reconstructed on the valuable mining claim of Messrs. Faulkner & Dyer, the cars have again commenced dumping the auriferous gravel into the sluice boxes. This claim has been worked for several seasons past, and will probably last for many yet to come. From the methodical manner in which it has been and will be worked, no less than from the richness of the claim itself, it will prove a mighty good thing for its industrious and intelligent owners.

point down to the Palmyra District, (ten miles) all work is suspended. Here, however, some extensive mining operations are going on, the principal of which consists of an immense tunnel, now in progress, through the mountains of this district, to the Carson River, by the same company, in daily expectation of striking a valuable mineral vein in their tunnel. There were not less than five hundred miners in this district at one time last fall. There are not now one-tenth part of that number, though there are a good many engaged in cutting hay, chopping wood, gardening, etc. Opposite the Palmyra District, and about one mile west of Carson River, and a like distance above Chinatown, situated in a sage plain broken with slight ravines, is a piece of mining ground called the "Big Hole," where the famous "Big Hole" mine of this ledge owned mostly by Frenchmen was discovered over a year ago, but owing to a singular indisposition on the part of the proprietors to have anything said about it, few persons were aware of its real character. They have been steadily at work for six months sinking a shaft, which is now down about 40 feet. The ledge at this point is about 14 feet wide. The rock is soft and requires no blasting, being easily removed with the pick. It resembles that found at Gold Hill, while it is as hard as the latter. The ledge is about 200 feet wide, and is now reduced in San Francisco, gave over \$600 to the ton; and yet this seemed scarcely better than the average rock taken from the claim. In fact, it is difficult to select the rock taken from this claim—the whole mass being alike, and paying throughout. Owing to the softness of the ledge, three men can take out from four to five tons a day. It is, for the same reason, easily crushed. The company are now running four astras, and are about starting six more. The ledge is in a very favorable position, and its advantageous situation, it would easily secure one of the best pieces of mining ground in the Territory; and had it been owned by a different class of men, it would have been selling for as much as any other. There is a good deal of prospecting being done in the neighborhood of the Duncy, in the hope of striking something equally good. Considerable ground has been taken up, some of which promises to be valuable. Between this place and Virginia City, a large number of claims have been taken up, and a large number of men are now working in the various departments of mining. This section is now being more worked than any other in the Territory, it having been discovered that the ledges are more likely to pay than those in the outside districts. Here, too, most of the mills are situated, which imparts additional value to the mines by affording facilities for reducing the ore. Their proximity to Carson River is also greatly to their advantage, as the extensive water-power of this river can be used to great advantage in the mills. It is well known that there is a large stream in all other places together in the country. In consequence of the greatly-reduced price of crushing rock, numbers of claims about Silver City that had been looked upon as valueless are now appreciating in price as they can be worked with profit. The upheaved mass of rock constituting Gold Hill proper is now being penetrated from every direction, and torn to pieces at a fearful rate by means of deep shafts, drills and open cuts. The noise and the roar of the quartz mills and the rattling of the rocks through the lofty shoots projecting from the mines never ceases. The town, occupying a wretched site along a deep gorge, has had a rapid growth, having more than doubled its population—now some two thousand—Within the last six months. Some of the best mining grounds at

The Mesilla Times of June 30th, says: Letters from Pino Alto report the recent cleaning up of azarates to be satisfactory to the highest degree. The veins are so astonishingly rich and of such a character as to induce these interested in quartz to continue their operations in spite of the manifold obstacles which surround them. Some protection is anxiously sought against Indian depredations. The Apaches are plentifully prowling about the mines, and are capable of carrying off the most fortified camps. A letter from Antelope city, gives cheering accounts of the San Juan mines. The investigations are daily proving more and more satisfactory, and it is now fully demonstrated that gold exists in abundance and in good paying quantities. Confidence is being restored to the miners, and the success of these mines, and with them the near richly veins at San Juan.

The Successor of King Cotton.

In a recent number of the MINING AND SCIENTIFIC PRESS, we discussed the subject of flax vs. cotton, taking the view that flax would soon supersede cotton, so far as the coarser fabrics are concerned. Since then, we have come across the following interesting extract in a Boston paper, bearing upon the matter: On our great western prairies, and in a large part of Western Canada, there is a species of wild flax, unknown to botanists formerly, which is indigenous, perennial, herbaceous, and inexhaustible in quantity. It was put to no use by the early settlers, except to make straw of for litter. Recently, the seed has been considerably collected for the manufacture of oil, but still later its fiber has been found to be very valuable, and now it has assumed a momentous importance through the means of a very simple invention. The stalks are placed in a cylinder and subjected to an enormous pressure of high steam—250 pounds to the inch. In less than six minutes the contents are blown out or exploded, and the flax comes forth with the fiber divided up, and the husk or covering shattered into infinitesimal parts. It then resembles cordilla or tow. It is next passed through cylinders armed with teeth, which huckle it and smooth out the fibers. It is then washed with nitric acid, and comes out white as snow. It is then carded, drawn out into yarn, and is spun into thread precisely like cotton, and is ready for the loom. Thus the old, tedious and unhealthy process of water-rotting is done away with, and so is that of bleaching, to perfect which chemistry has exhausted itself and large fields of lawn have been indispensable.

The article when ready for spinning, can be afforded at a uniform price of six cents per pound, and enough of it can be gathered wild—though it will be much improved by culture—from our own prairies, to cloth the world with a fabric of the finest and most durable quality. The experiments already made, and the mills already constructed to manufacture it, have furnished the most conclusive evidence of the truth of this magnificent discovery.

Samples of the article, in all its processes, have been forwarded to Manchester, and parties are ready to furnish as many bales of it as all the mills in England may demand."

STATE REFORM SCHOOL.—We paid a visit, a day or two since, to the institution above named, and found the exterior of the building about completed, the walls being up, the chimneys finished and roof put on. The building stands a few rods from a bend of Feather river, on the edge of a hundred acre tract of land, about six miles from Marysville. The approach to the grounds is very pleasant, the composite architecture of the building making quite an imposing appearance, seen through the arches of the oak grove, and relieved by the foliage of the river banks beyond. The structure is two hundred and eighteen feet long and its extreme width is fifty-five feet. The central portion of the building is fifty-three feet high to the top of the fire-wall, and has four stories, the wings being but three stories and have a height of forty-seven feet. The architecture of the structure claims no legitimate school, that we are aware, but has the composite adapted to circumstances style, which usually characterizes California art, but has a dash of the Italian style in it, with a flavor of the Gothic in the battlemented finish of the walls. The openings are made in panels formed by pilasters which rise to the top of the building where they are arched and support a brick cornice of the dentil style, which finishes the top of the wall of the entire building, with a projection of thirteen inches. On the main or centre part of the building a redwood cornice of four feet, bracketed, make the finish. The roof is hipped, covered with redwood shingles, and on the main building will be surmounted with a cupola, from which a magnificent view of the surrounding country can be had; the spires of Marysville rising in the southeast, the purple and snowy Sierras in the east, the rugged Buttes in the west, and nearer, the winding river is shining through the trees.—*Marysville Appeal*

THE SAN JOSE RAILROAD.—The *Tribune* says that ground was broken some two months since at San Francisco Creek, the dividing line between Santa Clara and San Mateo counties. Two miles of heavy embankment have already been completed. A number of men are at work, and the expectation is that about a mile a week will be graded into each county, from the already completed parts. Work is to be commenced in San Francisco county about the 1st of September. The iron has been ordered for the road, and is due here on the first of January. The purpose is to complete that portion of the road where the iron can earliest be used; as the grading can go on of course much faster after the track is laid part of the way.

COMING TO CALIFORNIA.—A Nebraska paper of June 6th says:—Emigration is thronging the thoroughfare, and seldom are the companies so far apart but we can see at least one from our office door. Most that now pass up are for California and Oregon—a few for Washington, Utah and Nevada Territories. A great amount of fine—we may say very fine stock is daily passing. California will receive a valuable accession to her population and wealth this season. Those passing are generally in excellent health, and stock in fine order, and as a whole, the people seem a well to do, intelligent working class.

PRINTING OFFICE REMOVAL.

THE COMMERCIAL BOOK AND JOB STEAM PRINTING ESTABLISHMENT

Has been removed to the New Office,
No. 517 Clay and 514 Commercial Streets.

Book Printing, Law Briefs, Catalogues, Business Cards, Hand-Bills, Circulars, Theatre Work, American Flags, Envelopes, Badges, Bills of Fare, Programmes, Posters, Legal Blanks.

We keep constantly on hand and for sale, an assortment of

NATIONAL FLAGS AND BADGES,

In beautiful and extensive variety. Sole manufacturer of the

NEW UNION ENVELOPE,

With original and Patriotic verses. Everybody should use it.

Our Office is complete and perfect in every respect,

And we shall endeavor, in the future, to merit a continuance of that patronage which we have heretofore so generously received.

VALENTINE & CO., PROPRIETORS.

Please call and give us a trial.

A. KOHLER,

NO. 178 WASHINGTON STREET, SAN FRANCISCO.

Forty Cases of Musical Instruments Just Received,

Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS.

Also, TAMBOURINES, BANJOS, FIFES, FLUTES, CLARION PICALOES, VIOLIN BOWS, BOW-HAIR, ROSIN BRIDGES, PEGS, TAIL PIECES, FINGER BOARDS, TUNING FORKS, SIX ROMAN STRINGS (four lengths and four thread), and

ALL KINDS OF MUSICAL INSTRUMENTS,

Fresh every two months from Italy.

All of these goods will be sold to the trade, as they are direct importations from the manufacturers of Europe, and imported in large quantities by A. Kohler. He will sell them twenty per cent. cheaper than any other house in California; therefore it would be the interest of all to call and examine before purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by the case.

The wholesale department of this House is on Sansome street, occupying the whole block from Clay to Commercial street. mh5

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Potosi, \$175 per share.
Central, \$625 per share.
Ophir, \$1000 per share.
Gould & Curry, \$225 per share.
Chollar, \$15 per share.
Lucerne, \$20 per foot.
St. Louis, \$4 per foot.
Mount Davidson, \$60 per share.
Mark Anthony, \$8 per foot.
Louise, \$18 per share.
Bradley, \$5 per foot.
Sacramento, \$10.
Shelton Co., \$3 per foot.
Josephine, Flowery, \$10.
West Branch, Flowery, \$7.
Harrison, Flowery, \$12.
Yellow Jacket, \$25.
Exchange, East Comstock, \$40.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$16.
Ohio and Buckeye Co. Argentine, \$12.
Chimney rock, \$15.
Dugren, \$10.
Rich Co., \$3.
Miller, \$12.
Augusta, \$6.
Spanish Co. Plymouth Ledge, \$6.
Chelsen, \$8.
Caney Ledge, \$25.
King Charles, at Flowry, \$6.
Edgar Co., Great Western Ledge, Geleena, \$20.

Number of Shares, to the Foot.

Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.
[Having completed all the requisite arrangements, we lay before our readers a reliable list of prices of mining stocks of Utah.]

NOTICE.—THE GENTLEMEN OF SAN FRANCISCO ARE RESPECTFULLY informed that their NEW BILLIARD SALOON, with EIGHT FIRST CLASS PHILAN'S TABLES, will be opened for business on SATURDAY, Jan 29th, 1861. The undersigned respectfully solicits the patronage of all GENTLEMEN Billiard Players, and hope by conducting their Saloon in an unexceptional manner, to merit their continuance and support.

WHEELER & WILSON'S

FAMILY SEWING MACHINES!

NOT ONLY

THE BEST FOR FINE SEWING,

BUT THE BEST FOR...

MANUFACTURING CLOTHING

...AND...

OTHER HEAVY WORK.

SAN FRANCISCO, June 6, 1861

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Fannel Shirts, Camere and Tweed Suits, etc., from materials made at the Mission Wool Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them is not to be surpassed.

Various styles of Machines have been employed on the above materials, but the Wheeler & Wilson is preferred.

DONALD McLENNAN,

Proprietor of the Mission Woolen Mills

July 6

BEES CULTURE IN TUOLUMNE.—A large number of the citizens of this county says the *Columbian Times*, having entered into the speculation of raising bees, it may probably be interesting to the residents of other counties to know with what success. We have watched the progress of the experiment of bee raising in the mountains with considerable interest and have been pleased to have been able to record its success, but the regard for the truth compels us to state that it has been almost a complete failure, which we attribute almost wholly to the want of food for the bees. For at this season of the year, every kind of wild vegetation not in the immediate neighborhood of water, is arid and parched, while the gardens and orchards, though numerous and rich, are wholly insufficient for the sustenance of the many swarms introduced into the county within the past year; the consequence is, that the furnishing of food regularly besiege the hives of those more fortunately located, and devour their honey. Through these fights thus occasioned, nearly every apiarist in this vicinity has lost from one to twenty swarms. Though the experiment of raising bees in the mountains has thus far been a failure, we are not without hope that it may yet prove successful. In California there is such a superabundance of enterprise and energy—such a general desire to develop the countless resources of our richly-gifted State—that the moment any one enters upon a new path of product or industry, promising even a reasonable success, hundreds and thousands rush in the track, and in place of following the original explorers to feel their way cautiously along, to grope their way along the new path, crowds rush in and so obstruct the way that ruin overwhelms them all. This has been the case with almost every new enterprise introduced and this in our humble opinion has been the cause of the failure of the bee experiment in this county. To rush 700 or 800 swarms of bees into a district where there is but food for less than half that number, must result in disaster to all.

Standish's Combined Reaper and Mower.

Since the appearance of the first reaping and mowing machines, men of mechanical genius have been busily engaged in their improvement, until at last we have a combined reaper and mower invented by an ingenious Californian, which will probably supercede all others at present in use. The inventor is Mr. P. H. Standish, at present residing at San Jose, Santa Clara county. The superior merits of this machine exist in the facts that, 1st—It is capable of doing more work in a given time than any other reaper and mower. 2nd—That it does its work in better style. 3rd—That it is simpler in construction. 4th—That it is less liable to get out of repair. 5th—That if it does get deranged in any manner, it can easily be repaired, and at trifling cost. 6th—That its price is infinitely less than that of any other machine. For the information of our farming friends we would state that we have secured the sole agency for this State, of this invaluable invention, and shall be happy to see or hear from any of them who desire to purchase county rights, or to lease machines. Letters must be addressed to "J. Silverthorn, Government House, San Francisco." We warrant our machines to give every satisfaction to purchasers. We are also ready to negotiate with Agricultural Implement makers, for its manufacture. A working model may be seen at the office of the MINING AND SCIENTIFIC PRESS, in San Francisco.

A number of these superior Reapers and Mowers are now in use in this State, and are highly spoken of by their owners. A few of the testimonials we have received are appended:

LAFAYETTE, June 27, 1860.

MR. P. H. STANDISH—Sir: We, the undersigned, did on or about the first of June, see your newly improved Calf Mower work, and, in our judgment, consider it one of the greatest improvements that has ever come under our observation, of the kind, and we cheerfully recommend it to the farming community, as it is purely a California invention, and contains many decided and valuable improvements.

Yours, truly,
G. W. HAMMETT, A. RALDWIN,
M. CROCKER, CHARLES MCARRON,
D. R. MEACHAM.

June 12th, 1860.

MR. STANDISH—Sir: Your Mower was tried in my cloven meadow yesterday evening; it was rank thick grass and very much lodged. It performed well, as well as any machine could do. I saw it cutting oats in Mr. Harnet's field, and I am pleased with its performance. The calf wheel power over the cog wheel for driving a reaper knife must have a decided preference with farmers, on the score of economy, if for no other reason. There is no wear compared to the cog wheel power, which gives out and becomes useless in two years or seasons. The calf wheel will be as good after twenty years wear. I have no doubt of its being the right principle of driving the reaper knife, and when introduced into use will be preferred to the present cog wheel plan. It saves all the wear and tear of cogging-bearings and boxes, and if the plan is carried out and brought into use, it will save thousands of dollars to the farmers in buying reapers every two years.

Yours, with much esteem,

ELAM BROWN.

PACIFIC, June 23, 1860.

MR. STANDISH—Sir: This is to certify that I have operated one of your new machines, and find it to be, in my opinion, one of the best machines for mowing that I have seen work in this State. I also think that the draft is easier than a cog wheel machine, and also that it will not clog in the clover, or eat any grass.

Witness: Washington A. Wilson, W. T. Hendrick.

LAFAYETTE, June 27th, 1860.

MR. STANDISH—Sir: I saw your mower at work in down clover and oats very heavy growth; it performed better than any mower I have ever seen. Its simplicity, durability and lightness of draft, it certainly has not its equal.

Respectfully, yours,
WARREN BROWN.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our hitherto extensive establishment, we can confidently announce to the public that we now have

The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp-mills and Dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Mining Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Muley, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at McTeal's mill in this city.

Knox's Amalgamators, with the latest improvements; Howland & Hanson's Amalgamator; Goddard's Tab, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best English Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Saut Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Linn's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Steamboat work promptly attended to.

Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before?" It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with despatch.

ADOPTED AND NOW USED BY

Eastern Shore Gold and Silver Company,
Barbora Mill Company,
Ophir Mining Company,
Union Reduction Company,
Ogden & Wilson.

Washoe.

San Francisco.

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.

2d. Having two driving wheels, if one slips the other does the work.

3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.

4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.

5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.

6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.

7th. The cutter-bar being hinged to the machine, can be packed up without removing bolt or screw.

8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two wheeled car.

9th. It is mostly of iron, simple in construction, and a boy can manage it easily.

10th. It has no side draft.

11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchasing.

KNAPP, BURRELL & CO.,

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC AMERICAN Patent Agency of Messrs. Mun & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a rejection, and for appealing it to the Commissioner, no additional fee will be required. In cases of Interference or In an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATK COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of unimpaired integrity. As such I commend him to the inventors of the United States.

To give the readers of the MINING AND SCIENTIFIC PRESS some idea of the magnitude of these metallurgical works—the most thorough and extensive on the Pacific Coast—we furnish them in our present issue with an illustrated description of the various departments, and the manner of operating in them. The first processes are exhibited in Fig. 1, where the ore, after it has been crushed by stampers, is placed in Chile mills, and still further reduced in the dry state. The powdered ore is then conveyed up-stairs to the room shown in Fig. 2, where it is passed through a series of arastras—after which it is taken out and placed in vats. The quartz, or other rock, in these vats being frequently stirred, much of the amalgam having a greater specific gravity, falls to the bottom, and is collected after the superincumbent mass of pulverised ore has been removed. The poorer crushed rock is then sent down-stairs again to room No. 1, where it is run through ingeniously constructed sluices and riffle boxes, where the residue of the gold (if that be the metal contained in the ore) is amalgamated. The amalgam is then passed into an adjoining room, Fig. 3, which is the Assaying Department. This room is full of furnaces of various kinds, crucibles, cupels, acids, and all the other concomitants of a well appointed Metallurgical Laboratory. Here the amalgam is strained and retorted, the metal then being smelted, refined and run into bars. The large furnace seen to the right of Fig. 1, is called a reverberatory furnace—where sulphurets are roasted, after being separated by the most approved process from the "gangue." Those of our readers who feel disposed to visit the works, will be amply rewarded for their trouble by the information they will thus obtain. They were erected on European plans, under the direction of Mr. Fouque, an able Metallurgist. Both wet and dry processes are used, and the works are capable of reducing three tons of ore per day, going through all the various manipulations of parting, assaying, smelting and refining. Thus the metal contained in twenty tons of ore—whatever it may be—can be returned in fine ingots to the owner in one week. Ore has been reduced here from the Dana Lead, the Gold & Curry, Lucerne, Bailey and other mines in California and Nevada Territory, besides ores from

PACIFIC METALLURGICAL WORKS.

No. 1.

Mexico, Arizona, and other portions of Western North America. In testing ores it is advisable to send to the works at least one ton, so that a fair approximation of its general richness may be arrived at. When necessary, these Metallurgical Works can reduce double the quantity of ore above spoken of, by doubling the power, which they can do without the addition of new machinery. The proprietors are wealthy citizens of San Francisco. The agents are Messrs. Bradshaw & Co., No. 300 Sansome street, who transact all the preliminary business. The works are situated on the corner of Francisco and Mason streets, in the three-story building formerly known as "Meigg's Mill." Mr. G. F. Fouque is the Superintendent. Any one desirous of procuring specifications, patterns, models, or complete machinery for reducing ore, as shown in Figs. 1, 2, and 3, can do so by calling at the office of the Pacific Metallurgical Works. It is well to remember that at these works, sulphurets are successfully treated. The Company will purchase or smelt them at the option of parties owning the same.

The same too in regard to Jewellers, and Assayer's sweepings.

With metallurgical works so complete as these, it is downright folly to send ore to Europe for reduction. Nothing more can be done there than here—and by shipping it to Europe the additional cost of transportation, cost of insurance, and great loss of time are incurred. Ore that will not pay to send to Europe, will furnish a profit if reduced at the Pacific Metallurgical Works.

PIRATICAL INVENTORS.—In the *Scientific American* of June 15th, 1861, is a description of a new packing for shot or wads for rifle cannon, said to be invented by Mr. E. D. Williams, of Philadelphia. The *Tuolumne Courier*, however says that the only difference between the one described and one invented by Col. Thos. R. Stoddart, now of Sonora, in that county, is that Mr. Williams uses zinc in the place of the copper used by Stoddart. Stoddart was formerly from Philadelphia, and has sent his invention on to Congress as a present to the nation, amongst other improvements in ordnance. The difference is so slight, anyhow, between the packing of Williams and that of Stoddart, that it cannot be patented.

NORTHERN DISTRICT AGRICULTURAL FAIR.—In reference to the preparations made by the Northern District Agricultural Society for their fair, the *Marysville Democrat* says:

The Committee very judiciously, as we think, fixed the time a week before that of the State Fair, so that exhibitors can proceed to Sacramento, if they desire, at the close of our exhibition. It is conceded that the counties north of Sacramento have by far the finest stock in the State, and we hope that the stock raisers will, as heretofore, make it a point to exhibit their animals, and thereby create a generous rivalry and encourage the breeding of fine stock for which our State is becoming so justly famous. The oration will be delivered by Rev. T. Starr King.

LATE FROSTS.—In the valley of Trinity county, the fruit crop was entirely destroyed by late frosts, some of which occurred not six weeks ago.

POPULOUS.—The population of Utah is estimated at 50,000.

PURE NATIVE SONOMA WINES.

RED, WHITE AND SPARKLING.

From Lachryma Montis Vineyard.

MANY FAMILIES AND OTHERS BEING DESIROUS OF PROCURING MY Wines, and having now a large quantity accumulated of the vintage of the last five years, I have determined on introducing them into the markets, for which purpose I have appointed A. S. Lowndes & Co. my sole agents, of whom the wines may be obtained in their pure state, as they come from my vaults in Sonoma.
At the Depot, 617 Montgomery street, from this time we shall have in store a constant supply of all classes of the Lachryma Montis Wines, and parties purchasing from us may rely on obtaining the pure offspring of the grape. First Premiums and Diplomas have been awarded to Gen. Vallejo for specimens of his Wines, exhibited at the various Fairs held in the different parts of the State during the past four years, and having now attained some age, are for the first time brought into market. As dinner wines, and a general healthy beverage for this climate, the Lachryma Montis Wines cannot be surpassed. For sale in quantities to suit by
A. S. LOWNDES & CO., Agents,
617 Montgomery street, opposite Montgomery Block, San Francisco.

SAN FRANCISCO, SATURDAY, AUGUST 10, 1861.

NO 20.

GOLD CANON MILL, AND THE WAKELY PROCESS.—Messrs. Kelsey & Co., of Nevada territory, says the *Washoe Times*, are progressing finely in the erection of an excellent quartz mill (of the above name) situated at the junction of Gold Canon and American Ravine; and if any one in the country has water in abundance they have. They have just got their two story main building, twenty by fifty up, and will add to it a large area of one story buildings; one side to cover boiler, another to cover batteries, and the other to cover amalgamators. They have a tubular boiler, fourteen feet long and forty four inches in diameter, with forty flues. It is the best boiler we have seen in the territory, and is finely set in brick work. The engine is forty-horse power, and a master piece of workmanship. They will have at present one battery of five stamps, two arastras, and ten Wakely amalgamators, although they do not confine themselves to the Wakely process, as they intend to adapt the process to the rock they are working. They have power for much more machinery, and intend to put up batteries, pans, etc., in a short time to the full capacity of their engine. The mortar which they use is divided into five compartments, so that each stamp shall do its full duty. The crushed ore passes through steel grates and fine sieves at the sides, and by a simple and ingenious contrivance, the finest ore is conveyed to the grinders and the coarse returned to the battery. They will work the ore dry; are old and experienced quartz workers, and will work for both gold and silver.

A NEW INVENTION.—The editor of the *Marysville Appeal* has been shown a very curious invention, which, he says, is designed to make bees more regular in their habits. The practice of these insects is, as every bee-keeper knows, to crowd their combs about in irregular ways, wasting the room in the hive, and also losing much time in preparing for the first row of cells. This invention is a thin plate of wax which is by an ingenious process indented with the six square foundations of the cell, having the exact size and shape necessary to be used by the bee in commencing the cells. This foundation being fastened to the desired place in the hive, will be used by the workers, time saved, and the inconvenient placing of the comb in the hive obviated. The inventor is Mr. Baxter, of Napa, and he claims that it has been very successful and operates well whenever tried.

A THRIVING TOWN.—The *Telegraph* says that it is a fact, remarked by all close observers of trade and traffic, that there is more business, of a general character, transacted in Folsom than in any other town of the interior of like size. The prospect of speedy and extensive manufacturing facilities is attracting much attention, and we may look forward with cheerful hopefulness to the rapidly approaching period when Folsom will be enveloped in wreathy clouds of black smoke from and cheered by the industrious and incessant noises of varied manufacturing machinery, driven by the power of steam and the natural waters of the American river which courses its rapid way down the front of our beautiful and growing little city.

LUSUS NATURÆ.—The *Coloma Times* has been shown by Mr. H. B. Pierce a remarkable freak of nature—a bunch of cats—four of them joined inseparably by the cord umbilicus, yet otherwise perfect in form, and which would have undoubtedly lived unto a ripe old age, had it not been that Mrs. P., not viewing the mass with the eye of a connoisseur or that of a philosopher, plunged them into a ditch which passes near her door. Mr. P. on learning the circumstances followed down the ditch and succeeded in overhauling them, but too late to save their lives. All that now remains of them is to be seen in a druggist's store in Coloma.

BIG SNAKE.—At Table Mountain, Calaveras county, lately, a rattle snake was killed, which was five feet long, eight inches in circumference and had twenty-six rattles.

The Works of the Spanish Company at Washoe.

The editor of the *Enterprise* recently paid a visit to the works of the Spanish company in Nevada Territory and says:

"We were surprised to notice the improvements recently made, and the perfect system which pervades the entire establishment. Every department of their reduction works is systematized, and everything moves like clock work.

The mill is now crushing and reducing eleven and one-half tons of ore per day. Sixteen stamps are used for crushing. After the rock is crushed it is taken to the furnaces and roasted. Two new furnaces have been erected, and they can now roast their rock as fast as crushed. Two processes are used for amalgamating—the Freyberg and the Thayer—both of which work admirably. The Thayer process is worked by Howland's fine pans, of which they use twenty, and is considered a perfect success. Twenty revolving barrels are used in the Freyberg process. This method has long been known as one of the best ever discovered for extracting silver. Different qualities of rock are worked by the different methods—the richer quality, yielding from \$400 to \$800 per ton, being worked by the pans, and the poorer quality, yielding from \$125 to \$200 per ton, being worked in the barrels. Every twenty-four hours the assayer tests the result of the day's labor, and knows the quality and yield of the rock crushed. The mill is run night and day, and has thirty-six men constantly employed, in addition to which there are ten or twelve men employed in the mine. Quite a number of other hands are indirectly engaged in getting wood, salt, and other material for the works.

The mill, which is under the able superintendence of Mr. Theodore Winters, is yielding equal to the most sanguine expectations of its owners. With the improvements recently made it is anticipated that during the month of August the mill will yield from \$60,000 to \$70,000. The monthly expenses of the company are \$15,000. They have their own assay and smelting works, and now run their own bars.

The officers at the works are: Theodore Winters, General Superintendent; Mr. Tompkins, General Foreman; Mr. Beslit, Superintendent of the Freyberg process; Mr. Beckworth, Foreman of the mine.

GRASSHOPPERS IN SONOMA COUNTY.—Throughout Two Rock and Big Valleys, the grasshoppers have materially injured many fields of small grain, especially oats. In Two Rock Valley, one field of 50 acres was rendered entirely worthless. In Big Valley, one farmer had a large field of oats cut, but before binding, the pestilence swept through the field and decapitated nearly every straw. We would suggest the idea of sending for the Digger trees to wage war upon the common enemy. The grasshoppers are fat and would make good ch muck, and so abundant that the "poor Indian" would kill himself by over eating. The two plagues would thus be removed.—*Petaluma Journal*.

PHOTOGRAPHING A SPIRIT.—The editor of the *Revue Spirite*, published in Paris, relates the following: "A well known photographer on the Boulevard des Italiens, was sent for by a widower, the master of a chateau, a few miles from Paris, in order to take a likeness of the front of the chateau, with its master on the terrace, and his children grouped on the flight of steps below. When the photograph was taken the artist was astonished at finding in his picture a female figure standing beside the widower, the latter being still more astonished, on examining this extra figure, to recognize in it the perfect portrait of his deceased wife."

TRINITY CAVE.—The *Douglas City Gazette* says, that a party are going to explore a cave in that vicinity, the existence of which has been known for some time.

VARIATIONS OF THE NEEDLE IN CALIFORNIA.—At a recent meeting of the Academy of Natural Sciences, held in this city, Col. Leander Ransom read an interesting paper upon the variations of the magnetic needle in this State. He stated that the variation in the extreme South of the State is much less than at the extreme North, the former giving 12° 40', whilst the latter gives eighteen degrees. The local attraction, he said, is much stronger in some parts of the State, than in others; as for instance: at Sonora it varies from fourteen degrees to eighteen degrees, at Lassen's Buttes from fourteen degrees to 17° 30', and at Shasta from fourteen degrees to eighteen degrees. At Humboldt, Mt. Diablo, and San Bernardino, there is but little local attraction. He called attention to the fact that hitherto few observations had been made here on the diurnal variation of the needle, and that the observations of the Coast Survey showed an average easterly deflection of one minute annually while his observations made it more than four minutes.

A NEW TURNPIKE ROAD.—The *Sonora Age* says: A step has been taken in the right direction, and a company organized for the purpose of building a turnpike road from this place to Mono, Esmeralda, and the regions east of the mountains. If the citizens of Tuolumne, Stanislaus and San Joaquin will act with energy and construct this road, it will prove the greatest and most beneficial enterprise. The route is the shortest, and can be made the best across the mountains, and the completion of the road would not only bring all the local trade from the silver region to our doors, but would turn a large portion of the emigration from the east to the southern portion of the State, who have now to go away round by Placerville, at least one hundred miles out of their way in order to reach their destination.

VIRGINIA FLOODED.—At Virginia, says the *Enterprise*, the California, Wm. Penn, and Vermillion Mining Companies have struck large streams of water in their tunnels. Our streets in many places are so much inundated that Street Commissioner, Killip, has had men for several days, turning the water into the proper channels. There are few who resided here a year ago, who did not predict that we would suffer for water, as the town increased in size. Instead of that we now have it in profusion, and in quite a number of saloons fountains are playing, and most of the stores have their hose attachments for the purpose of watering their fronts.

DISCOVERIES.—A correspondent travelling in Plumas county says that recently crossing the mountains from Jamison creek he found a pond filled with floating ice, on which multitudes of frogs sat screeching with original vigor. He threw stones at them, but they only screeched the louder—"they were so unacquainted with man!" The place was one of uncommon beauty and grandeur, inasmuch that the traveler concluded to camp there for the night. But on going down to the water's edge he discovered numerous and alarmingly large bear tracks; whereupon he made smaller tracks him off.

THE GREAT "UNION" GUN.—The large rifle cannon, "Union," now at Fortress Monroe, is to be mounted on the deck of the Minnesota. It carries three hundred and fifty pound shot, and is supposed to be the most destructive weapon ever mounted. Neither its range or initial velocity is as great as some other guns, yet the weight of the shot will be such as to sink any ship, and ultimately destroy almost any fortification. The projectiles for the gun have not yet arrived.

A Word to California Farmers.

We observe that the millers of California are bent upon making the farmers furnish them clean instead of dirty wheat. The millers of Yuba county, according to the *Appeal*, have declared that they will not encourage this nuisance any longer, and producers may be sure that wheat which was the refuse of their threshing ground and a heterogeneous admixture of unmerchantable rubbish in it, will find its proper price, and be classed with "rejected" or "inferior," when, with due care, it might command the highest current rates. There is no excuse, with the present present prices, for such a shiftless policy as has heretofore been pursued by our farmers, and it is to be hoped that this year's crop will be able to redeem the reputation of California wheat in foreign ports.

The *Napa Reporter* says, in connexion with this subject: We see by some of our late exchanges, that the large quantities of barley, oats, etc., present in the wheat shipped from California, has tended materially to depreciate it in value; and our farmers, and all interested in the grain business, should pay particular attention to this fact if they want a market to ship their surplus grain to. Practical millers have always felt the want of complete and perfect machinery for cleaning grain, or rather separating not merely wheat from the chaff and foul matter, but the wheat from the oats and other grain, which is often mixed in growing; and ingenious mechanics have experimented a great deal in trying to produce the machinery so much desired. Hitherto, but partial success has attended their efforts. It is with great pleasure then, that we call the attention of our farmers, millers, and the interior press, to the fact, that this want can now be supplied by the purchase of Turner's Improved Combined Smutter and Grain Separator—the most perfect machine of the kind in the world. It has no equal in scouring, separating, and otherwise cleansing grain from smut, chaff, grown wheat and other impurities. As wheat always contains, when brought to market, more or less smut, dust, chaff, and other foul stuff, and in passing it through a smut mill, if the grain be the least damp, the smut, dust, etc., are liable to adhere, it is absolutely necessary that the smut Bulls should be taken out unbroken, before the grain enters the Smutter, and the dust pass out as soon as scoured from the berry, that the grain may not wallow in it.

In this machine, the Smutter is composed of from three to seven sets of horizontal scouring plates between which the grain passes. The lower plater or runner of each set is provided with benters, which throw the grain against the upper plater, which is stationary and also provided with beaters, thereby causing the grain to act against both plates with equal certainty and uniformity. A rough or sharp surface is not depended on for scouring, but it is claimed that what the machine will do the first month it will continue to do for years in the same manner.

The grain enters at the top, where it first falls upon a zinc or sheet iron riddle, through which the grain passes, taking off sticks, stones, etc., over it. The grain then falls upon the first inclined plane, then into the first blast from the fan at the bottom of the machine, which takes out most or all of the Smut Bulls, Oats, Chaff, and other light impurities, before the grain enters the Smutter. This all millers know to be of the greatest importance, particularly if the grain be damp. The grain then passes out of the blast of the Separator into the Smutter, the dust passing through the perforated case opposite each set of plates, and drawn up into the top fan and carried out of the Mill if desired—the grain passing through the Smutter, discharging the heavy screenings at the angle in the enlarged spout.

The Machine is well ventilated, by a blast from the lower fan into the center of the Machine, by which there is no possibility of its ever becoming filled up or clogged with dust.

This Machine makes five distinct separations: 1st. The heads, sticks, etc., over the Riddle. 2d. Screening from the first blast, (which are the lightest,) and before the grain enters the Smutter. 3d. The dust. 4th. Screenings from the second blast of the Separator, after the Smutter. These last are free from dust, and in good condition to grind for feed or otherwise. 5th. The clean grain, at the bottom of the Machine.

Only one driving belt is required, and but two in all—and can be as easily attached as any upright Smutter. Rolling screens may be dispensed with, except for cockle.

The step of the Smutter shaft is the only place from whence arises any danger from fire, by the friction of the Smut Mills; hence the absolute necessity of having the step always in sight, and convenient to be oiled, with no liability to run dry, from its situation being unapproachable without taking the Machine to pieces. All Millers, and all vigilant and competent Insurance Agents, should thoroughly examine all Smut Mills and report to their principals,—whether the step of the Machine can be examined daily,—its facility for oiling,—its contiguity to wood,—the velocity of the Machine, and its liability to clog with dirt. As sad mistakes have been made in this important matter, all parties interested are particularly requested to examine this Machine. Aside from any danger from fire, the convenience of the miller should be consulted. He is desirous of knowing and should know to a certainty, that the step is oiled and in good order, and this he should be able to ascertain with as little trouble as possible, and as often as desired. In this machine the step is always in sight, and can at all times be examined and oiled as easily as any ordinary journal. It holds nearly half a pint of oil, and can at any time be drawn off and replenished. No

grit or dirt can remain in the step, but will be thrown off into a lower cavity. From these considerations the Machine is regarded fire proof.

Millers and farmers desiring to obtain this valuable machine can do so by applying to J. SILVERSMITH, proprietor MINING AND SCIENTIFIC PRESS, No. 20 and 21 Government House, San Francisco—he being the sole agent for California. He would also be happy to confer with parties desirous of purchasing the right to sell the "Combined Smutter and Grain Separator," in any county of the State.

TO INVENTORS AND DISCOVERERS, MECHANICS AND MACHINISTS:

The undersigned, having had great Experience and Facilities for completing and carrying out Inventions and Improvements upon all kinds of Machinery and Implements, also preparing the requisite Drawings, Models, Plans and Specifications, and is otherwise conversant with all principles in Mechanics of modern practice, and could prove, therefore, of invaluable aid to Inventors and Discoverers. Those contemplating bringing their inventions in a proper shape before the U. S. Patent Commission are particularly requested to consult the subscriber.

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved

AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz.

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.
2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.
3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required. The part most exposed to wear is made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,

THE CULTURE OF RICE.

Suggestions have frequently been ventured by contemporaries, that the Chinese population of this State be employed in the culture of rice—for which they are so eminently adapted—but we have not yet seen any practical hints given by them, so that Californians with sufficient capital at command, can immediately set to work and profit by the information. In a recent article we recommended that the Chinese in this State be employed in the cultivation of flax (which, in the coarser fabrics is supplanting cotton) upon our tule land. These same tule lands can also with profit be sown with rice, and if our advice in this matter be followed, California will ere long be as renowned for her rice and flax plantations, as she now is for her mines of gold.

In the first place it is necessary to enclose the tule land with an embankment, with a ditch leading into it and a tailrace from it. The ground should be so selected that no more than one half inches of water cover the soft mud—or less. The plantation must then be weeded thoroughly. The simplest way of proceeding after this is to sow the rice-seed broadcast, care being taken not to sow it too thickly. Previous to sowing, however, it is best to throw the seed into water, rejecting what floats and reserving that which sinks for use. If this precaution be not taken, when the rice is cast upon the flooded land, the light grains will float together, and when sufficiently soaked will fall upon the mud that has already received its proper share of good grain. When the top of the rice plant becomes visible above the water, the Chinese laborers may be set to work thinning out, and pulling up weeds, if any there be. This will take but a short time.

As the plant grows upwards it is necessary to let on more water. When the rice ripens, the water must be drawn off by the tailrace, and the ground left as dry as possible. It must then be reaped and threshed. Then it is ready for sacking and a market.

This method is the easiest that we know of, and after the embankment is constructed, will cost only about six dollars per acre, which if all goes right, should yield about four thousand pounds of grain. This, at five and a half cents per pound, the latest San Francisco market quotation for No. 1, would give \$220!

Wind is a great drawback to rice cultivators, and it is necessary to shield the plantation as much as possible with trees, and by keeping the plant under water. From this cause the average crop is generally between two and three thousand pounds per acre. Supposing then that a California rice plantation produced only two thousand pounds per acre, and the expense amounted to as much as twenty dollars, there would still remain the princely profit of ninety dollars on every acre planted.

In the Sandwich Islands, attention is being attracted to this branch of culture with great success, but thus far all attempts have been experimental. For instance, one of the Honolulu papers states that "on the 1st of March, Dr. Ford planted four pounds of Carolina rice seed in a tarpach containing little less than a quarter of an acre. One Chinaman was two days in preparing and planting the seed. When of sufficient growth to transplant, the same man transplanted it in a quarter of a day. In four months and three days from the date of transplanting, the crop was gathered and yielded 1,163 pounds. The estimated expense of labor, rent of land, etc., is about \$16 50. At a fair valuation, domestic rice is worth six cents per pound, which would make the above yield worth \$69 78." There was a profit of \$53 38 from a quarter of an acre of land, in four months after planting—only one man being employed for two days and a half. The rent was undoubtedly the largest item of expense. Now, why cannot the same thing, only on a much more extensive scale, be done in California. It can

THE SUNDAY LAWS IN THE MINES.

In San Francisco, considerable antagonistic feeling has been aroused since the New Sunday Law has gone into operation. Bar keepers and barbers are particularly incensed, most of them affirm that at the next election they will vote for no man, be he Republican, Democrat, or "Seseshocrat," unless he is an anti-Sunday Law man. But the Sunday Law excitement here is nothing to what it is in the mines. The interior papers all contain articles upon the subject, and it is pretty generally conceded that if the Supreme Court does not set the law aside as unconstitutional (which we think will not be done), it will be evaded—and it is thought by competent lawyers that there are plenty of escape loop-holes in it.

Among the various remarks of our contemporaries upon the matter, the following we think quite pertinent: It must be apparent to every one, that the provisions of such an act will meet with greater resistance in mining towns than elsewhere. In large cities it is no inconvenience for all classes and conditions of people to lay in their supplies on Saturday nights. The laboring man and mechanic receive their week's wages at that time, and have the market at hand to furnish every article demanded by their wants. Among the miners it is different. Even in those cases where the money is abundant, time is a matter of great importance. The miner is employed in his claims to a late hour on Saturday evening—and is often as far removed as two, three and four miles from the place whence his supplies are derived. Sunday is his day of leisure, and it is then that he makes his purchases for the week that is to ensue. His compliance with the act, will be of compulsion, and compulsion only. The law, we think, will be found almost inoperative in mining regions. If any class of business men wish to see it enforced for their own special protection, they will be compelled to go into the courts to contest the matter; which may bring them the required relief.

Bailey and His Silver Ore.

It appears that Mr. Bailey, the reputed discoverer of a rich lode of argentiferous ore, somewhere within one hundred miles of Los Angeles, really left San Francisco by the steamer Salinas, on the 17th July, for Watsonville, from whence he went on horseback to his mine—or to some other place. Holders of stock in the mining company, of which he is President, continue to have all faith in him and his silver mine—but since reading a report of the proceedings of the California Academy of Natural Sciences, at a meeting held a few evenings ago in this city, we begin to believe with the majority of our citizens that those who invested in "Bailey stock" have been badly "sold." At that meeting, according to the report published in the columns of a contemporary: "William P. Blake read a communication on the famous Bailey 'Silver Ore,' giving the results of some examinations he had made, which tended to confirm his suspicions of the artificial origin of the compound. He exhibited a specimen of the ore, which was described as having the lustre and appearance of metallic antimony, and as crystallizing in cubes, in the cavities, like the crystals of bismuth. It was found to contain antimony, lead, silver, copper, and a little sulphur. These substances are found in the well known ore Prieslebenite, or the antimonial sulphuret of silver, but in the Bailey ore, the proportions of these substances appear to be very different from those in Prieslebenite, which contains twenty-two per cent. of silver, while the Bailey has less than 11 per cent., and has also less sulphur. Specific gravity of the Bailey ore is 7.4; that of Prieslebenite is 6.4; the crystallization is also different. The only other antimonial silver ore (Diserasite) contains seventy-six per cent. of silver and has a specific gravity of 9.4 to 9.8. The Bailey compound was therefore pronounced either a new and undescribed species, or an artificial compound. The reasons for suspecting it to be an artificial mixture were then given. The most suspicious circumstance was the condition of the specimens of silver bullion which were exhibited with the ore. This silver had evidently been melted and allowed to run out into loose dirt and sand. When, at the first, attention was called to this the explorers said in explanation that a crater had opened directly in the line of the Bailey lode and the fire had smelted the ore. This new volcanic process Mr. Blake admitted as possible, but its probability was extremely doubtful, moreover, the bullion would hardly be allowed to run out upon the surface of the ground, at as low a temperature as the specimens evidently had been. The next suspicious circumstance was the finding of a piece of charcoal in the midst of the mass of the so called ore. Finally, the fact that a metallic mass of that kind was different from any known ore, was presumptive evidence of its being an alloy, for it is now hard to find a silver ore that has not already been well known and fully described by mineralogists. Mr. Blake observed that the question of its origin could be definitely settled by a careful quantitative analysis, showing the proportions of the various ingredients.

The Future of Mountain Towns.

What is to be the future of our mountain towns? Who does not ask the question, yet half dread to hear it answered? At this moment there are hundreds of business men speculating on it; and hundreds out of business of course, who proclaim they are "gone in." Men stand at the door of their stores, look up and down the street, yawn, stretch themselves, and retire to mourn over dull times. Those of what the phenologist would term the nervous bilious temperament, walk hastily up and down their places of business, or work desperately for a few minutes, and then subside into chronic dullness, with their chairs tilted back, their feet against the stovepipe, while they read the daily papers for the twentieth time. Times are dull everywhere; business is stagnated, and people want to know the reason of it.

"Business is overdone, of course; that must be the answer. We all know that, so you may as well save us the repetition of such unpleasant information." Softly, gentlemen. There are two ways to read old proverbs, sage and indisputable as the conclusions invariably appear: and in like manner accepted facts, when exhibited in another light, vary in interpretation, like manuscript written in invisible ink when held to the fire.

In the first place business in the mountains is centralizing—concentrating into central locations. There can be no question of that; and for this there are two reasons: the exhaustion of the mines in certain districts, and the increased facilities for the delivery of merchandise. Thus, towns having a purely local dependence, must inevitably decline with the decline of the mines of that immediate locality. There are towns for example, entirely dependent upon river mining; perhaps of a very limited portion of the river at that—the district between two canons, possibly. The mining in these locations is now on a very extensive scale. As I heard a miner lately remark, "they employ fewer hands and more head work." One company will occasionally claim an entire bar; and though they take out a fortune, it is no benefit to the trader, who naturally enough sighs for the good old times. Of course, then, as there are fewer miners, there must be less business; as these localities have been worked over half a dozen times, and the discovery of anything new is highly improbable, the sooner the citizens of such places "secede" the better. The companies that remain are doing well, and will in all probability continue to do well for years to come; but they can buy their goods at the large towns, six, eight or ten miles away. They do not need even to leave their claims—they can send an order and have their goods delivered free of additional charge. What is the use then of traders lingering about these desolated places, when there are plenty of rising towns and undeveloped districts coveting their capital and energy.

But the cities and towns that possess a central location are also dull. Their merchants complain of dull times as loudly as anybody. How are you going to get over that? Well, in the first place, "dull times" is a chronic disorder among merchants, like fever and ague, asthma, consumption, and other complaints of a similar nature. Once become an invalid, and you will always remain one; if not sick from a direct attack, you suffer from a sympathetic one—and there is only one cure in either case, "a change of air."—*Mountaineer*.

PHILOSOPHY OF RAIN.—To understand the philosophy of this beautiful and often sublime phenomena, so often witnessed since the creation, and essential to the very existence of animals, a few facts derived from observations and a long train of experiments must be observed: Were the atmosphere everywhere and at all times at a uniform temperature, we should never have rain or hail, or snow. The water absorbed by its evaporation from the sea and the earth's surface would descend in an imperceptible vapor, or cease to be absorbed by the air when once fully saturated. The absorbing power of the atmosphere, and consequently its capability to retain humidity, is proportionally greater in cold than in warm weather. The air near the surface of the earth is warmer than in the region of the clouds. The higher we ascend from the earth the cooler do we find the atmosphere. Hence the perpetual snow on very high mountains in the hottest climates. Now, when from continual evaporation the air is highly saturated with vapor, though it be invisible and the sky cloudless, if its temperature be suddenly reduced by cold currents of air rushing from a higher to a lower latitude, its capacity to retain moisture is diminished, clouds are formed, and the result is rain. Air condenses as it cools, and like a sponge filled with water and compressed, pours out the water which its diminished capacity cannot contain.

ARIZONA.—An occasional correspondent of the *Bulletin* writes from Tucson as follows: "Well, this country is going to the devil with railroad speed. Secessionists on one side and Apaches on the other, will bring us speedily to the issue, and the issue will be absence or death. The troops are now withdrawn and the Indians will have it all their own way. But it is possible that Government will allow this territory, acquired at an expenditure of so many millions, and whose resources in gold, silver, copper, lead and other minerals are so great, to say nothing of the agricultural advantages, to become uninhabitable to the white man by reason of hostile savages, and make no effort to save it?"

CALIFORNIA.

Tuolumne county.—The following paragraphs are taken from the Columbia review. The miners of this section are, as a general thing, doing excellently well. There is abundance of water, and every man is employed. It is almost impossible to hire a man hereabouts. Although we have had but few rich strikes to chronicle recently, the miners are nevertheless doing well, but owing to the difficulties at the Mutt, which has caused a reduction in the price of gold to the miners, but a comparatively small quantity is bought by the bankers. The following are the names of the principal mines in the county: The Mutt, near Mr. Sandborn, at Indian Bar, on the Tuolumne river, which with

of salt every week supply the demand of the mills at this place. They had ready sale for it at five cents per pound. . . . -Adolph Sutro, of San Francisco, is building a steam mine tunnel near Berkeley, Nevada. He commenced a tunnel in February last, and now have in it 1,000 feet, have made an arrangement with the White & Murphy Co., and the two companies intend to run their tunnel in partnership. It is expected that both companies will strike their leads within about 100 feet where they are working at present. The prospect speaks of a number of men returning from the Humboldt Region, laden with rich species of minerals. They talked of great wealth abounding in that place. The Red Bluff Beacon says: Messrs. Gage, Jackson and others who returned from Humboldt City, by the way of Honey Lake and over the Snake Range, report that they have discovered gold. They have taken up or purchased claims in the mines, and think that the Humboldt mines are the richest ever discovered west of the Rocky Mountains. . . . From the Territorial Enterprise and Washoe Times we glean the following news relative to the mining industry in Nevada: "The centre of all activity in the Territory is now in the centre of a large mining region, and does an immense business in quartz. An assay office here would prove an exceedingly remunerative business to its proprietors, and retain in the place much of the money that is now passing elsewhere." "The gold ore is going for forty cents a weight. The gold found in the mill, is making from \$12 to 20 to the hand each day. The gold found in the tail race is quality."

where, some call out extravagantly, when they had water to work them.

From our knowledge of the mines of Southern Oregon, any one without the help of a combination of men or capital, can obtain better returns for his labor here than in any section of country where the wealth for capitalists it offers great inducements in the construction of ditches for the development of our quartz loaves, some of which, aside from the Applegate hole of Fowler & Co., which has always paid rich, are prospecting well. Months and even years of perseverance and economy are now required to accumulate what was sometimes acquired in a week in mining in early times. One remove frequently consumes the proceeds of a year's successful mining. While we would be glad to hear of good mines from one extent of the coast to the other, we would caution all who are thinking of making a change of location, that while they are making wages they had better stick to it, or even add something to their exertions in prospecting and developing the region, to their immediate neighborhood, especially where known, as this is, to be a good mining district, then follow the usual summer excitements—for experience proves that in nine cases of ten, all such experiments are time and expenses out.

Report says that the long talked of gold mines on Meeks' cut-off, found by the immigrants in 1845, have been re-discovered. The story goes that the mines are in the vicinity of the Three Sisters, six or eight days' travel east from Salem, Oregon, and are very rich.

By the press just in from the mines I learn that quite a number of miners leaving have been driven back from the South Fork. A large and well armed party was at once organized at Oro Fino and will at all hazards prosecute their desired object. Another party has been organized at Oro Fino, and will proceed direct to the Salmon river. It is well understood that prospecting the location of the mines is highly necessary for parties contemplating the purchase of either of the two localities—the South Fork or the Salmon river—to go well armed, and in every way well prepared to meet with a strong resistance. By the same express we have received the most cheering intelligence from the Oro Fino mines; and, in fact, the same may be said in regard to the entire locality in this region of the country. ----- A letter in the Yreka Journal, from Allany, Lun county, Oregon, written by L. Terry, who has just returned from the Mexican mines, reads: "I arrived here this morning (the 27th) with a party of 12 men, and 1000 lbs. of gold. The Mexicans gold mines are not as rich as the Goshute. There is about one claim to every twenty men, and I tell you a good many men will see the elephant before they will be able to get back. Some few claims are paying very well. But the mining region is not extensive; only two small creeks and Oro Fino swamp will pay in places. I expect there is some excitement at Yreka about these mines.----- Correspondents of California papers are paid for it, and they chronicle some very flattering reports about the mines. I have seen a number of articles of this kind. The same correspondents are making money out of the excitement, and the correspondents of papers in California are treated like birds on the steamer. Again I repeat the Nez Perces mines are a lumbar of the largest size.----- The editor of the Portland Times writes that there are about 5,000 persons at these mines, and about 100 arriving every day. A majority are prospecting. The weekly gold yield is not less than \$60,000. Coin is scarce. Dust sells for \$16 per ounce, but miners are not buying it. Gold is at a low price. Society is about the same, but in Yreka just at 424. Gambling and drinking saloons are the same. The women are unanimously and extensively paraded. Men have made us high as \$120 per day each, and of course immorality and extravagance are rife.

The Victoria Press of July 23rd, says: The Otter arrived last night, bringing forty passengers and thirty-six thousand dollars by express and private hands. . . . The snow had all disappeared from Cariboo, although the water was still high. The most extraordinary yields were being obtained from Antler Creek. Amoung a number of shallow holes which had been sunk with great success, out of a hole a few feet from the surface, \$2000 worth of gold was obtained. There were making rapid fortunes—one company had been averaging, when our informant left, twenty ounces a day to the hand. Numbers of miners were still waiting, however, on the water falling. Two fortunate miners came down on the Otter with forty pounds weight of gold each. Several miners also came down with a few ounces up to a pound each. The excitement here is at its height. The excitement was caused at packing from Oregon. . . . Extraordinary rich strikes which had been made in that region.

From a Panama paper we learn that the schooner Don Hermanos had arrived from Chiriqui, bringing some seventy pounds weight of golden images from the Guacas, or mounds, concerning which so much excitement prevailed a year or two since. It is said that vast riches of this description are buried in that and other provinces north and south of it. A movement is talked of having for its object an expedition to explore some of the Mexican lakes and also that of Nicaragua, in view of recovering treasure supposed to have been thrown into them by the Indians at the time of the Conquest.

Interesting Explorations.

By the politeness of a friend, remarks a contemporary, we have been put in possession of the proof sheets of some very interesting "Memoranda," prepared by David Forbes, Esq., for the use of the British Government. The memoranda are made up from notes of an extensive exploration of the country, and relate to the resources of the South American Republic of Bolivia. We are permitted to make liberal extracts therefrom. The area of the Republic is set down at 560,000 square miles, with a population of 2,526,000. The country is rich in gold, silver, copper, tin, bismuth, cobalt, &c.

As a field for mining enterprise it is thought to be second to none in the world. The renowned silver mines of Potosi, the copper deposits of Corocoro and the tin of Oruro are located in this country. Gold dust to the amount of \$1,000,000 is annually shipped to England, even from the imperfect system of mining now practiced there. The gold deposits are rich and extensive, and need only an energetic system of labor to render them exceedingly productive.

Copper to the value of 2,450,000, has recently been exported in one year from the district of Corocoro. A new and extensive copper field has recently been opened in Cobija, on the Pacific Coast, which is rapidly being developed, the ore being shipped to Swansea in England.

The tin mines are supposed to be the richest in the world. Nitrate of soda abounds in inexhaustible quantities.

The country is also exceedingly rich in vegetable productions. The vegetable, however, to which particular interest is attached in the memoranda before us, is that of cotton, an article in the cultivation of which at the present time the English people are paying the most particular attention. We quote from the document:

"Cotton, both of the white and nankeen variety, is indigenous, and from time immemorial has furnished the textile fabrics used by the inhabitants of this country. Before the Spanish conquests and for a long period after, cotton was grown largely along the Pacific coast of Bolivia and Peru, and even exported in some quantity. Since the Independence, however, there have been no shipments, and the cotton plantations can hardly be said to exist except in name. On the Atlantic side, however, and even amongst the scarcely subdued Indian tribes of the interior, it is everywhere grown to supply the inhabitants with clothing, and is produced in such abundance (for example in Cochabamba) that the director of an American company now establishing mills for cotton weaving, informs me that they do not find it necessary to pay any attention to the growth of the cotton, as the supply offered at present not only far exceeds any consumption they themselves can calculate on using, but might be increased indefinitely were a demand to be created by exportation; in quality, he further assures me that it is found to be fully equal to the best States' cotton. As the navigable branches of the Amazon intersect this cotton yielding district in all directions, great facilities are offered for water transport to Europe.

The greater portion of the export and import trade of Bolivia is in the hands of British mercantile houses on the coast, but of late United States' enterprise seems to threaten our supremacy. Their late representative, Mr. Dana, has published a report, in which he urges the North American merchants to extend their commercial relations in this country. The previously mentioned company are developing the cotton industry of Cochabamba; another company is in treaty to establish direct steam navigation down the Amazon to New York; several American gold companies are in successful operation in Yungas; some of the principal exports (quinine, &c.) are being gradually diverted into the American markets, and a New York house is at this moment negotiating a loan to the Bolivian Government with money which it is notorious is being raised in London, and which English capitalists apparently do not negotiate direct, from a natural disinclination to enter into transactions with a government at whose court we are not represented.

The existing government of Bolivia has pursued a much more liberal policy, and shown itself more favorable to foreign enterprise, than the governments which preceded it; a result probably due in great measure to the Republic having, for the first time since its establishment, broken through the rule of electing military Presidents, who are generally noted for the narrowness of their views.

MICE POWER.—A man in Scotland has trained a couple of mice to spin cotton very successfully. The work is so constructed that the common mouse is enabled to make untwisted to society for past offences, by twisting twine, and reeling from one hundred to one hundred and twenty-six threads a day. To complete this, the little equestrian has to run 10 1-2 miles. A half-penny worth of oatmeal at 1s 4d per week serves one of these treadwheel culprits for the long period of five weeks. In that time it makes 1100 threads per day. At this rate a mouse earns 7s 6d per annum. Take off 5d for food and 1s for machinery, there will rise 6s clear for every mouse per annum.

BACON BY THE FOOT.—The people of Washoe hear so much about mining claims, and their value "by the foot" that they become inclined to estimate all salable articles by lineal measurement. A teamster with a load of bacon, was hailed by a customer with the question—"What is this meat worth by the foot?"

PRINTING OFFICE REMOVAL.

THE COMMERCIAL BOOK AND JOB STEAM PRINTING ESTABLISHMENT

Has been removed to the New Office,
No. 517 Clay and 514 Commercial Streets.

Book Printing, Law Briefs, Catalogues, Business Cards, Hand-Bills, Circulars, Theatre Work, American Flags, Envelopes, Badges, Bills of Fare, Programmes, Posters, Legal Blanks.

We keep constantly on hand and for sale, an assortment of

NATIONAL FLAGS AND BADGES,

In beautiful and extensive variety. Sole manufacturer of the

NEW UNION ENVELOPE,

With original and Patriotic verses. Everybody should use it.

Our Office is complete and perfect in every respect,

And we shall endeavor, in the future, to merit a continuation of that patronage which we have heretofore so generously received.

VALENTINE & CO., PROPRIETORS.

Please call and give us a trial.

A. KOHLER,

NO. 178 WASHINGTON STREET, SAN FRANCISCO.

Forty Cases of Musical Instruments Just Received,

Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS.

Also, TAMBOURINES, BANJOS, FIFES, FLUTES, CLARION PICALONES, VIOLIN BOWS, BOW-HAIR, ROSIN BRIDGES, PEGS, TAIL PIECES, FINGER BOARDS, TUNING FORKS, SSS ROMAN STRINGS (four lengths and four thread), and

ALL KINDS OF MUSICAL INSTRUMENTS,

Fresh every two months from Italy.

All of these goods will be sold to the trade, as they are direct importations from the manufacturers of Europe, and imported in large quantities by A. Kohler. He will sell them THIRTY PER CENT. CHEAPER than any other house in California; therefore it would be the interest of all to call and examine before purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by the case. The wholesale department of this House is on Sansome street, occupying the whole block from Clay to Commercial street.

ST. GEORGE HOTEL,

Corner Fourth and J streets,

SACRAMENTO.

J. R. HARDENBERGH, } Proprietors
J. B. DAYTON.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Potosi, \$175 per share.
Central, \$625 per share.
Ophir, \$1000 per share.
Gould & Curry, \$225 per share.
Chollar, \$15 per share.
Lucerne, \$20 per foot.
St. Louis, \$4 per foot.
Mount Davidson, \$60 per share.
Mark Anthony, \$8 per foot.
Louise, \$18 per share.
Bradley, \$5 per foot.
Sacramento, \$10.
Shelton Co., \$3 per foot.
Josephine, Flowery, \$10.
West Branch, Flowery, \$7.
Harrison, Flowery, \$12.
Yellow Jacket, \$25.
Exchange, East Comstock, \$40.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$16.
Ohio and Buckeye Co. Argentine, \$12.
Chimney rock, \$15.
Durgen, \$10.
Rich Co., \$3.
Miller, \$12.
Augusta, \$6.
Spanish Co. Plymouth Ledge, \$6.
Chelsea, \$8.
Cauey Ledge, \$25.
King Charles, at Flowry, \$6.
Edgar Co., Great Western Ledge, Geleua, \$20.

Number of Shares to the Foot.

Central, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.
[Having completed all the requisite arrangements, we lay before our readers a reliable list of prices of mining stocks of Utah.]

NOTICE.—THE GENTLEMEN OF SAN FRANCISCO ARE RESPECTFULLY informed that their NEW BILLIARD SALOON, with EIGHT FIDELITY CLASS PHELAN'S TABLES, will be opened for business on SATURDAY, JUNE 6, 1861. The undersigned respectfully solicits the patronage of all BILLIARD PLAYERS, and hope by conducting their Saloon in an unusual manner, to merit their continuance and support.

D. L. LYNCH.
M. E. HUGHES.

WHEELER & WILSON'S

FAMILY SEWING MACHINES!

NOT ONLY

THE BEST FOR FINE SEWING,

BUT THE BEST FOR...

MANUFACTURING CLOTHING

AND...

OTHER HEAVY WORK.

SAN FRANCISCO, June 6, 1861.

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, Cassimere and Tweed Suits, etc., from materials made at the Mission Woolen Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them cannot be surpassed.

Various styles of Machines have been employed on the above materials but the Wheeler & Wilson is preferred.

DONALD McLENNAN,
Proprietor of the Mission Woolen Mills.

July 6

THE SUTTER SURVEY.—The United States District Court has given particular instructions to the Surveyor General relative to the location of the Sutter grant. Many who supposed they were beyond his lines are included by this order, and particularly those residing on the South bank of the American river, and back from it, in the vicinity of the Bloom grant; and those residing on the north bank of the American, between Norris' grant (which extends on the west to Harris and Pears' bridge) and the Sacramento; and also on the east bank of the Sacramento, from the American to Feather river. This tract on the north bank of the American and east of the Sacramento, is to include about 600 acres, and as the entire distance is about twenty-three miles by the curvature of the rivers, the strip of land along the banks must necessarily be narrow—a little more than a third of a mile in width; although it may be expanded to a greater width in places, but if so, it must be contracted elsewhere.

OUTFIT OF A REGIMENT.—To show in what consists the outfit of a regiment, we give the list: 720 cartridge-boxes, 70 box-belts and plates, 64 commissioned officers' belts and plates, 630 waist-belts and plates, 720 cup-pouches and pickets, 10 bayonet-sabers and frogs, 720 gun-slugs, 22 camp-kettles, 22 spades, 22 axes and helves, 11 pickaxes, 104 cup-kettles, 208 mess-pans, 14 wall tents, poles and pins; 70 knapsacks, 740 haversacks, 740 canteens. This of course is exclusive of the arms, which they are yet to receive. From the quartermaster's department they receive 70 caps.

IMMENSE.—The issue of the London Times of May 24th, 55, contained 2575 advertisements. This was considered immense, but a recent number totally eclipsed that. It contained 4000 separate advertisements.

Standish's Combined Reaper and Mower.

Since the appearance of the first reaping and mowing machines, men of mechanical genius have been busily engaged in their improvement, until at last we have a combined reaper and mower invented by an ingenious Californian, which will probably supercede all others at present in use. The inventor is Mr. P. H. Standish, at present residing at San Jose, Santa Clara county. The superior merits of this machine exist in the facts that, 1st—It is capable of doing more work in a given time than any other reaper and mower. 2d—That it does its work in better style. 3d—That it is simpler in construction. 4th—That it is less liable to get out of repair. 5th—That if it does get deranged in any manner, it can easily be repaired, and at trifling cost. 6th—That its price is infinitely less than that of any other machine. For the information of our farming friends we would state that we have secured the sole agency for this State, of this invaluable invention, and shall be happy to see or hear from any of them who desire to purchase county rights, or single machines. Letters must be addressed to "J. Silverthorn, Government House, San Francisco." We warrant the machine to give every satisfaction to purchasers. We are also ready to negotiate with Agricultural Implement makers, for its manufacture. A working model may be seen in the office of the MINING AND SCIENTIFIC PRESS, in San Francisco.

A number of these superior Reapers and Mowers are now in use in this State, and are highly spoken of by their owners. A few of the testimonials we have received are appended:

LAFAYETTE, June 27, 1860.

MR. P. H. STANDISH—Sir: We, the undersigned, did on or about the first of June, see your newly improved Calm Mower work, and, in our judgment, consider it one of the greatest improvements that has ever come under our observation, of the kind, and we cheerfully recommend it to the farming community, as it is purely a California invention, and contains many decided and valuable improvements.

G. W. HAMMETT, A. BALEWIN,
M. CROGER, CHARLES McARRON,
D. R. MEACIAM.

June 12th, 1860.

MR. STANDISH—Sir: Your Mower was tried in my clover meadow yesterday evening; it was rank thick grass and very much lodged. It performed well, as well as any machine could do. I saw it cutting oats in Mr. Harnett's field, and I am pleased with its performance. The cam wheel power over that of the cog wheel for driving a reaper knife must have a decided preference with farmers, on the score of economy, if for no other reason. There is no wear compared to the cog wheel power, which gives out and becomes useless in two years or seasons. The cam wheel will be as good after twenty years wear. I have no doubt of its being the right principle of driving the reaper knife, and when introduced into use will be preferred to the present cog wheel plan. It saves all the wear and tear of cogging-bearings and boxing, and if the plan is carried out and brought into use, it will save thousands of dollars to the farmers in buying reapers every two years.

Yours, with much esteem,

ELAM BROWN.

PACHECO, June 23, 1860.

MR. STANDISH—Sir: This is to certify that I have operated one of your mowing machines, and find it to be, in my opinion, one of the best machines for mowing that I have seen work in this State. I also think that the draft is easier than a cog wheel machine, and also that it will not clog in the knife or clog, or eat any grass.

Witness: Washington A. Wilson, W. T. Headrick.

LAFAYETTE, June 27th, 1860.

MR. STANDISH—Sir: I saw your mower at work in down clover and oats of very heavy growth; it performed better than any mower I have ever seen. For simplicity, durability and lightness of draft, it certainly has not its equal.

Respectfully, yours,

WARREN BROWN.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our heretofore extensive establishment, we can confidently announce to the public that we now have

The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty-five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp shoes and dies of iron, which is imported by us expressly for this purpose—its peculiar hardness makes shoes and dies last two or three months. Milling Pumps of all sizes and designs; Flouring Mills; Gang, Sash, Mule, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. One of these shingle machines can be seen in operation at Mett's mill in this city.

Knock's Amalgamator, with the latest improvements; Howland & Hancock's Amalgamator; Goldard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Frames; Horse Powers; Smit Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lam's Patent; and to make a long story short, we make castings and machinery of every description whatever, also, all kinds of Brass Castings.

Steamboat work promptly attended to.

Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

This MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and run with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before?" It would have Saved the Fortune of many a Miner expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe.
Bartola Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco.
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for Simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.

2d. Having two driving wheels, if one slips the other does the work.

3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.

4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.

5th. The whole weight of the machine is on the wheels, where it is needed to give power and stroke to the knives.

6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.

7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.

8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two-wheeled cart.

9th. It is mostly of iron, simple in construction, and a boy can manage it easily.

10th. It has no slide draft.

11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.

We invite Farmers wishing a machine to call and see before purchasing.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SCIENTIFIC American Patent Agency of Messrs. Munin & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interest of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a rejection, and for appealing it to the Commissioner, no additional fee will be required. In cases of Interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

The above is a cut of Wm. Brodie & Co's California Foundry, which is quite extensive, being 45 feet in breadth by 137 feet in length. Mr. Wm. Brodie worked for a long time in Donahue's Union Iron Works, and commenced operations in May of this year, on his own account. They manufacture in the very best style, saw and quartz machinery, stamp shoes and dies of white iron, amalgamators of every description, mining pumps, hoisting machines, and flour-mill machinery. The work principally done by these gentlemen (who are exclusively foundrymen) is housework, such as iron fronts, columns, &c. They employ 25 skillful workmen constantly.

LEPROSY.—This loathsome disease has made its appearance among the Chinese in Victoria, and the people of Australia have determined to stop the immigration of Asiatics in consequence. It is no uncommon thing to see Chinese lepers in San Francisco—but the coolie migration to our shores is not stopped. We wish it were.

THE CROPS.—The wheat crop in Napa and Sonoma counties promises an abundant yield. The potato crop in some parts of the Bodega country, is being fatally injured by that worse than Egyptian scourge—the grasshoppers. Many fields will doubtless be entirely destroyed.

AGRICULTURAL HALL IN STOCKTON.—The corner stone of the Agricultural Hall of the San Joaquin Agricultural Society was laid on the 7th inst., by the Masonic Order.

VINEYARDS AT STOCKTON.—The Helvetia Garden at Stockton, cultivated by Italian Swiss, has thirty thousand vines now in their fourth year. Detten's garden has seven thousand vines; Bruner's garden has twenty-one thousand vines—five-sevenths foreign.

THE SAN JOSE RAILROAD.—The President of the Board of Supervisors and Messrs. Dodge and Otis have been appointed a committee to attend the meeting of the stockholders of the San Jose railroad, and represent the interest of San Francisco city and county.

INDISCRETION.—An individual rather the worse for wine, in Carson Valley, made a bet of one thousand dollars, recently, that he could swim five miles up Carson river before another man could swim twice across the same stream. He found it an up-hill business to the amount of one thousand dollars. Experience is the best school to both wise men and fools.

LA PORTE.—A friend writes us from La Porte, that the town is building up again. The loss is not near so great as was at first supposed. There were many goods saved in the fire-proof cellars. Some of the gamblers had been notified to leave the town by a portion of the citizens. This may account for the appearance of some strange faces in our streets recently.—*Marysville Express.*

TEETH! TEETH!

PURE NATIVE SONOMA WINES.

RED, WHITE AND SPARKLING.

From Lachryma Montis Vineyard.

MANY FAMILIES AND OTHERS BEING DESIROUS OF PROCURING MY Wines, and having now a large quantity accumulated of the vintage of the last five years, I have determined on introducing them into the markets, for which purpose I have appointed A. S. Lowndes & Co. my sole agents, of whom the wines may be obtained in their pure state, as they come from my vaults in Sonoma. M. G. VALLEJO.

At the Depot, 617 Montgomery street, from this time we shall have in store a constant supply of all classes of the Lachryma Montis Wines, and parties purchasing from us may rely on obtaining the pure offspring of the grape. First Premiums and Diplomas have been awarded to Gen. Vallejo for specimens of his Wines, exhibited at the various Fairs held in the different parts of the State during the past four years, and having now attained some age, are for the first time brought into market. As dinner wines, and a general healthy beverage for this climate, the Lachryma Montis Wines cannot be surpassed. For sale in quantities to suit by
A. S. LOWNDES & CO., Agents,
617 Montgomery street, opposite Montgomery Block, San Francisco.

MINING AND SCIENTIFIC PRESS.

THE ONLY MINING, MECHANICAL AND SCIENTIFIC PAPER ON THIS CONTINENT.

SECOND YEAR! VOLUME III.—NEW SERIES!

A new volume of this extensively circulated paper commenced March 1861. It is intended that every number shall be replete with information concerning Mining, Scientific, Mechanical and Industrial pursuits, together with several original engravings, of new inventions, etc., prepared expressly for its columns.

This paper is devoted to the above purposes, together with the interests of Science, Arts, Agriculture and Commerce, and any general information that may be of interest to the reader; and it is the intention of the proprietor to spare no pains or expense in making it equal in interest and valuable information to any paper yet published.

The Mining Interest!

Will find it of great value, as it will contain all the news appertaining to Mining, the prices and sales of Mining Stocks, new inventions of Machinery adapted to that purpose, and of everything generally that may be of service to the Miner.

The Inventor!

Will find it an excellent medium for the purpose of bringing his inventions into notice, of ascertaining the progress of invention in this and other countries, and also of receiving any information that may be necessary in obtaining his patent, the proprietor having had great experience as Patent Agent, together with facilities at Washington that enable him to obtain Patents with dispatch.

The Mechanic and Manufacturer!

Will be greatly benefited by its perusal, as each number will contain several original engravings of new machines and inventions, together with large amounts of reading matter appertaining thereto. We are constantly receiving the best scientific journals from all quarters, from which we shall continue to extract whatever may be of benefit or interest to our readers.

To Chemists, Architects, Millwrights and Farmers.
This Journal will be invaluable. All new discoveries in Chemistry will be given, and a large amount of information of great service to Architects and Millwrights will be found in our columns. The Farmers and Planters will not be neglected, engravings will be given of agricultural implements, and the farming interest generally will be amply discussed.

TERMS.

To mail subscribers—Four Dollars per annum.

Club Rates.

Five Copies for Six Months, \$8.

Ten Copies for Six Months, \$16.

Ten Copies for Twelve Months, \$30.

Fifteen Copies for Twelve Months, \$44.

Twenty Copies for Twelve Months, \$56.

For all clubs of Twenty and over, the yearly subscription is only \$2 80. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

J. SILVERSMITH, Publisher,

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. III.

SAN FRANCISCO, SATURDAY, AUGUST 17, 1861.

NO 21.

We furnish our readers this week with an engraving of Dunning's Patent "Under Current Sluice"—a rifle-box and amalgamator, that will upon trial become very popular in all gold mining districts. The inventor, Mr. R. H. Dunning, a practical miner, of North San Juan, Nevada County, who has himself used the "Under Current" for over two years, thus describes his invention:

By means of two or more iron bars at the termination of a section of sluice boxes forming a right angle grating, a portion of the dissolved earth, fine gravel and water is separated from the lumps of hard earth, cobble stones and gravel, and drops into a set of more gently graded sluice boxes beneath, where they flow slowly off in another direction, while the body of water and coarse material dashes down a "dump" or "fall," to be again taken up in sluices with the tailings from the under current and subjected anew to separation.

This process is sure a more thorough amalgamation and saving of the particles of gold, the most of which drop through the grating into the under current, where, being subjected to a less violent motion and passing through a greater variety of riffles, they are more like to be finally arrested. It effects a large saving of rusty gold which will not read by amalgamate. It gives more opportunity for saving gold in a short distance, and to scour cement without loss of tailings and grade.

On hill sides, where there is abundance of space, it is a valuable adjunct to tail sluices, where the latter terminate at the river's edge, and would otherwise discharge all of their contents into the stream. The under current can be made to receive the best portion of the tailings and convey them for any distance along the bank. The immense friction of rolling rocks being removed, the under current effects a saving in false bottoms of about seventy-five per cent.

At San Juan Hill, Nevada County, where this invention was first introduced, and is now extensively used, it is considered a valuable improvement, saving both gold and quicksilver in much larger proportions than the ordinary sluice without it; the saving effected from tailings in one instance is equal to twenty-five per cent., and might be increased, the amount of economy of course depending upon the extent to which the under current is employed.

The under current sluice, besides increasing the amount of gold saved, also decreases the quantity of lumber used. Where there is sufficient "fall," the string of main sluices need be only two or three boxes in length. The "under current" can then be attached near the lower end of them, running away at right angles, as far the grade will permit, and then by an elbow returning to the main sluices, below the point of starting. Thus nearly all the lumber required, will be used in the string of under current sluices instead of the main sluices; and as main sluice boxes require new linings or bottoms every two or three months, whilst the under current boxes require new linings or bottoms only once in two or three years, the saving in lumber must be apparent. The under current sluice besides saving gold that from rust or other causes will not amalgamate, also arrests amalgam or quicksilver that would otherwise escape.

The general agent for the sale of this patent "under current sluice" in this State is J. Silversmith, proprietor of the Mining and Scientific Press—offices Nos 20 and 21 Government Block, corner of Sansome and Washington streets, San Francisco. Terms reasonable. Letters addressed to him

DUNNING'S PATENT

UNDER CURRENT SLUICE.

or to Messrs. Dunning & Crawford, San Juan, will receive prompt attention.

COST OF TUNNELING.—Since the comparative exhaustion of the surface diggings in California, the auriferous earth of which could be washed through temporary sluices and ditches following the natural inclination of the soil or base rock, it has been necessary to cut tunnels through the bed-rock in order to reach and wash the gravel beds lying in basins lower than the rim of the hills or ridges to which the paying deposits are now chiefly confined. The bed rock at the rim is often one hundred feet higher than in the centre of the hill 1,000 feet back, where the best paying gravel is found and must therefore be pierced, whether the dirt be drawn out in cars and washed in cradles, toms, or wooden sluices thereafter, or flooded away, tons at a time, by the rapid hydraulic process. The number of tunnels thus being cut in the State is enormous and constantly increasing, and the cost in time and money prodigious. In a single district three or four miles square there may often be found as many as fifty tunnels, from 300 to 1,500 and 2,000 feet long, mostly cut through rock, at a cost ranging from three dollars to fifty dollars per linear foot, frequently averaging twenty dollars. The parties who prosecute these works are generally without capital, and have given from two to six years of the most arduous toil to complete them, seldom with more than a confident hope to sustain their courage, as seldom realizing adequate reward in the sequel. After spending \$20,000, 30,000, or even 50,000, to gain access to, or open diggings, a mining company of six or twelve men is often unable to work them in a systematic manner that will alone insure profitable yields, and the prize, if it prove one, passes into the hands of creditors or capitalists. The cost of tunnelling operations is an immense obstacle to success in placer mines. We have known it to bankrupt whole communities in the Sierra Nevada, and for years have known that the great desideratum in the mining regions is machinery for cheapening the cost of tunnels. A reduction of this one item of expense to half its present amount, would increase in a much greater proportion the profitability of all branches of mining to which adits are indispensable. —*Marysville Appeal.*

UMPQUA SALT.—The *Oregonian* of the 30th of July, remarks: Samuel Hunsucker, of Douglas county, left in our office this morning four beautiful specimens of salt, manufactured at the Salt Springs in that county, five miles from Oakland. It is white, pure, and manifestly a good article for the table, for the dairy, and for preserving meats. It will well compare with salt made at Syracuse, New York. We learn that the water is abundant and that Dillard & Sons make at their establishment six hundred pounds, and Ward & Moore at theirs, four hundred pounds every twenty-four hours. These establishments will soon be greatly enlarged. Demands for the salt exceed the supply. It readily sells for three dollars and three dollars and fifty cents per hundred pounds. Increased facilities will enable the manufacturers greatly to increase the amount manufactured, and to reduce the price. The Umpqua country will be independent of the balance of the world for salt.

CORN FIELDS ON THE YUBA.

A drive up the Yuba river from Marysville, says the *Appeal*, reveals one pleasant and gratifying scene, despite the heat and dust which prevail at this season. The bottom lands adjoining the yellow stream are planted for miles in Indian corn. Thousands of acres of that beautiful grain are noticed in every stage of growth, from the delicate ribbons of verdure that just begin to curve toward the parent earth, up to the tasseled and ear-bearing stalks which stand in thick, luxuriant ranks ten or twelve feet high. The corn crop has been found very profitable, and is therefore much larger this year in Yuba than ever before. Some of the most advanced fields were planted after the same ground had yielded heavily of oat hay. The lowest land was planted after the subsidence from it of the late flood, which does not appear to have injured but benefited it for this grain. We have noticed hundreds of acres which were planted not longer than a month ago, the soil being yet moist. These late plantings will probably mature before the first frosts, and will at least furnish a good late supply of roasting and boiling ears for the Marysville and lower country markets. It will be seen that a very efficient and profitable mode of utilizing the flooded bottom lands of the valleys has been tested by Yuba county farmers, whose fields of waving corn, stretching beyond the eye's reach, remind one of the corn fields of the Mississippi prairies.

CALIFORNIA TROOPS.—In accordance with a requisition from the Secretary of War, Governor Downey has issued his proclamation, calling for one regiment of Infantry and five companies of Cavalry for service on the plains. The call has been responded to with alacrity, and the troops under the command of Colonel Carleton, of the U. S. Army, will shortly march. We are confident that wherever they may be, whether in conflict with Indians on the plains, or with the rebels of the Southern States, they will make their mark, and uphold before the world the reputation of Californians for dare-devil bravery.

CHEAP SILVER.—A German chemist professes to have discovered a mode of manufacturing silver for seventy-five cents per ounce, and has formed a company to work it extensively. The only appliances used are a few chemical preparations operated on by galvanic batteries.

NEW STEAM GUN BOATS.—The new gun boats for the navy are intended to excel in speed and strength any vessels of their description afloat. Their dimensions will be one hundred and fifty-eight feet in length on the load line, twenty-eight feet broad and twelve feet deep. Each vessel will be pierced with six ports on each side for thirty-two pounders. Also a port on each side for a ten inch columbiad pivot gun. They will be propelled by two horizontal back-action engines with thirty-six inch cylinders and eighteen inches stroke. Liwall's surface condensers will be used. Each engine will be complete in itself, and can be worked independent of the other. They will have two of Martin's tubular boilers, each having a grate surface of eighty-eight and five sixths square feet, and two thousand seven hundred square feet of heating surface. An auxiliary engine and boiler will be attached to each for pumping purposes, and to propel a Dumphel blower to furnish draft to the furnaces. The screw will be fixed; not busting out of the water like those of our steam frigates and will be four bladed, of the most approved pattern. When these vessels are completed and ready for sea, about two hundred men including officers, will be required to man them; and armed with twelve long thirty-two pounders and a ten inch gun, and possibly an improved rifled cannon. They will be a most formidable war vessel. It is presumed that they will draw, when fully manned and ready for a cruise, less than ten feet of water, which would enable them to run into shoal water; and the bars, banks, and shoals, which prevent the passage of larger vessels, would not be heeded by these boats. Their speed should not fall short of from fourteen to fifteen knots under steam aloe, and with canvass set at least one and a half knots should be added to the momentum. It will require about four months to complete these boats and have them ready for sea service.

CURIOUS CALCULATION.—The vast number of inhabitants who do live and have lived on the face of the earth, appears at first sight to defy the powers of calculation. But if we suppose the world to have existed six thousand years; that every past generation averages the present; and that four individuals may stand on one square yard, we find that the whole number will not occupy a compass so great as one fourth the extent of England. Allowing six thousand years since the creation, and a generation to pass away in thirty years, we shall have two hundred generations, which at one thousand millions each, will be two hundred thousand millions, which, being divided to four persons to a square, will leave fifty thousand millions of square yards. There are in a mile three millions, ninety-seven thousand, six hundred square yards; by which, if the former sum be divided, it will leave sixteen thousand one hundred and thirty-three square miles, the root of which in the whole numbers, is about one hundred and twenty-seven, so that one hundred and twenty-seven square miles will be found sufficient to contain the immense and almost inconceivable number of two hundred thousand millions of beings.

THE ACT APPROPRIATING MONEY TO THE AGRICULTURAL AND MECHANICAL SOCIETIES.—Section first of this act, passed by the last Legislature, reads as follows: There is hereby appropriated, out of any money in the State Treasury not otherwise appropriated, the sum of \$5,300; to the treasurer of the Northern District Agricultural and Mechanical Society, to the treasurer of the San Joaquin Valley District Agricultural and Mechanical Society, to the Treasurer of the San Francisco Bay District Agricultural and Mechanical Society, the sum respectfully of \$1,000 to each; to the treasurer of El Dorado County Agricultural Society the sum of four hundred dollars; to the treasurers of Contra Costa, Siskiyou, and Plumas Counties Agricultural Societies, the sum respectively of three hundred dollars each, on requisitions on the Treasurer of this State, signed by the Presidents and Recording Secretaries of said societies respectively; which said sum shall be used for the purpose of paying premiums, and for no other purpose.

HOW TO CLEAN A GUN.—No one should put away a gun without cleaning, not even if it has fired but one shot, that one barrel should be cleaned. First take the barrels off the stock, and immerse them in cold water about four inches deep. Then wrap some stout cloth (tow clings to the barrels and leaves particles in them) about the cleaning rod so thick that you will have to press rather hard to get it into the barrels; then pump up and down, changing the cloth till the water comes out clear; then pour hot water in them, stopping up the nipples, and turn the muzzles downward. Then put on dry cloth and work till you can feel the heat through the barrels, and the cloth comes out without a particle of moisture on it. Then put a few drops of clarified oil (made by putting rusty oils into some good salad oil) on the cloth and rub the insides; rub the outsides all over and then put the gun away.—*Porter's Spirit.*

SYRUP FROM WATERMELONS.—A man in Ross county, Ohio, states that he had made last season, from watermelons grown on one acre of ground, eighteen barrels of syrup, which sold for eighty cents a gallon; giving four hundred dollars for the acre of ground and the labor. The process is as follows: Take only the soft part of the melon, rub it through a wire sieve into the barrel, then strain out the juice in a copper kettle, just as you would cider or maple sugar water, and be careful not to scorch it when nearly done.

NEW INVENTION FOR SAVING SHIP TIMBER.—A machine, the invention of H. S. Vrooman, is now on exhibition in model form, in New York, which is described as one of the most ingenious and useful that has been brought to public notice for some time. The merit of the machine is that timber can be sawed with all the various curved, leveled and winding surfaces required in ship building. For many years some of the master mechanics of Europe—among them the famous Brunel—have been engaged in trying to effect just such a result in mechanism. The honor, however, falls upon an American inventor. In this machine the saw is hung in a turning and sliding frame and is controlled by two guides one of which determines the curve and the other the level. The adjustment of these guides to the form of surfaces cut, has that precision which is characteristic of machine work.

PHELAN'S BILLIARD SALOON.

THE ABOVE BILLIARD SALOON, WITH EIGHT FIRST CLASS PHELAN TABLES, is now open to the public. The Cushions on these tables are the latest patent, and are a great improvement on their predecessors. The ROOM is fitted up so as to combine ELEGANCE with COMFORT. The BAR will be kept constantly supplied with the very choicest brands of

WINES, LIQUORS AND SEGARS,

And the subscribers hope, by strict attention, to merit the patronage of all who admire and practice the GAME OF BILLIARDS. DAN LYNCH, 720 Montgomery st. op. Metropolitan Theatre. M. E. HUGHES.

The subscriber begs to inform the public that the above mentioned Billiard Saloon is also intended to serve as a show and salesroom for

Phelan's Patent Combination Cushions and Model Billiard Tables,

And Billiard Trimmings of every description. Parties desirous of purchasing Billiard Tables will thus have an opportunity of selecting from a varied assortment, both in style and finish, and can also test the superiority claimed for the Cushions and Tables. Mr. DAN LYNCH will always be on hand, and ready to give all required information with regard to the merits of these JUSTLY CELEBRATED BILLIARD TABLES. The subscriber cordially invites all interested parties to call and examine. M. E. HUGHES, Agent for Phelan's Patent Combination Cushions and Modern Billiard Tables

BERGER'S BIJOU BILLIARD TABLES,

With PHELAN'S PATENT COMBINATION CUSHIONS.

The subscriber desires to inform the public that he has now on exhibition at

Phelan's New Billiard Saloon,

Montgomery street, opposite the Metropolitan Theatre one of the above mentioned BILLIARD TABLES, and cordially invites the patrons of the noble game to call and examine it. The Great Master, Mons. Berger, speaks of the Tables in the highest terms of commendation. To private families these Tables commend themselves, especially on account of their convenient size, and as an article of furniture for a private dwelling there is nothing more desirable; in short, no household or mansion with any pretensions to being well regulated, should be without one. Gentlemen about to build residences should by all means make provision for a BILLIARD ROOM, where their family can enjoy the noble, graceful, and health-giving game of Billiards.

And Agent for PHELAN'S PATENT COMBINATION CUSHIONS, etc., etc. Exhibition and Salesroom, No. 720 and 722 Montgomery street. Jy13

SPRING VALLEY WATER WORKS CO.

S. E. corner Montgomery and Jackson sts., San Francisco.

WATER! WATER!! WATER!!!

Water will be let into the pipes of the Spring Valley Water Works, this afternoon, (July 19) in addition to that heretofore let on, in the following streets:

In Brannan, from the corner of Harris to Third street. In Third street, from Brannan to Townsend. In Third street, from Brannan to Folsom; including South Park. Also, from corner of Third and Harrison to Harrison and Fourth streets. All parties desirous to have the water introduced into their premises will please make application for the same, at the Office of the Company. Jy20 A. W. VON SCHMIDT, Chief Engineer.

OFFICE OF THE SAN FRANCISCO AND SAN JOSE RAILROAD COMPANY. San Francisco, July 10, 1861.—Notice is hereby given that a meeting of the Stockholders of said Company will be held at the office of said Company, in the city of San Francisco, on the SECOND MONDAY (the 12th) of August next, commencing at 10 o'clock A. M. and closing at 4 o'clock, P. M. on said day, for the purpose of electing seven Directors of said Company, to serve for the ensuing year. By order of the Board of Directors of said Company. Jy20 T. DAME, Secretary.

PURE NATIVE SONOMA WINES.

RED, WHITE AND SPARKLING.

From Lachryma Montis Vineyard.

MANY FAMILIES AND OTHERS BEING DESIROUS OF PROTECTING MY Wines, and having now a large quantity accumulated of the vintage of the last five years, I have determined on introducing them into the markets, for which purpose I have appointed A. S. Lowndes & Co. my sole agents, of whom the wines may be obtained in their pure state, as they come from my vaults in Sonoma. M. G. VALLEJO.

At the Depot, 617 Montgomery street, from this time we shall have in store a constant supply of all classes of the Lachryma Montis Wines, and parties purchasing from us may rely on obtaining the pure offspring of the grape. First Premiums and Diplomas have been awarded to Gen. Vallejo for specimens of his Wines, exhibited at the various Fairs held in the different parts of the State during the past four years, and having now attained some age, are for the first time brought into market. As dinner wines, and a general healthy beverage for this climate, the Lachryma Montis Wines cannot be surpassed. For sale in quantities to suit by

A. S. LOWNDES & CO., Agents, 617 Montgomery street, opposite Montgomery Block, San Francisco.

A Word to California Farmers.

We observe that the millers of California are bent upon making the farmers furnish them clean instead of dirty wheat. The millers of Yuba county, according to the *Appeal*, have declared that they will not encourage this nuisance any longer, and producers may be sure that wheat which was the refuse of their threshing ground and a heterogeneous admixture of unmerchantable rubbish in it, will find its proper price, and be classed with "rejected" or "inferior," when, with due care, it might command the highest current rates. There is no excuse, with the present present prices, for such a shiftless policy as has heretofore been pursued by our farmers, and it is to be hoped that this year's crop will be able to redeem the reputation of California wheat in foreign ports.

The *Napa Reporter* says, in connexion with this subject: We see by some of our late exchanges, that the large quantities of barley, oats, etc., present in the wheat shipped from California, has tended materially to depreciate it in value; and our farmers, and all interested in the grain business, should pay particular attention to this fact if they want a market to ship their surplus grain to. Practical millers have always felt the want of complete and perfect machinery for cleaning grain, or rather separating not merely wheat from chaff and foul matter, but the wheat from the oats and other grain, which is often mixed in growing; and ingenious mechanics have experimented a great deal in trying to produce the machinery so much desired. Hitherto, but partial success has attended their efforts. It is with great pleasure then, that we call the attention of our farmers, millers, and the interior press, to the fact, that this want can now be supplied by the purchase of Turner's Improved Combined Smutter and Grain Separator—the most perfect machine of the kind in the world. It has no equal in scouring, separating, and otherwise cleansing grain from smut, chaff, grown wheat and other impurities. As wheat always contains, when brought to market, more or less smut, dust, chaff, and other foul stuff, and in passing it through a smut mill, if the grain be the least damp, the smut, dust, etc., are liable to adhere, it is absolutely necessary that the smut balls should be taken out unbroken, before the grain enters the smutter, and the dust pass out as soon as scoured from the berry, that the grain may not wallow in it.

In this machine, the smutter is composed of from three to seven sets of horizontal scouring plates between which the grain passes. The lower plate or runner of each sett is provided with beaters, which throw the grain against the upper plate, which is stationary and also provided with beaters, thereby causing the grain to act against both plates with equal certainty and uniformity. A rough or sharp surface is not depended on for scouring, but it is claimed that what the machine will do the first month it will continue to do for years in the same manner.

The grain enters at the top, where it first falls upon a zinc or sheet iron riddle, through which the grain passes, taking off sticks, stones, etc., over it. The grain then falls upon the first inclined plane, then into the first blast from the fan at the bottom of the machine, which takes out most or all of the smut balls, Oats, Chaff, and other light impurities, before the grain enters the smutter. This all millers know to be of the greatest importance, particularly if the grain be damp. The grain then passes out of the blast of the separator into the smutter, the dust passing through the perforated case opposite each set of plates, and drawn up into the top fan and carried out of the Mill if desired—the grain passing through the smutter, discharging the heavy screenings at the angle in the enlarged spout.

The Machine is well ventilated, by a blast from the lower fan into the center of the Machine, by which there is no possibility of its ever becoming filled up or clogged with dust.

This Machine makes five distinct separations: 1st. The heads, sticks, etc., over the Riddle. 2d. Screening from the first blast, (which are the lightest,) and before the grain enters the smutter. 3d. The dust. 4th. Screenings from the second blast of the separator, after the smutter. These last are free from dust, and in good condition to grind for feed or otherwise. 5th. The clean grain, at the bottom of the Machine.

Only one driving belt is required, and but two in all—and can be as easily attached as any upright smutter. Rolling screens may be dispensed with, except for cockle.

The step of the smutter shaft is the only place from whence arises any danger from fire, by the friction of the smut mills; hence the absolute necessity of having the step always in sight, and convenient to be oiled, with no liability to run dry, from its situation being unapproachable without taking the Machine to pieces. All millers, and all vigilant and competent Insurance Agents, should thoroughly examine all smut mills and report to their principals,—whether the step of the Machine can be examined daily,—its facility for oiling,—its contiguity to wood,—the velocity of the Machine, and its liability to clog with dirt. As sad mistakes have been made in this important matter, all parties interested are particularly requested to examine this Machine. Aside from any danger from fire, the convenience of the miller should be consulted. He is desirous of knowing and should know to a certainty, that the step is oiled and in good order, and this he should be able to ascertain with as little trouble as possible, and as often as desired. In this machine the step is always in sight, and can at all times be examined and oiled as easily as any ordinary journal. It holds nearly half a pint of oil, and can at any time be drawn off and replenished. No

grit or dirt can remain in the step, but will be thrown off into a lower cavity. From these considerations the Machine is regarded fire-proof.

Millers and farmers desiring to obtain this valuable machine can do so by applying to J. S. LYERSMITH, proprietor MINING AND SCIENTIFIC PRESS, No. 20 and 21 Government House, San Francisco—he being the sole agent for California. He would also be happy to confer with parties desirous of purchasing the right to sell the "Combined Smutter and Grain Separator," in any county of the State.

TO INVENTORS AND DISCOVERERS, MECHANICS AND MACHINISTS!

The undersigned, having had great Experience and Facilities for completing and carrying out Inventions and Improvements upon all kinds of Machinery and Implements, also preparing the requisite Drawings, Models, Drafts and Specifications, and is otherwise conversant with all principles in Mechanics of modern practice and could prove, therefore, of invaluable aid to Inventors and Discoverers. Those contemplating bringing their inventions in a proper shape before the U. S. Patent Commission are particularly requested to consult the undersigned.

QUARTZ MINERS, ATTENTION!

DR. DEERS would call particular to his Improved
AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz.

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.

2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.

3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other; three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required. The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, at First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,
J. B. DEERS

Ma15 165 Clay street,

CALIFORNIA COAL MINING COMPANY.

CAPITAL, \$5,000,000

IN 50,000 SHARES.

THE BOARD OF DIRECTORS and Trustees of the California Coal Mining Company, give notice to all parties disposed to invest in the Stock of the Company, that Ten Thousand Shares, of \$100 each, of the said Stock are reserved for that Purpose, by resolution of the Board.

The Books of Subscription are open at the office of Tische & Bayerque, where the required first instalment of 10 per cent. will be received.

F. L. A. POCHE, President.
m28 J. H. APPELEGATE, Secretary.

AGENCY FOR PATENTS.—The undersigned having been long established in the Patent Agency Business, and having favorable arrangements for attending to the interests of inventors at the Patent Office in Washington, offer their services for the securing of Privileges and Patents also, will attend to the sales of Patent Rights, and to all matters connected with patented inventions.

WETHERED & TIFFANY,
Office, Market street opposite Montgomery

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....AUGUST 17, 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 29 & 31 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At Fifty Cents per month, or \$4 per annum, in advance.

Advertisements, Fifty Cents per line.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. STENOGRAPHY and ELECTROTYPE, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. W. R. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

In Their Right Sphere.

Near one thousand hands are at this moment actively employed in finishing and completing mining and metallurgical machinery for the many mining companies. The river couveyances are daily laden with engines and machinery of every description, destined nearly all for the new silver fields of Nev. Territory Esmeralda, and Mexico. For a number of years our leading foundries have been struggling to compete with foreign firms in the manufacture of articles of little or no use to Californians. They have lately, however, changed their tactics, and are now manufacturing implements which are mostly invented by citizens of this State, are of great practical use in our mining and agricultural regions, and meet with a ready sale.

In consequence of this step, and the increasing demand, iron has risen in price from 3 to 7 cts. $\frac{3}{4}$ lb, but as the price of labor, on the other hand, has been reduced, it makes little or no difference, and machinery is manufactured at the same rates, viz., but little above the price it would cost in the Eastern States or Europe, and when the cost of transportation is considered, and the lapse of time between giving an order and receiving the article called for, it must be obvious to every person that quite a saving is effected by ordering implements, machinery, &c., from California foundries.

SAN JOSE RAILROAD.—Supervisor Otis reported to the Board of Supervisors the other evening, that in accordance with instructions, the committee appointed for that purpose had attended the election for Directors of the San Jose Railroad Company, and deposited the votes belonging to the city of San Francisco. But he at the same time complained that although the city was allowed to subscribe \$300,000 to build the road, she is not allowed to have a voice in the direction, as the stock held by Messrs. McLaughlin and Houston is much greater, and they have the sole control of the elections. Mr. Otis thought this city entitled to at least one Director, but it appears the contractors can elect all their own Directors and other officers. We presume, however, that the counties of San Francisco, San Mateo and Santa Clara, can, by casting their votes as a unit, elect a sufficient number of Directors. Without such unanimity they can hardly expect to be represented in the Board. The following gentlemen were elected members of the Board: Peter Donahue, C. B. Polhemus, H. M. Newhall, B. T. Mann, F. Dame, T. G. Phelps, and G. H. Bodfish, all prominent and responsible and energetic men, well known in the community for their strict integrity; with such Directors, the citizens of San Francisco are well satisfied. The following is an exhibit of the amount of stock subscribed for or yet untaken:

County subscr., 6,000 shares.....	\$600,000,000
Individual subscr., 11,209 shares.....	1,120,900.00
Stock to be paid to McLaughlin & Houston as per contract, 1000 shares.....	100,000.00
Stock not subscr. for, 1791 shares.....	179,100.00

20,000 shares \$2,000,000.00

The work has progressed under the contract quite briskly. About three miles have been graded, one and a half miles on each side of Francisquito Creek.

COUNTY HOSPITAL STATISTICS.—The annual report for the year ending July 1st, 1861, shows that on the 1st July, 1860, there were in the San Francisco County Hospital one hundred and thirty-nine patients, since which time eight hundred and sixty-four have been admitted, making a total of 1003. Of these five hundred and twenty-seven have been discharged as cured, one hundred and thirty discharged at their own request, and one hundred and fifty-three died, so that at the end of the year there remained one hundred and ninety-three patients.

UP-COAST COD FISHERIES.—The Port Townsend Register says: Within the last three months the cod fish have, in fisherman's language, struck into Fuca Straits in greater quantities than ever known before by the white settlers. The Cape Flattery Indians have taken them in great numbers, and the consequent trade with the whites has been pretty lively. Last week the schooner Sarah Newton, brought up some two thousand pounds of pickled codfish, besides five or six hundred pounds of dried fish to be shipped to California.

HUNT'S SPIRAL-FLANGED MISSILE.

The above illustration is one *appropos* to this period of our American Independence. Simple as it may appear, it is calculated in all probability to supersede nearly all the projectiles now in use, of which an innumerable quantity have been presented to the notice of the Government. Mr. Hunt stands renowned for some unrivaled inventions, recently patented by him. Many citizens who have examined a model of the valuable invention above represented, speak knowingly of its originality and usefulness.

The following is a condensed description of its advantages, simplicity, &c., taken from the application of letters patent through the American & Foreign Patent Agency by the proprietor of this journal. Mr. Hunt proposes to furnish a projectile, cast either in lead, iron or other metal, with any number of flanges which, as will be seen in the illustration surround the missile spirally; it may be cast either hollow or solid, and matrixes for this projectile would have to be provided. This invention does not confine itself to merely one class of arms, but may be universally applied to all kinds of fire-arms, from a $\frac{1}{4}$ inch bore pistol to the largest sized calibre cannon of smooth bore.

This new projectile effects a great saving of labor and expense in the manufacturing of fire-arms, such as grooving, finishing, and subsequently keeping them in order. Many discarded fire-arms now lying in the arsenals may yet be brought into requisition in the present struggle, and, if we err not, will do good duty.

It is cast oblong for the purpose of applying any required number of flanges (say from two to six) as may be requisite. When this projectile is fired off, the action of air on these flanges will give the missile an exceedingly rapid rotary motion, which serves to keep it perfectly straight in its course. The rotary motion lessens gravitation, and facilitates its destructive errand. Mr. Hunt is about preparing some of these projectiles for testing; he, and those who have examined the subject scientifically, are sanguine of its complete success.

Wheat Speculators.

Farmers complain that the wheat speculators in this city—especially those who purchase for export—have entered into a combination to lower the price of that grain below a paying figure.

The new crop is just coming in, and buyers are under an impression that the yield has been extensive, and that farmers will be compelled by their wants to hurry the grain to market, and to sell it for any price they can get. Certainly no other considerations can influence the purchasers in their cutting down operations, for the price of wheat abroad is quite up to a figure that allows a paying price to the producers, and also a handsome profit to the shippers. As to the yield of wheat this season, considering the ground sown, we are assured by cultivators that it is much below the yield of former years. In the San Ramon, Santa Clara, and Napa valleys, on an average, fifteen acres of land have only produced as much wheat this year as ten acres did last, and as there has not been one third more of ground sown this year than there was the last, the probabilities are that the total crop will not equal that of 1860. Moreover the farmers have become somewhat more easy in their circumstances than formerly, and a large portion of them are not obliged to sell, and will not sell their wheat unless they can obtain enough for it for the seeding and harvesting. To pay them a reasonable price—enough to cover cost of labor interest on capital invested, etc.—they say wheat must bring in this market one dollar sixty-five cents per hundred pounds, a price which would leave them one dollar and fifty cents, the remaining fifteen cents per hundred pounds being consumed in freight, wharfage, toll, storage and commissions. At present prices, wheat does not realize these prices, and we hear of numbers of large farmers who have determined to hold back their grain for an advance, and then, in case matters do not improve with them, not to put in crops for next year. Considering the condition of affairs with the farmers, and the fact that the price of wheat abroad is sufficient—with more than a fair prospect of continuing at such figures—to allow them all they ask, we cannot help thinking that the exporters are standing very much in their own light in endeavoring to keep down the price of grain. Their policy is, in fact, just the foolish one calculated to kill "the goose which lays the golden egg."—Call

SAN JOAQUIN AGRICULTURAL SOCIETY.—This society, organized in March 1860, has been a remarkable success. Its field of operations embraces the counties of San Joaquin, Calaveras, Tuolumne, Stanislaus, Merced, Fresno, Tulare and Mariposa, Stockton is its headquarters. One of the first steps taken by the Society, was to secure title to sixty acres of land one mile from this city, at a cost of \$1,500. This they fenced substantially, and put up two hundred stalls and a large two-story stand, capable of holding one thousand persons within the enclosure. Subsequently Capt. C. M. Weber donated to the Society a contiguous lot of ground, containing 60 acres—making, with the first purchase, a square tract of one hundred and twenty acres, which is now valued, together with its improvements, at \$12,000. Last year the fruits and articles of industry exhibited at the first District Fair were displayed within a wooden pavilion, two hundred by eighty feet, erected temporarily within the grounds on Court House Square, at a cost of \$1,000. The citizens of Stockton and of this county paid for the improvements made upon the cattle grounds and race track, and in addition contributed \$1,000 from the county and \$500 from the city, for premiums. The financial condition of the company is thus stated on the 1st of December last: Amount of money received since its organization, on the 1st of February preceding, \$12,766; amount disbursed, \$12,433; amount paid for premiums, \$2,213; value of property on hand, twelve thousand four hundred dollars. Last year the Society realized from annual, for which the constitution charges five dollars each, two thousand two hundred and forty dollars, which gives a list of 450 members; also fifty dollars from the sale of two life memberships, which the constitution fixes at twenty-five dollars each. This year we presume the annual and life memberships and all contingent resources of the Society have increased. At all events, they now have in process of erection on San Joaquin street, near the centre of this city, a magnificent brick edifice, 120 by 63 feet, exclusive of portico, to be built in the Corinthian style of architecture, elegantly furnished from cellar to coping, and ready for use on the first of September. When completed it will be the finest structure in the city. The portico will project ten feet outward from the front wall and will be separated by four Corinthian pillars. At the entrance will be four rooms and a passage way or vestibule, the latter 16-10x12 feet; three of the rooms being the same size, and the fourth one 16-10x10-6. The remainder of the building will be a grand hall one hundred feet long by 59-8 in the clear, height proportioned to area. It will furnish ample space for the display of whatever fruits and articles of art or industry the district is likely to produce for several years to come. In another number we shall again advert to the affairs of this Society, and to the list of premiums—valued in the aggregate at over four thousand dollars—which will be distributed at the second Annual Fair to be held in this city on Tuesday, Sept. 10th.—Stockton Independent.

—
CALIFORNIA.

Sierra County.—The St. Lawrence Company, at Excelsior Hill, Sierra county, took out in one week, lately, 120 ounces of gold.

Humboldt county.—The Stockton Argus learns from a gentleman from Humboldt, that the people of that county are exercised upon the question of coal oil, the veritable oil having been found in the southern portion of that county, below the mouth of Eel river, in Matole and Bear river valleys. There are a number of springs where the oil makes its appearance upon the surface. They are at present prospecting by digging wells to reach the main deposits.

tralle. Some three years ago gold was discovered at Pike's Peak. An immediate rush was made for that region. 20,000 thousand persons were there at a time on the plains. A few who reached the supposed mines pronounced it a humbug, and returned home, but the majority remained, and after a few weeks, about twenty years out of thirty returned to the States. There are now some 20,000 people or more in the Pike's Peak region, two considerable cities, several towns, a great number of quartz mills running, one furnace for converting iron into bars and castings, one furnace for converting iron ore into bars and castings, large numbers of gold diggings worked, some silver diggings opened, two weekly and one daily paper published, and a number of small stores and saloons. The country is now so settled that the farms opened about, and emigrants constantly coming in, and Pike's Peak, now the Territory of Colorado, is making permanent growth. And so will be with the mining regions in the mountains and gulches of the New Mexico country.

A recent letter from Oro Fino city to an exchange, conveys the following information: "We are not yet settled in finding any thing, but we will open up almost every foot of ground that will pay is claimed by some individuals. The diggings on all the creeks, so far as I have seen are deep—from six to eight feet—and the country is very flat. The consequence is, that a heavy outlay of capital and labor is required before miners can get into their claim. The mines so far covered, are limited about, Oro Fino and about the same distance below this place.

OREGON.

The Argus announces the arrival at Oregon city of Jas. M. Parlow, Esq., of the Wenatchee mines. He says that about one hundred and fifty miners are working there, and that they are making from ten dollars to fifteen dollars a day. Whilst coming in, and near Priest's Rapids, he was attacked by some half a dozen Indians, who showed a disposition to kill him. He had a fleet horse and escaped in company with a boy that was with him. Mr. P. says the Indians evince a hostile spirit, and that the chiefs are making strenuous efforts to produce a combination of the different tribes, for the purpose of driving out the whites from that region. He says he supports no claims, and that he has more than four hundred Indians at the Snake as well as other tribes, will make war upon those who are determined to visit the new mines on Salmon river. . . . Capt. Pierce has recently prospected Butter Creek—a stream which makes out from the Blue Mountains, and reports rich gold diggings. He is now out with a party designing to prospect the country thoroughly. . . . The Mountaineer editor has been up to Lewisville. He says: "Of the number of the California mine, I have no doubt. The grubbers are confined to Willamette Valley farmers; and add an important fact that he is well satisfied that hosts can be built to navigate the Snake river during the whole of the open season. . . . The Julia brought down on the 8th of August, in dust, \$-5,000 by express, and from \$8,000 to \$10,000 in private hauls. . . . The Overland Press gives unfavorable accounts of the new mining region. It says that the Wenatchee mines are decided failure. The miners are leaving, some for home, and some for the Nez Perces.

ROAD FROM RED BLUFF TO THE HUMBOLDT.—The rich mines of silver, gold, copper and lead of the great basin, reaching east and west, from Salt Lake to Honey Lake Valley, are just beginning to attract the attention of the capitalist and the hardy miner of California, and the day is not far distant when millions of dollars will be taken out daily from the rich ledges in that country. Red Bluff, says the *Beacon*, has the geographical position to command the whole of the trade in the large section of country embraced between the 37th and 43rd degree of longitude, and between the 39th and 42d degree of latitude. This section contains over 75,000 square miles, and is probably as rich a mineral country as any on the face of the globe. The Sierra Nevada can be crossed just to the east of us, in two of the easiest passes ever yet discovered over that formidable range of mountains. The road from this place to Honey Lake Valley by the way of Battle Creek Meadows and Mountain Meadows, which was viewed out and partially built last season, is not only a direct route to the former place and the new mines on the Humboldt, but can be made with but a comparatively trifling cost, one of the best mountain roads in California. It is not a road over ninety-five miles from here to Susanville. Two thousand dollars would make it a road over which as heavily loaded wagons could travel as the one from Red Bluff to Yreka.

BRASS AND COPPER TUBES.—It was until recently regarded as impracticable to make a pure copper casting, sound, solid, and perfectly free from blow-holes: but repeated trials for many years, and the expenditure of large sums of money, finally overcame the difficulty of such casting. The tubes are made from a tubular casting which is being extended by being drawn through dies, on steel mandrils—any imperfection in the casting of course causing an imperfect tube. The advantages possessed by seamless copper tubes over the common brazed ones, are very obvious upon inspection. Being highly polished on both sides, they resist the formation of scales, and consequently conduct heat more rapidly. Being tapered on the inside, they have the advantage of a heavy fire-box end, where they are most exposed to wear; and as they are perfectly cylindrical in section, they are more easily set and with less hammering, leaving the metal in a better condition for re-setting in case of a leak. Being stiff and perfectly straight they will keep their position in the boiler better. These tubes are also less expensive than the common brazed ones, and are thus suitable for a variety of purposes, such as pump-linings, paper rolls, hand-rails, &c.

GOVERNMENTAL EXPENSES.—England is spending seventy million pounds; The French Government acknowledges to an expenditure of approaching £75,000,000; the Russian Government acknowledges that its liabilities amount annually to £55,000,000 (or in Russian coinage, 275,000,000 roubles); and the Austrian Government, having survived at once capital and credit, is eking out the income required to meet a reckless expenditure by begging and stealing throughout its provinces in a degree which renders its total realizations incomputable, but still immense. Prussia, however, one of the most prominent of the military powers of Europe, professes to pay its way respectably for something over £20,000,000. The interest on the public debt of Prussia does not exceed 14,000,000 thalers, or £5,100,000 of our money; the Prussian national debt not exceeding £60,000,000. Prussia is the most fortunate State in Europe in regard to its debt, and the Prussian army is maintained at a cost of only 30,000,000 thalers a year, or less than £5,000,000.

A COSTLY WORK.—At the Greenwich dinner, a few days ago, Mr. Black read the following statistical paragraph respecting the seventh and eighth editions of the "Encyclopædia Britannica":—"Amount paid to contributors and editors, £40,970; cost of paper, £52,503; of printing and stereotyping, £36,708; of engraving and plate-printing, £118,277; of binding, £22,613; of advertising £11,081; of miscellaneous items, £2,269; making a total cost of £284,421. Of these two editions of the "Encyclopædia Britannica" there have been printed 10,000 copies. The amount of duty paid upon the paper, calculated at 1½d., was £8,573; but 3d. a pound was paid on a considerable part of the seventh edition. These figures indicate the magnitude of this literary enterprise. —*Liverpool Albion*.

AFRICAN EXPEDITION.—Mr. Petherick, British Consul at Khartoum, Africa, under the auspices of the Geographical Society, is about to start on an expedition from Khartoum direct South, in the hope of meeting Capt. Speke, another distinguished traveler, who is to leave Zanzibar, and push his way north to that immense lake lately discovered, and which is now supposed forms the source of the Nile. The discoveries of Livingstone have given a great interest to this portion of Africa also, and it is fondly hoped that Petherick and Peke's expedition may unravel all the mysteries which have surrounded that wonderful river for scores of centuries.

BLIND CATTLE.—The cattle blindness which has effected so many herds is so far as we can learn, at present confined to the Valley of the Sacramento. It is said that a resident of Yuba cures it by cutting away the film. If this be so, the loss of cattle by blindness will not be great, as almost any handy man can be his own veterinarian, in the premises.

The new Dundee (Scotland) whalers are being fitted up with screws and steam engines.

PRINTING OFFICE REMOVAL.

THE COMMERCIAL BOOK AND JOB STEAM PRINTING ESTABLISHMENT

Has been removed to the New Office,
No. 517 Clay and 514 Commercial Streets.

Book Printing, Law Briefs, Catalogues, Business Cards, Hand-Bills, Circulars, Theatre Work, American Flags, Envelopes, Badges, Bills of Fare, Programmes, Posters, Legal Blanks.

We keep constantly on hand and for sale, an assortment of

NATIONAL FLAGS AND BADGES,

In beautiful and extensive variety. Sole manufacturer of the

NEW UNION ENVELOPE,

With original and Patriotic verses. Everybody should use it.

Our Office is complete and perfect in every respect,

And we shall endeavor, in the future, to merit a continuation of that patronage which we have heretofore so generously received.

VALENTINE & CO., PROPRIETORS.

Please call and give us a trial.

A. KOHLER,

NO. 178 WASHINGTON STREET, SAN FRANCISCO.

Forty Cases of Musical Instruments Just Received,

Such as ACCORDEONS, FLUTINAS, GUITARS, VIOLINS, BRASS INSTRUMENTS.

Also, TAMBOURINES, RANJOS, FIFES, FLUTES, CLARION PICALOGES, VIOLIN BOWS, BOW-HAIR, ROSIN BRIDGES, PEGS, TAIL PIECES, FINGER BOARDS, TUNING FORKS, SSS ROMAN STRINGS (four lengths and four thread), and

ALL KINDS OF MUSICAL INSTRUMENTS.

Fresh every two months from Italy.

All of these goods will be sold to the trade, as they are direct importations from the manufacturers of Europe, and imported in large quantities by A. Kohler. He will sell them much cheaper than any other house in California; therefore it would be the interest of all to call and examine before purchasing elsewhere.

N. B.—Popular Sheet Music by every steamer. Toys and Fancy Goods by the case.

The wholesale department of this House is on Sansome street, occupying the whole block from Clay to Commercial street.

SALES MINING STOCKS.

[Revised and corrected every week.]

The sales of Mining Stocks for the past ten days have been as follows:

Potosi, \$175 per share.
Central, \$625 per share.
Ophir, \$1000 per share.
Gould & Curry, \$225 per share.
Chollar, \$15 per share.
Lucerne, \$20 per foot.
St. Louis, \$4 per foot.
Mount Davidson, \$60 per share.
Mark Anthony, \$8 per foot.
Louise, \$18 per share.
Bradley, \$5 per foot.
Sacramento, \$10.
Shelton Co., \$3 per foot.
Josephine, Flowery, \$10.
West Branch, Flowery, \$7.
Harrison, Flowery, \$12.
Yellow Jacket, \$25.
Exchange, East Comstock, \$40.
Monte Cristo, \$5.
Home Ticket, \$5.
Silver Mound, \$35.
Sunshine, \$16.
Ohio and Buckeye Co. Argentide, \$12.
Chinucy rock, \$15.
Dargen, \$10.
Rich Co., \$3.
Miller, \$12.
Augusta, \$6.
Spanish Co. Plymouth Ledge, \$6.
Chelsea, \$8.
Caney Ledge, \$25.
King Charles, at Flowry, \$6.
Edgar Co. Great Western Ledge, Gelena, \$20.

Number of Shares to the Foot.

Cepral, 12; issue, \$300 per share.
Ophir, 12; issue, \$300 per share.
Gould & Curry, 4; issue, \$500 per share.
Chollar, 4; issue, \$300 per share.
Lucerne, 1; issue, \$500 per share.
Mount Davidson, 4; issue, \$200 per share.

[Having completed all the requisite arrangements, we lay before our readers a reliable list of prices of mining stocks of Utah.]

NOTICE.—THE GENTLEMEN OF SAN FRANCISCO ARE RESPECTFULLY informed that their NEW BILLIARD SALOON, with EIGHT FIRST CLASS PIELAN'S TABLES, will be opened for business on SATURDAY, Jan 29th, 1861. The undersigned respectfully solicits the patronage of all GENTLEMEN Billiard Players, and hope by conducting their Saloon in an unexceptional manner, to merit their continuance and support.

WHEELER & WILSON'S

FAMILY SEWING MACHINES:

NOT ONLY

THE BEST FOR FINE SEWING,

... BUT THE BEST FOR...

MANUFACTURING CLOTHING

... AND...

OTHER HEAVY WORK.

SAN FRANCISCO, June 6, 1861

To H. C. HAYDEN, Agent:

Having in daily use over fifty of Wheeler & Wilson's Family Sewing Machines employed in the binding of Blankets, making Flannel Shirts, Cane and Tweed Suits, etc., from materials made at the Mission Woolen Mills, I certify that they have given perfect satisfaction.

They work with ease, speed and economy. The work done on them is not surpassed.

Various styles of Machines have been employed on the above materials but the Wheeler & Wilson is preferred.

DONALD MCLENNAN,
Proprietor of the Mission Woolen Mills

July 8

SCENTED OILS.—Some of these are sold by perfumers at very high profit; they can all be prepared at a very small expense. Take a quart of common olive oil, and heat it in a stoneware vessel up to two hundred and twelve degrees, then add half an ounce of sal soda, and stir all for fifteen minutes. Allow the oil to cool, and a sediment will fall to the bottom; pour off the clear and scent it with any of the essential oils, such as rosemary, bergamot, and lavender. One fourth of an ounce of essential oil will scent a quart of the prepared oil, which is very excellent for the hair and equal to the celebrated Macassar oil sold at such extravagant prices.

ASTRONOMICAL.—According to the recent experiments of Professor Bunsen, the light of the sun is equal to that of four hundred and seventy one thousand full moons. This is only half of the hitherto received estimate of Wollaston.

CHEAP SALE.—The Bactrian camels were sold the other day in this city at the rate of two hundred dollars apiece. A train of them will soon be engaged in packing between Placerville and Virginia City, across the Sierra Nevada.

IMMENSE.—The issue of the London Times of May 24th, 1855, contained 2575 advertisements. This was considered immense, but a recent number totally eclipsed that. It contained 4000 separate advertisements.

Five yards square (twenty-five square yards), of the finest Decca Masia weigh but one ounce. Decca is a portion of Hindostan.

The highest possible temperature of a fire is 4000 degrees; that of candle, oil and gas flames, about 3000 degrees.

Standish's Combined Reaper and Mower.

Since the appearance of the first reaping and mowing machines, men of mechanical genius have been busily engaged at their improvement, until at last we have a combined reaper and mower invented by an ingenious Californian, which will probably supersede all others at present in use. The inventor is Mr. P. H. Standish, at present residing at San Jose, Santa Clara county. The superior merits of this machine exist in the facts that, 1st—It is capable of doing more work in a given time than any other reaper and mower. 2d—That it does its work in better style. 3d—That it is simpler in construction. 4th—That it is less liable to get out of repair. 5th—That if it does get deranged in any manner, it can easily be repaired, and at trifling cost. 6th—That its price is infinitely less than that of any other machine. For the information of our farming friends we would state that we have secured the sole agency for this State, of this invaluable invention, and shall be happy to see or hear from any of them who desire to purchase county rights, or single machines. Letters must be addressed to "J. Silver-smith, Government House, San Francisco." We warrant the machine to give every satisfaction to purchasers. We are also ready to negotiate with Agricultural Implement makers, for its manufacture. A working model may be seen at the office of the MINING AND SCIENTIFIC PRESS, in San Francisco.

A number of these superior Reapers and Mowers are now in use in this State, and are highly spoken of by their owners. A few of the testimonials we have received are appended:

LAFAYETTE, June 27, 1860.

MR. P. H. STANDISH—Sir: We, the undersigned, did on or about the first of June, see your newly improved Caim Mower work, and, in our judgment, consider it one of the greatest improvements that has ever come under our observation, of the kind, and we cheerfully recommend it to the farming community, as it is purely a California invention, and contains many decided and valuable improvements.

G. W. HAMMITT, A. BALDWIN,
M. CROCKER, CHARLES McCARRON,
D. R. MEACHAM.

June 12th, 1860.

MR. STANDISH—Sir: Your Mower was tried in my cloven meadow yesterday evening; it was rank thick grass and very much lodged. It performed well, as well as any machine could do. I saw it cutting oats in Mr. Harnet's field, and I am pleased with its performance. The cam wheel power over that of the cog wheel for driving a reaper knife must have a decided preference with farmers, on the score of economy, if for no other reason. There are no wear compared to the cog wheel power, which gives out and becomes useless in two years or so. The cam wheel will be as good after twenty years wear. I have no doubt of its being the right principle of driving the reaper knife, and when introduced into use will be preferred to the present cog wheel plan. It saves all the wear and tear of cogging bearings and boxes, and if the plan is carried out and brought into use, it will save thousands of dollars to the farmers in buying reapers every two years.

Yours, with much esteem,

ELAM BROWN.

PACHECO, June 23, 1860.

MR. STANDISH—Sir: This is to certify that I have operated one of your mowing machines, and find it to be, in my opinion, one of the best machines for mowing that I have seen work in this State. I also think that the draft is easier than a cog wheel machine, and also that it will not clog in the knife, or eat any grass.

G. F. BROWN.

Witness: Washington A. Wilson, W. T. Hendrick.

LAFAYETTE, June 27th, 1860.

MR. STANDISH—Sir: I saw your mower at work in down clover and oats very heavy growth; it performed better than any mower I have ever seen, or simplicity, durability and lightness of draft, it certainly has not its equal.

Respectfully, yours,

WARREN BROWN.

PACIFIC FOUNDRY AND MACHINE SHOP, First Street, between Mission and Howard, San Francisco, California.—By recent additions to our before extensive establishment, we can confidently announce to the public that we now have

The Best Foundry and Machine Shop on the Pacific Coast.

With upwards of forty five thousand dollars worth of patterns, we are enabled to do work cheaper and quicker than any other establishment on this side of the Rocky Mountains.

We make to order, and have for sale, High and Low Pressure Engines, both Marine and Stationary; Straight Quartz Mills of all sizes and designs; Stamp-shoes and dies of iron, which is imported by us expressly for this purpose—its peculiar hardness making shoes and dies last two or three months. Milling Pumps of all sizes and kinds; Flouring Mills; Gang, Sash, Malay, and Circular Saw Mills; Shingle Machines, cutting 25,000 per day, and more perfectly than any now in use. Two of these shingle machines can be seen in operation at Vetsch's mill in this city.

Knock's Amalgamator, with the latest improvements; Howland & Hanson's Amalgamator; Goldard's Tub, lately improved; in fact, all kinds now in use.

Quartz Screens, of every degree of fineness, made of the best Russia Iron. Car Wheels and Axles of all dimensions; Building Fronts; Horse Powers; Smit Mills; Boiler Fronts; Wind Mills, of Hunt's, Johnson's and Lum's Patent; and to make a long story short, we make castings and machinery of every description whatever; also, all kinds of Brass Castings.

Thankful to the public for their many past favors, we would respectfully solicit a continuance of their patronage. Before purchasing, give us a call and see what we can do.

GODDARD & CO

ADVANTAGES

—OF—

BRYAN'S IMPROVED MILL.

THIS MILL will Crush, with the same weight of Stamps, Twenty-Five per cent. more rock than any other mill yet invented. It is also Cheaper, more Durable and runs with Less Power. All parts of it being fitted together before leaving the shop, it can be put up and set at work Crushing the Ore, in Ten Hours after arriving on the ground!

Every one exclaims after seeing the Mill in operation, "Why has not so perfect and yet simple a mill been invented before?" It would have Saved the Fortune of many a Minor expended in worthless machinery, and enriched the STATE A THOUSAND FOLD!"

QUARTZ MILL SCREENS

Of all sizes, furnished with dispatch.

ADOPTED AND NOW USED BY

Eastern Slope Gold and Silver Company, } Washoe.
Bartlett Mill Company, }
Ophir Mining Company, }
Union Reduction Company, } San Francisco.
Ogden & Wilson. }

THE VERMONT MOWER

—AND—

COMBINED REAPER AND MOWER,

FOR THE HARVEST OF 1861.

The attention of Farmers is invited to the celebrated Vermont Reaper and Mower, which is unsurpassed for simplicity, Durability, convenience and thoroughness of work.

The high estimation in which this Machine is held by those farmers who have used it, justifies the expectation that, with the late improvements, it will become the leading machine, when its superior qualities are generally known.

SOME POINTS OF EXCELLENCE AND PECULIAR ADVANTAGE WHICH THIS MACHINE HAS OVER OTHERS, ARE AS FOLLOWS:

- 1st. Having the cutter bar hinged to the frame, so as to adjust itself to uneven surfaces.
 - 2d. Having two driving wheels, if one slips the other does the work.
 - 3d. When the machine moves to the right or left, the knives are kept in constant motion by one or the other of the wheels.
 - 4th. It can be oiled, thrown in or out of gear, without the driver leaving his seat.
 - 5th. The whole weight of the machine is on the wheels, where it is needed to give power and strike to the knives.
 - 6th. When the machine is backed, the knives cease to play, consequently you back away from obstructions, without danger of breaking the knives.
 - 7th. The cutter-bar being hinged to the machine, can be packed up with out removing bolt or screw.
 - 8th. The cutter-bar is readily raised by a lever, which is very convenient at the corners of the land; when raised, the machine will turn as short and easily as any two wheeled cart.
 - 9th. It is mostly of iron, simple in construction, and a boy can manage it easily.
 - 10th. It has no side draft.
 - 11th. The combined machine has two sets of cutter bars and sickles, one for mowing, the other designed expressly for reaping, which, with other improvements, should command the attention of every farmer.
- We invite Farmers wishing a machine to call and see before purchasing.
- KNAPP, BURRILL & CO.,
ap10 310 (Old No. 80) Washington street, near Front, San Francisco.

IMPORTANT TO INVENTORS.

ROBERT W. FENWICK,

LAST FOUR YEARS IN CHARGE OF THE WASHINGTON BRANCH OFFICE OF THE SYSTEMATIC American Patent Agency of Messrs. Mann & Co., and for more than ten years officially connected with said firm, and with an experience of fourteen years in every branch relating to the Patent Office, and the interests of inventors.

COUNSELLOR & AGENT IN APPLICATIONS

FOR PATENTS, INTERFERENCES & EXTENSIONS; AND ALSO IN APPEALS TO THE CIRCUIT COURT.

Office, N. E. Cor. 7th and F Sts, 2d Story, Washington, D. C.

[Directly opposite the Patent Office.]

N. B. Specifications and drawings of an invention, with all other business pertaining to the obtaining of Letters Patent, will be executed for a fee of \$25. For arguing the case in the event of a REPEAL, and for appealing it to the Commissioner, no additional fee will be required. In cases of interference or in an Appeal to the Circuit Court a reasonable extra charge will be made.

For a fee of \$5, a preliminary examination will be instituted at the Patent Office, and a reliable opinion given as to the probability of securing a patent. More than four thousand examinations of this character were conducted during the last four years by Mr. Fenwick.

The Government Fee is \$35.

FROM HON. CHARLES MASON, LATE COM. OF PATENTS.

WASHINGTON, D. C., Oct. 4, 1860.

Learning that R. W. Fenwick, Esq., is about to open an office in this city as Solicitor of Patents, I cheerfully state that I have long known him as gentleman of large experience in such matters, of prompt and accurate business habits and of undoubted integrity. As such I commend him to the inventors of the United States.

A JOURNAL OF MINING, AGRICULTURE, MANUFACTURES, SCIENCE, ART, CHEMISTRY, INVENTIONS, ETC.

VOL. III.

SAN FRANCISCO, SATURDAY, AUGUST 24, 1861.

NO 22.

The Big Tree Route.

The *Stockton Independent* says that the Big Tree road was never so much used by freighters as at this season. A gentleman who does business in the town of Murphy's informs us that it is more traveled than all the other roads leading from that place. Yesterday there were twelve large freight wagons passing on the valley of Calaveras towards Washoe, via, Murphy's and the Trees. They were freighted with flour, oats, barley and miscellaneous merchandise. This trade will steadily increase as the population, wealth and business of our transmontane neighbors enlarge. The whole country hence to Salt Lake will draw supplies from this State as soon as the Salt Lake people acquire confidence in the practicability of our road. At all events the whole region on this side the Humboldt mountains must trade with California. The population must be fed, clad and furnished, from the eastern base of the Sierra Nevada to the head of the Humboldt, and south as far as Mono, will number fifty thousand within the present year. They are consumers and non-producers—except of the metals. What they consume is precisely that of which this city and county has an enormous surplus—grain and meats. We can secure this trade directly from Stockton to Washoe if we manage to keep the great thoroughfare open throughout the year. If we fail in this we lose all the advantages of the trade, and forfeit them to Sacramento, Marysville and Placerville.

To illustrate—Stockton is now the *entrepot* of grain products, at the lowest estimate aggregating annually, 1,200,000 bushels; of this, not more than 250,000 bushels is ground in our home mills, the remainder is shipped to San Francisco or to Sacramento. That which goes to San Francisco is either reshipped to the States or Liverpool, or ground into flour which finds its way through the Sacramento river to Placerville, and thence to Washoe. That which we send to Sacramento goes in the grain, and much of it is carried in the same state to Washoe. Thus we contribute from our soil to enlarge the trade of Sacramento, and by inattention to our roads neglect our own advantages. A farmer on the Calaveras, only forty miles from Murphy's, brings his wheat to this city for a market: it is brought here, shipped on the *Eureka* or *Cornelia* for Sacramento, reaches that city after traveling over one hundred and fifty miles, is there put on the cars and carried to Folsom, there put on a large road wagon and carried to Placerville, where it is (after having traveled two hundred and twenty miles by land and water) just as far from its destined market as it would have been at Murphy's; and be it known that the same motive power will carry much more freight over the Murphy's than over the Placerville road. Now, it is very clear that these extra one hundred and eighty miles and three extra re-shippments must be paid for by the final purchaser in Washoe. We are, in fact, every day paying tribute to the enterprise of Sacramento and Placerville. They, with a much inferior road to ours, have by money judiciously expended placed their route in front of all the rest, and led the trade of the State over it. We, by impolicy and inaction, have suffered our unrivaled route to remain untraveled, and until almost very recently almost unknown. The untiring action of the people of Sacramento and Placerville has caused to spring up a continuous line of settlements all along their route, whose very living depends upon keeping it clear of snow, and open during the winter. We need only to imitate them in this respect, and we shall soon have a road of our own which will be just as good in the winter as it is now. If we keep it open but for one season, settlers will come in after that, and we shall have no more trouble about it. It is for the business men of Stockton to say whether they think the matter worth their attention.

ASTOUNDING DISCOVERY.—An interesting paper says the *Philadelphia Bulletin*, relative to the natural dissemination of gold has been read before the American Philosophical Society, in which the statement has been made that the precious metal exists in the clay deposit beneath the city of Philadelphia. This clay covers an area of ten square miles, and lies at an average depth of fifteen feet. The paper says: The inquiry was started whether gold was diffused in this earthy bed. From a central locality, which might afford a fair assay for the whole—the cellar of a market house on Market street, near Eleventh street—some of the clay was obtained at a depth of fourteen feet, where it could not be artificially deposited. The weight of 139 grammes was dried and duly treated, and yielded one eighth of a milligramme of gold—a very decided quantity on a fine assay balance. It was afterwards ascertained that the clay in its natural moisture loses about fifteen per cent. by drying. So that as it lies in the ground, the clay contains one part in 1,224,000. This experiment was repeated upon clay taken from a brick-yard in the suburbs of the city, with nearly the same result. In order to calculate with some accuracy, the value of this body of wealth, the theorists cut out blocks of the clay, and found that, on an average, a cubic foot, as it lies on the ground, weighed one hundred and twenty pounds, and as near as may be, making the specific gravity 1.92. The assay gave seventenths of a grain, say three cents' worth of gold to the cubic foot. If we assume the data already given, we get 4,180 millions of cubic feet of clay under our streets and houses, in which securely lies \$126,000,000. And if, as is pretty certain, the corporate limits of the city would afford eight times this bulk of clay, we have more gold than as yet been brought, according to the statistics, from California or Australia. It is stated that every time a cart-load of clay is hauled out of a cellar, enough gold goes with it to pay for the carting. And if the bricks which form our houses could have brought to their surface, in the form of gold leaf, the amount of gold which they contain, we should have the glittering show of two square inches on every brick. These statements might excite merriment if they were not connected with the names of Mr. Eekfeldt, principal assayer of the mint, and Mr. W. E. DuBois, who read the paper before the Philosophical Society.

Coal Mines of Contra Costa County, by Auguste Remond, Geologist.

For some five or six years it has been known from pretty good indications, that coal deposits exist in the tertiary formations found on this coast from north to south, and even at the foot of the Sierra Nevada. But before this time, had any workable deposits been discovered? The answer must be in the negative. Several times, it is true, mention was made of coal beds formed throughout the Coast Range, but the facts were not truly established. Frequently beds of lignites have been met with, but the quality of the deposits was not good; sometimes the fuel possessed all the qualities required, but it was very far either from roads or streams. Therefore some persons were under the impression that no coal of any kind would ever be found in California; but recently-made discoveries near Mount Diablo, in Contra Costa County, are a proof of the reverse.

There are two different kinds of coal, bituminous coal and lignite; another variety is called anthracite, but it is probably a metamorphic coal. Bituminous coal is the best; it belongs to the upper strata of the primary formations and also to the lower part of the secondary deposits, and above it are found the lignites, which form the passage between peat and bituminous coal. Sometimes they so much resemble this last in composition and external characters, that it is difficult to distinguish the difference. When possessing the required conditions it is very precious, though not so good as true coal, for it can be substituted for it in many cases. Now there is no proof yet of the existence of the coal measures

in this country, but it was a mistake to suppose that no fuel existed in California, for there are the beds of lignites of the tertiary formations represented in the Coast Range on a very large scale.

The coals of Contra Costa County are lignites, and lignites of very good quality, presenting, if I may so speak, the characters of true coal, and being bituminous like it. They form stratified beds, intercalated in the sandstones and other rocks which surround Mount Diablo, and belong to the upper tertiary (Pliocene), as indicated by the fossil shells found in them. These tertiaries are a succession of marine and sweet-water formations, some of them only containing veins of coal, and may be considered as forming two different series, one consisting of heavy beds of white or reddish sandrock with shales and coal veins, and the other of thick strata of sandstones which contain a large number of fossil shells. The relative position of all these beds is shown in the diagram; so the true coal-bearing rocks is the sandrock, composed of minute grains of quartz, in which five coal veins running parallel to each other, alternate in regular order with their associated shales. This sandrock is very compact, and the stratification is sometimes only indicated by lines of ferruginous sand, parallel with each other. Deposits of bituminous limestone of lacustrine origin underlay, and sometimes overlay them. A section through the measures will show that coal and shales are in alternating layers, and the sandrock forms the bed rock upon which rests the coal; a layer of sandy clay shales or slaty soft sandstone covers the coal, and then a thick bed of white sandrock, and upon it another stratum of coal, followed by another layer of shales; again sandrock and coal above with shales, then strata of sandrock and coal again laying upon them, and so forth. The associated shales formed in various alterations with the coal, are usually full of impressions of plants, and that generally in the vicinity of the coal; at the surface they are decayed and perfectly white, but they become reddish brown and turn to black, at some feet from the soil. Layers of black clay are frequently associated with the shales; these are very important for the research of bituminous lignites, especially if they contain black pieces of carbonized plants, because they are indications of the very outcrop of a layer of coal. Yet these slaty rocks are not always accompanied by coal, but this one is never without them. It is to be remarked that the position of the shales is either above or beneath the lignites. So there is nothing to indicate the outcrop of a coal vein but those sandy shales or friable blackish clays with little pieces of carbonized plants. These derive from the decay of the fuel, for the characters alluded to disappear by little and little; at a certain distance from the surface, the rock is seen to become more and more compact, takes a shining black color, and at last presents all the characteristics of mineral coal. The more one goes down the better becomes the fuel.

All the coal-bearing strata, chiefly composed of white sand rock, as we have already seen, are overlaid by thick deposits of sandstone and aluminous clays, associated in some places with a large quantity of nodular gray shales, containing thin layers of concretionary hydraulic limestone and small seams of coal. Some of the sandstones are entirely made up of fossil shells, of remarkable beauty and size, and each layer is characterized by peculiar species of shells, such as *Lutaria*, *Ostrea tinana peten*, 6 inches wide—*Mytilus*, 4 inches wide, and many other new species, very interesting in a scientific point of view, for they will throw a new light on the tertiary formations of California. The principal species are here represented in natural size.*

All the tertiary strata which surround Mount Diablo were primitively formed like horizontal layers, for there is no doubt that these sedimentary strata were, ages ago, the bottom of a tertiary ocean, on the borders of which grew mag-

* The author here and elsewhere alludes to drawings which will appear in a work he is about to present to the public, and of which this paper forms a portion.

nificent forests; their remains, carried on into that basin, were piled up to furnish, at a later time, a large supply of valuable fuels. The coal strata contain exclusively the remains of terrestrial, or fresh water, plants, and some of the beds are occasionally covered with marine shells, hence it may be inferred that the different layers of coal were once submerged in that tertiary sea. But how do they alternate in so regular an order of superposition with that white sand-rock, which is completely devoid of fossils? The deposits seem to have been carried into bays along the coast at remote intervals. Then, under the influence of a climate both warm and damp, a stout vegetation was spreading out.

The bituminous lignites of the vicinity of Mount Diablo, shows us that during the pliocene period (upper tertiary) immense heaps of plants similar to those of our present flora, accumulated beneath the waters very rapidly. So, whole forests must have been drifted away all at once into the tertiary sea; the causes of such catastrophes are to be attributed to great irruptions produced either by either the overflowing of rivers or the sudden breaking up of lakes. These deposits of plants were soon covered up again with thick layers of slates and sands from 300 to 400 feet in thickness; and even more. We may hence infer from the pressure of the sedimentary strata upon the coal beds, that this is one of the acting causes to which is to be attributed the compactness and good quality of the lignites of Contra Costa county.

Such is the probable origin of the formation of these bituminous coals, for tolerably well preserved branches of trees are met with in them. This is the case in the Cumberland and Clark's mines; and it is now generally admitted that every kind of coal is of vegetable origin, that is, is the result of the accumulation of large quantities of drifted wood, which were accumulated ages and ages ago, long before man was created. Another proof in support of this is, that in the hard and soft sandstones overlaying the coal strata, very fine impressions of leaves are found, almost all of them belonging to existing species which still grow in this country; in some places very perfect trunks of silicified trees, several feet in diameter, have preserved their structure in such a manner as not to be distinguishable, at the first glance, from those now lying in the vicinity of coal beds. Some of them are beautifully turned into opal, and would be pretty if cut out and polished. The fibres and vessels of the fossil leaves found in the tertiary sandstone and shales are sometimes as perfectly preserved as in the trees shading the fine sweet-water rivulets which flow from the rocky summits of Mount Diablo. The most perfect leaves I observed were in concretionary nodules of sandstone, from the Corral Hollow formations, in Alameda county; they belonged to the plane tree and yoke-chin, near Kirkus' Pass, a place four miles distant from the San Joaquin river. Willows and poplars have representatives in the fine impressions engraved on a sort of gray sandrock, but so soft that very few specimens can be secured. Herbaceous plants of marshes are seen in aluminous clays, and they probably entered largely into the formation of the bituminous lignites of Contra Costa county.

The tertiary strata and their beds of coal were broken off, lifted up, and consequently sloped as they are to-day, for the upheaval of Mount Diablo raised the coal field around it.—The volcanic force was so violent as to overturn some of the tertiary deposits; for instance, south of Mount Diablo, the strata may be seen standing, perpendicular, with their ledge almost 1800 feet high. So, this mountain penetrated through the sedimentary beds and upheaved the strata on every side, in such a manner that the coal layers present their edges on the side of the sandstone hills facing Mount Diablo. So powerful an upheaval, of course, ought to produce great dislocations or faults in the deposits and divide the lignite beds in enormous fragments, thrown here and there, but yet on a same general line; as is the case with the coal mines now worked on Mount Diablo.

The coal-bearing rocks are therefore lifted up around it so that in the hills north of this mountain, all the strata pitch north with an average dip of 30 degrees, and are consequently exposed one above the other on the southern declivity, and vice versa for the hill's south of the mountain.

The coal mines recently opened are located upon the different beds of mineral fuel, which, from west to east, run nearly on a straight line, broken in several places in consequence of the dislocations they have undergone.—This line commences a little farther up than Clayton, a new village, situated in a most charming and delightful place, at the foot of Mount Diablo, and pursues its course between the mountain and the mouth of the San Joaquin river; as far as 5 or 6 miles distant the working is carried on by means of tunnels or levels run into the hills from north to south, so as to strike coal perpendicularly to the upper surface of the layers. Shafts are usually sunk first, to ascertain the true position of the lignites.

Here are the names of some of the worked mines: The first mine we meet with is that of the Peacock, 4 miles distant from Clayton; it was so called on account of the rainbow colors of its coal, which reproduce those observed in the tail of a peacock. From the indications furnished it is said that the vein is nine feet thick, at a certain depth, and that the coal will be perhaps the best of Contra Costa county; they are now running a near level at the foot of the hills, to strike the heart of the vein and three or four other veins, overlaying it, because at greater depth the mineral fuel will be in much better condition, and it is always the best to reach a coal layer at a level as low as possible. The specimens I

saw were indeed very good; they possessed all the requisite qualities. Above the mine is a spring of sulphur water, as clear as chrysal, but of a very disagreeable scent and bad taste; its water has the singular faculty of giving appetite. Many other sulphur springs are found throughout the tertiary formations. One mile further is located the Cumberland Mine, where forty men are employed daily; this coal vein has a thickness of 2 feet, and the fuel is of good quality. At that place two levels were run for striking the coal in the middle of the bed as much as possible, or at least on a workable portion of its surface. What I have said about the Peacock is to be applied to the coal veins of other mines.

Not far from this point is the Black Diamond Mine, where the vein of fuel is a little more than three feet thick; its quality is pretty good. The Cumberland and Black Diamond Companies have lately cut a road into the whitesand rock and shales, just at the ravine bottom, for the purpose of carrying their coal from the mines.—A fine exposure of strata is seen along that romantic road. These three mines, Peacock, Black Diamond and Cumberland, are situated on the lands belonging to the California Coal Mining Company.—Further on we find the mines of Adam, Crookshank & Co., in Summer's Ravine, where one distinctly sees the outcrops of five different layers of coal. The veins in their lower level is 3 feet in thickness. At last, Clark's Mine is reached; it has a vein four feet and a half thick, overlaid by a stratum of black clay filled with small marine bivalves, the casts of which are sometimes found resting immediately upon the coal bed. These bituminous clays are strongly impregnated with sulphuretted iron, and frequently associated with coal; it is worthy of notice, their gradual passing into coal. They appear at the surface like whitish sandy shales, but soon turn into black clay as they sink beneath the ground; this facies is undoubtedly because bitumen has evaporated.

It is to be expected that sometimes the lignite beds disappear, for the enormous dislocations produced when the tertiary deposits were acted upon by the upheaval of Mount Diablo, occasioned great faults, and consequently interruptions of continuity of coal strata; for there is no coal mine in the world, either from old or new formations, without faults. So, if a layer of fuel is seen to discontinue, or to be mixed together with the associate rocks in such a manner as to render the extraction of fuel impossible, the continuation of that layer must be, perhaps, looked for on the slope of another hill.

Thus, the new coal mines of Contra Costa county are very good, the mineral fuel being equal to several of the imported coals, and placed in convenient conditions for working them. Such a large quantity of coal in this State is a great benefit to California.

The mines are distant from the navigable courses of water by five or six miles only, and coal can be sent either to New York, at the mouth of the San Joaquin river, or to Pacheco-ville, on Nueces Creek, not far from Suisun Bay. The physical configuration of the county permits the construction of roads with great ease. The facilities for the transportation of coal from the mines to San Francisco, and the advantageous position of the beds for economical working, will enable this fuel to be sold at lower prices than any other imported.

This coal is pure and bituminous; it breaks with a bright fracture, lamellar and cleavable on one side, and conchoidal on the other. An analysis of it was made by Mr. Hensch, and presented in his report to the California Coal Mining Company, with the comparison of composition of different English coals from older formations, as Austed gives them in his geology.

We take the following extract from Mr. Hensch's report:

	Carbon.	Bit. vol. Subs.	Ashes.
Mount Diablo coal.	50	46	4
Derbyshire Bituminous coal.	52	45.50	2
Derbyshire Canal coal.	45	47.36	4.64
Clyde Valley coal.	61	45.50	3.13
Lisnabagh Canal coal.	39	50	4
Scotch coal.	48	41	9.50

A glance upon the above table will show the great resemblance in chemical composition and prove that Mount Diablo coal, though belonging to a recent formation, is, in every respect, a true coal that cannot be distinguished from that of older formations. You find it adds no proof more to what experience has already taught long since, that, although the true coal measures are met with only among old formations, the production of a good combustible coal is not strictly confined to such period or such series of strata, but is to be found wherever the local conditions have been favorable to the complete bituminization of beds of vegetable substances. In the example we have, the superior quality of the coals extracted from the beds of Mount Diablo District seems to be attributed, at a certain point, to the volcanic influences acting upon them during the period they were lifted up in their present position by the upheaval of this mountain. Then they seem to have undergone certain changes similar to a sort of cooking process, which must have materially improved their quality and given them the actual character so different from what we now are accustomed to find in the mineral coal belonging to the same geological age.

The coal beds are overlaid by a stratum of sandstone of a variable thickness from 10 to 100 feet; this sandstone, from its peculiarly red color and the stout vegetation growing upon it, is one of the most conspicuous features of the District, assisting the observer to trace the extent of the coal beds from a considerable distance, by the remarkable belt of vegetation which denotes the presence of the sandstone that hides it from view."

We have now to examine an important point, which is, the direction of the coal-bearing strata, and where are they to be looked for? The tertiary strata, having been upheaved, the outcrops of strata must be paid attention to wherever they are exposed, and then such and such system of upheaval carefully studied, to know the direction and the exact position of the analogous deposits. South of Mount Diablo the sedimentary rocks are also tertiary, and present similar characteristics; the dip only is different. So, it is probable that the continuation of the coal vein will be found there, for the sandrock, which, as we have seen, is the chief coal-bearing rock, is represented on a large scale and overlaid by the same fossiliferous sandstones; they are resting there on the very slope of Mount Diablo; they stand perpendicular and run from northwest to southeast, as far as Corral Hollow, in Alameda county, in a direction parallel to the range of hills in which are situated the mines above mentioned. This last one takes its course towards Suisun Bay, and dips beneath it, for when one examines the analogy of the tertiary deposits of Contra Costa county with those of Solano county, one is induced to think that they belong to the same period, forming only a basin at present occupied by the waters of Suisun Bay.

The slaty marks embedded in tertiary deposits contain veins of crystallized gypsum (sulphuretted lime), but not in sufficient quantity to work them; the foliated, radiated, fibrous and arrow head varieties are there represented by fine specimens. In the alluvial clays and sands we find the earthy blue phosphate of iron (vivianite) like small balls, staining the hands as soon as we touch them.

Professor Whitney, State Geologist, in his inaugural address before the Legislature, speaks thus of the coal mines of Contra Costa county.

"The great deposits throughout the world, although not absolutely limited to any one geological formation, are developed on a much larger scale in the rocks of two widely different specks, the paleozoic and the tertiary. It is to the latter class that the coal beds of the Pacific coast belong, as far as yet discovered. Although the tertiary coal-bearing rocks are known to extend all along the coast, from Southern California, as far north at last as Vancouver's Island, no coal beds of any magnitude have been opened and worked within the limits of this State until quite recently. From what hasty examination I have had an opportunity of making, it appears that there is every reason to believe that workable deposits of coal of fair quality and great extent, exists in Contra Costa county, in a very favorable position for mining and shipping to all points in the interior of the State.—The analysis which I had made shows that this coal, of which there are several distinct beds, is well adapted to most of the purposes for which this substance is required. It is a matter of congratulation that the State will soon cease to be dependent upon other regions for her supplies of fuel. The peculiar composition of the California coal fits it admirably for burning in such a climate as exists here; as it may be managed so as to furnish a bright, cheerful flame, or to smoulder quietly away, giving a gentle heat, and keeping on fire for a long time. The amount of ashes it leaves behind is very small, varying from one to five per cent.

"From the geological structure of the State, it would appear probable that many other coal beds will be discovered in the coast ranges, and perhaps in the foot-hills of the Sierra Nevada. Whether any coal of paleozoic age occurs in, the Northern part of the State, as has been supposed, remains to be demonstrated."

Professor William P. Blake, read a very interesting paper before the Academy of Sciences, on the coal mines, and this, a portion of his ideas, I quote from the *Mining and Scientific Press*.

Mr. Blake is of the same opinion as the State Geologist as to the extent and great value of the field. He has explored it, and finds that the veins are thin and run parallel with each other, dipping towards the north at an inclination of twenty-three degrees. The coal is of a most excellent quality, being highly bituminous and nearly free from ashes.—Near the surface it is softer even than the best Hartley, but becomes harder as the excavations descend. Prof. Blake says that the formation is tertiary, the strata being of sandstone, clay, and limestone; and from the marine shells and other fossil remains he found in the coal bearing strata, and from the fact that the particles of sand were very fine and rounded, he conjectured that the immense mass of wood and other vegetable matter deposited in the matrix of the coal, had accumulated at the base of Mount Diablo, and been kept there by an eddy, when the whole of that portion of the country was submerged by water.

There is another theory concerning the origin of coal beds. It is the opinion of some authors that great masses of herbaceous plants were deposited in hollow depressions along sea shores, and impregnated with asphaltum, and that from time to time they were covered by the waters of the sea, which left upon them a large quantity of sand; and so forth for hundreds of years. Mr. Clayton thinks this was the case with the coal mines of Mount Diablo. A few words concerning the geology of this mountain may be of some interest, for from time to time, discoveries of gold silver and copper mines in its rocks are spoken of, when, in fact, nothing is found. The geological constitution of Mount Diablo is as yet little known, and will probably not be before venturesome men have perforated it in every direction, to see whether the heart does not contain their fortunes. Nevertheless, from

the aspect of the rocks, this mountain is of an igneous rather than of a volcanic formation, and presents certain analogy with the Sierra Nevada, for one of its summits is covered with metamorphic slates traversed by small seams of white quartz, schistose rocks, which are undoubtedly nothing but detached from the Sierra Nevada formations. Their altitude above the sea level is nearly the same, and like them are accompanied by serpentine rock.

So far as I could examine the rocks of this mountain, the main mass is compact diorite, with here and there a patch of hard and metamorphic greenstone rocks dipping to the west and similar to those found near Jacksonville, on the Tuolumne river. This formation is traversed by seams of very good looking quartz, and there must be auriferous veins somewhere, as gold or traces of this metal are found in all the streams coming down from the mountain. One thing in support of this, is that lodes of crystallized sulphuret of iron have been discovered in the greenstone and in the metamorphic rocks, affording good indications of the precious metal, because this sulphuret is almost always accompanied by the auriferous quartz. It is said that there are deposits of iron ore in the district, but I saw no indications of it; the red color of the rocks, seen from a distance, corroborates this opinion, but this has been caused by the burning of the bushes, for the rock is greenish or grayish when broken. The presence of silver in the igneous formations of Mount Diablo is very questionable. I was shown one of those famous silver mines; but it was nothing but quartz impregnated with manganese. The dioritic rocks of this singular mountain presents, in some places, an nolic structure, being composed of small rounded grains of hyaline quartz, from the size of a pin's head to that of a pea, cemented by a greenish paste other than the rest, so that the grains stand in relief upon the surface exposed to the weather. The amygdaloidal greenstone is seen passing into a sort of trachyte, the cavities of which are partly filled with minute glassy crystals of a light green color, probably belonging to the pyroxene family. I am under the impression that the upheaval of Mount Diablo was produced, not by the diorites, but by the trachytes underneath, and the reason is because the former rocks are rugged and much broken; they give to that Devil's Mount a frightful appearance. Its apparition is more recent than that of the Sierra Nevada, for it has lifted up the upper tertiary strata and was consequently upheaved after the Pliocene period. The altitude of the mountain is about 3,800 feet.

Greenstones are not the only rocks which go to make up Mount Diablo; there is a large amount of serpentine, thick strata of brown jasper, and some quartziferous porphyries. We see high hills of serpentine forming the base of the mountain, and associated with them many fine dillages. Chromate of iron is found there, but probably not in sufficient quantity to be workable. From the green color and the shining specks of bronzite of these rocks, some people thought it was copper, and of course a copper mine had been discovered, according to them.

If we go up the Bear-Trap Cañada, as far as Divide Ravine, a ravine leading between both peaks, we shall see just above the serpentine, contorted strata of schistose jasper, resting upon the diorites, and extending from that point to the summit of the lower peak, as may be seen in the geological section. They are twisted in every possible manner, and their general direction is from north northeast to south southwest; they have a dip of 45 degrees to the north northwest. The jaspers under consideration are, without doubt, metamorphic beds of clay acted upon and contorted by the greenstones, when they were in a fluid state, and subsequently lifted up by the trachytes; analogous forms are seen in the high hills in the vicinity of the Mission Dolores, San Francisco county. On the other side of the peak are the quartziferous porphyries, which, judging from their being filled with cavities, have been submitted to a very intense heat. The mineralogical character of these quartz rocks is interesting in many respects, for they are the same rocks as those of New Alameda; and cinabar is also found in them in small veins.

From the highest summit of Mount Diablo a fine view is obtained. Far away in the distance stand the snowy peaks of the Sierra Nevada, with their perpetual white cover where, a long time ago, the volcanic fires were rising like burning columns; at the foot of the chain extends the San Joaquin Valley and the river rounding through it; farther north the Sacramento, waving like a silver ribbon. Westward appear the waters of the Pacific, and the Coast Range with its extinct craters.

As we have seen, all the bituminous coals of Contra Costa county are imbedded in tertiary formations, but, what is singular, gryphaea and ammonites were found in them, hence it was believed that secondary strata existed also in the county, and consequently that there might be coal of a quality superior to that of Mount Diablo District. As until now, no geologist, who has explored this part of the State, made any mention of such strata. I examined with great attention all the formations in the county, but my researches were fruitless, and I am satisfied that it is not probable that representations of secondary strata will ever be found in Contra Costa county. The fossils are indeed characteristic shells of secondary rocks, but the discovery of such remains in tertiary strata is very astonishing. Nevertheless, if this is correct, these shells may be derived from a formation older than that in which they are found, as we shall see by and by.

There is in Mount Diablo Valley, on the right side, before reaching the mountain, an extensive deposit of fine limestone, not probably lacustrine origin, which is, perhaps, secondary—but as no fossils have yet been discovered in it, its age cannot be determined with accuracy, and it may prove to be tertiary; if so, perhaps it is to be referred to the calcareous siliceous of the terrain parisien, pliocene period. Mr. Clayton is of the opinion it overlies the coal bearing strata. Four miles southeast of Mount Diablo, I found a similar deposit of compact limestone, full of shells perfectly preserved and belonging perhaps to land or fresh water genera. If this was the case it would be a lacustrine deposit. Those interesting fossils include 3 different species of univalves. Its relative positions could not be ascertained with accuracy, but the remarkable deposit of shelly limestone appears newer than that of Mount Diablo.

Now, in supposing that the secondary period be represented in Contra Costa County beneath the tertiary strata, it is no reason to think there must be coal, for true bituminous coal occupying in secondary formations a position which is almost the same in every country, we may find several strata of that period, without a single indication of coal. As to the lignites, it is not so. This mineral fuel is found in almost every strata, above the older coal measures, and it is much better, as it occupies, in the sedimentary beds, a lower stratum.

Mount Diablo Valley is bounded to the north by a low range of tertiary hills, which rise more and more as it runs toward that mountain. The predominant formation is sandstone impregnated by carbonate of lime and silicate of manganese. In many places it is cut through by dykes of trappan rocks, volcanic products of a dark color and great hardness. These trapps are somewhat cellular at the surface, and very compact inward; the usual color is from gray or dark blue to black, but sometimes in the scoriaceous variety, it is brick red; their stratified structure makes them appear like metamorphic sandstones, but this is only one of the principal characters of this kind of volcanic rock. They are principally composed of white felspar, silica, peroxide of iron, a little magnesia and lime. So, from this composition they are rather trachytes than trapps. The former rocks are found farther to the southeast.

Those volcanic rocks are now on the same line three miles long, the direction of which is from northwest to southeast. We remark they have modified the tertiary strata in cutting through and overflowing over them, and no doubt those trapps have been the principal agents that produced the upheaval of the tertiary strata; we find them everywhere in the Coast Range, and the extraordinary changes of metamorphism observable along the coast, are very often their own work.

In the places where the trapps and other volcanic rocks of the same kind will have cut through the sedimentary formations, there cannot be workable beds of lignites, because there, where the ligneous action has been most intense, coal was partly burnt up, or, at least, shaken and broken to pieces during the apparition of trapp dykes.

If we go to the East these characters disappear little by little, as far as Clayton; and we see good indications of regular coal veins; farther up are located the mines already mentioned. On a careful examination, one notices that the tertiary strata with beds of coal have a peculiar facies, and are exposed always opposite Mount Diablo, standing some times more than 1,000 feet thick. The upheaved beds, the inclination of which varies from 22 to 36 degrees north dip under the plain and run toward Suisun Bay. Indeed, it is evident that the coal-bearing sandrock is surrounded by heavy beds of siliceous sandstone, as is seen in the geological sections, and then by another deposit more recent, consisting of conglomerates, gray sandrock, and the stratified volcanic tuff. Then, the strata above alluded to, underlie them and go down deeper and deeper into the valley, but at this depth they are no more workable, for there are no indications at all for guiding, and afterwards it would be necessary to cross every stratum superior to the coal before striking it; therefore, if an elevated hills, a tunnel some hundred feet long is sufficient to reach the mineral fuel, it will be requisite in the plains, in paying attention to the thickness of the tertiary strata, to go through three or four times as much space, coming to the same result.

Near Kirkus' Pass is a very good place to study the overlying rocks. There, if we ascend the hills to examine that formation, we shall see at first a thick deposit of gray sandrock, containing silicified wood and a few marine shells of the genus calyptra; above it, a fine river conglomerate, and resting upon it a layer of white powdered pumice stone, together with volcanic ashes; at last a thick stratum of red volcanic tuff, made up of minute fragments of pumice cemented by a ferruginous oxide. These stratified deposits disclose submarine eruptions of certain duration, but not intense enough to have produced an upheaval, since the ashes and pumices were deposited horizontally upon the marine formations, these forming aew parallel beds, which could be termed volcanic-sedimentary. Such light eruptions undoubtedly preluded to the great catastrophe, the result of which was the shaking of the tertiary formations.

Eastward, at the foot of the Sierra Nevada, similar rocks have formed extensive deposits; they are the tertiary formations of Knight's Ferry, which consist of sandstones, conglomerate, volcanic tuff, aluminous clays and gravels with fossil wood. Their analogy with those of Kirkus' Pass is so

striking that they are evidently connected with them and belong to the same geological period. Now, from the relative position of those different strata, all of them being certainly upper tertiary, I am inclined to classify them as follows:

Upper tertiary { Lower Pliocene: Sandrock and beds of coal.
Middle Pliocene: Fossiliferous sandstones.
Upper Pliocene: Volcano-sedimentary strata and river deposits.

It is to be remarked that the further we go from Mount Diablo the shorter grow the hills; for after having climbed the summit of this mountain, we see only (some miles distant, and in almost every direction) small rounded hillocks with gentle slopes, which completely vanish at the border of the San Joaquin plain. Some of them are entirely made up of big oysters. The presence of workable beds of coal in those broken hillocks is very questionable, because the formation is too much shaken and divided, and the fuel lays probably at a great depth underneath. Indeed, it is not very difficult to find coal, for there is a detached path of a lignite bed or seam in almost every hill in Contra Costa county, but it must be in sufficient quantity and possess the required conditions to be workable.

In the shales underlying the coal, are sometimes found sharks' teeth, and Professor Whitney has several in his possession. The same shales contain here and there an occasional layer of concretionary iron ore, in the shape of spheroidal bodies, which has been deposited in the clay just like flints in chalk. This ore is very heavy, and effervesces with acids; it seems to be a hydrated carbonate of iron; but it may prove to be nothing but a carbonate of magnesia, impregnated with much iron; its color is from dark yellow to blackish brown.

The white sandrock disappears in the vicinity of Wotkin's Mine (a mine given up), and is seen again at some distance from there. Ton Long Valley is overlaid by a stratified limestone. Nothing interesting in Oak, Lone Tree, Horse Haven and Deer Hollow Valleys. There is a fair exposure of the shales along Marsh's Creek, and we find in this vicinity a very large supply of very good sandstones for making freestone. The rivulet is beautiful in the extreme, and the waters come down from the lofty summits of Mount Diablo, bubbling and murmuring beneath a vault of magnificent plane-trees and poplars. Clear and gentle in summer, it is in winter an impetuous torrent, the violence of which is fully attested by the enormous quartz pebbles that cover its bed.

On the boundary of Contra Costa and Alameda counties are seen heavy beds of gross conglomerate, overlaid by coarse sandstone. This conglomerate is made up of water-worn pebbles of very hard rock (such as felspathic and quartziferous porphyries, that is, of rocks much more ancient than the speck of the formation of that conglomerate; I found it in a bivalve shell of secondary age, but this deposit is tertiary—and it is probable that the ammonites and the gryphaea were discovered in such conditions.

We have made the acquaintance of L. Solomon, Esq., who has just arrived from the Atlantic States; he is the inventor and discoverer of important metallurgical process and machinery. We may perhaps give some of these in detail in our next.

SHAKSPEARE SALOON.

CHAS. DUVEHECK.

Billiards, Fine Liquors and Havana Cigars.

LYCEUM BUILDING,

Cor Montgomery and Washington streets

LEWIS COFFEY & RISDON'S

STEAM BOILER AND SHEET IRON WORKS.

The only exclusively Boiler Making Establishment on the Pacific Coast. Owned and conducted by Practical Boiler Makers. All orders for New Work or the repairing of Old Work, executed as ordered, and warranted as to quality.

Old Stand, corner of Bush and Market Streets,
Opposite Oriental Hotel, San Francisco, Cal.

LEWIS COFFEY,

J. N. RISDON.

A SPLENDID OPPORTUNITY.

AGRICULTURAL MACHINERY.

As I have taken, for five years, a large portion of the State Prison Labor, for the sole purpose of manufacturing AGRICULTURAL IMPLEMENTS AND CABINET WARE

I offer for sale, at a Great Sacrifice, in order to close out my present stock by September First, 1861, the following articles:

TWELVE-HORSE STRAM THRESHERS.
C. M. RUSSELL'S EIGHT AND TEN-HORSE THRESHING MACHINES.
J. A. FITZ'S GENUINE MACHINES, FOUR, SIX, EIGHT, TEN AND TWELVE-HORSE POWER, with all of C. M. Russell's Latest Improvements;
HAY PRESSES, REAPERS AND MOWERS;
EXTRA TRUCKS for Threshing Machines and WIRE TOOTH BUGGY HORSE RAKES.

All of the above goods will be sold at the Lowest Prices, either for Cash, or good approved paper at a low rate of interest.

THOS. OGG SHAW,

33 Sacramento Street.

AGENCY FOR PATENTS.—The undersigned having been long established in the Patent Agency Business, and having favorable arrangements for attending to the interests of inventors at the Patent Office in Washington, offer their services for the securing of Patents and Patents also, will attend to the sales of Patent Rights, and to all matters connected with patented inventions.

WETHERED & TIFFANY,
Office, Market street opposite Montgomery

Mining and Scientific Press.

J. SILVERSMITH, Editor and Proprietor.

SATURDAY.....AUGUST 24, 1861.

The MINING AND SCIENTIFIC PRESS is published at rooms Nos. 20 & 21 Government House, corner of Washington and Sansome sts., by

J. SILVERSMITH, Editor and Proprietor.

At FIFTY CENTS per month, or \$1 per annum, in advance.

Advertisements, Fifty Cents per line.

Engravings, Electrotypes, etc.

WE execute at this Office Engravings and Illustrations on wood, stone, copper, steel, etc. SKETCHING and REPRODUCTION, Designs of every description—Buildings, sketches of Towns, Machinery, Stamp Dies, Seals for Plain or Colored Printing.

JOB WORK—executed with dispatch at the cheapest rates.

PATRONS will remember that when we execute engravings we will insert them free of charge in the MINING AND SCIENTIFIC PRESS, thus giving the advantage of a Wide Circulation throughout the Pacific Coast in the best Advertising Medium to be found in the country.

FOREIGN AND AMERICAN PATENT AGENCY.

The proprietor of this journal respectfully urges those who may possess valuable inventions to consult him respecting their patents or applications. R. W. Fenwick Esq., for more than fourteen years a successful Patent Solicitor, at Washington City, D. C., is our associate, and we guarantee that we can obtain patents in less time, and with less expense, than any other agency in the United States. We employ artists who prepare drawings of models, and engravings in the very best style.

The MINING AND SCIENTIFIC PRESS forms one of the greatest auxiliaries for disseminating inventions and bringing them before the public, both at home and abroad.

What California Needs.

We have frequently alluded through the columns of the MINING AND SCIENTIFIC PRESS, to the necessity existing, for the formation of an Institution which shall diffuse a proper knowledge of the geological structure, mineralogical characteristics, and matters pertaining to both those sciences, of this State. For twelve years our mining community have been, so to speak, groping in the dark. The consequence is that California, although producing a sufficiency of the precious metals to make her the envy of the world, has not half filled the proper measure of her prosperity. Had her miners, instead of working haphazard and blindly, been guided by the light of science and the experience of others, how much further advanced would she be, in her inevitable march to greatness!

Geological, mineralogical and metallurgical studies are ignored by the masses in California, for the alleged reason that they are "dry and uninteresting." Ridiculous, basty and ignorant pre-judgment! To minds capable of reflection, no studies are more pleasingly absorbing; but, to make them so, the student should commence at the bottom of the ladder instead of jumping up in the vain attempt to seize its upper bars.

In several cities and towns of this State, Societies having one or more of these sciences as a specialty, now exist. We wish that every city, town, and village of California, could boast of an association formed for the purpose of obtaining theoretical and practical knowledge of every one of those sciences. This might easily be done, would cost little, and our word for it would accomplish great results. At the weekly or semi-weekly meetings of these societies, geological and mineralogical specimens might be presented, and thus fine local cabinets collected. Specimens could also be exchanged by the various societies, so that ere long each cabinet would represent the whole State. At every meeting too, papers might be read before each society, and thus by a system of alternate tutorage the members would rapidly advance to a considerable elementary knowledge of all these branches of study. When this is done, a great State Central Society could be formed, each local society being represented by one delegate. The headquarters of this State Society might be at Sacramento, Marysville, Stockton or San Francisco. At the Society's offices, an invaluable State Cabinet might be formed by contribution from its local branches. Metallurgical works on a small scale might be connected with such an institute, and new processes could there be tested. Lecturers on each of the three sciences could be appointed, who would travel (with models and other apparatuses if necessary) through the State, visiting every branch society, and instructing it in a higher grade than it had reached. A State College wherein such knowledge

would be taught to the rising generation, from the lowest to the highest grade, might ultimately be founded, and supported as are our public schools, by State taxes. If advisable, branch preparation schools could also be formed.

The great aim of all sciences is to ascertain and systematize the most simple method of accomplishing results. That this object would be greatly assisted by what we have in this article suggested for the consideration of our mining community, is beyond all doubt. Our systems of prospecting, exploitation, working and reducing ores of all kinds, would thus become famous, as are those of Freiberg, Mansfield, and a few other noted places. Indeed, we might excel them. Our country would be vastly benefited, and new regions in our vicinity would be pounced upon, and opened up with mathematical accuracy. Nothing would be missed; for then nearly every miner might on occasion be his own geologist, mineralogist and metallurgist.

Our Mint, its Rules, Charges and Operations.

In the columns of a contemporary we observe some exceedingly interesting statistics of mint matters for many years past, from which we glean the facts that the legal limit of wastage was \$207 766 99 for the three years ending April, 1857, while the actual loss was \$266,312 86, exceeding the limit some sixty thousand dollars. During the four years of Mr. Hempstead's Superintendency, the legal limit was \$235,386 39; while the actual lost was only \$4,520 35 being some \$230,000 less than the limit, and, in fact, a little under two per cent. of the amount allowed by law to be wasted. The wastage of the Philadelphia mint is twenty-two per cent., against two per cent., wasted by our branch mint. The total expenditures for three years under Messrs. Birdsell & Lott, amounted to the large sum of \$1,019,275 39. Under Mr. Hempstead, the total expenditures for four years were but \$1,150,648 14; while the difference between the last year of Judge Lott and the last year of Mr. Hempstead was upward of \$100,000 in favor of the latter. On retiring from the Superintendency, Mr. Hempstead left an unexpended balance of appropriation due the mint of upwards of \$86,000. This certainly is a capital showing for our mint, and speaks well for Mr. Hempstead's Superintendency. Under Mr. Stevens, the present Superintendent, we have no doubt everything will work in an equally satisfactory manner.

We will now present our readers with the rules and charges for work at the mint, knowing how valuable such information must prove to the mining community of the State at large. The charges are as follows:

For parting silver from gold when gold

is below 300—1000ths. fine.....3cts per oz.
" from 300—1000ths. to 750—1000ths fine. 7cts " "
" " 750—1000ths to 950—1000ths " 14cts " "

DEPOSITS SILVER BULLION—PURCHASES.

\$1.21 per standard ounce $\frac{1}{2}$ per ct. on gross value of all gold continued for coinage.

Refining charges (only where gold is contained) proportion of gold 1 to 300, 3cts. per oz. gross weight
301 " 500, 7cts, " " " "

DEPOSITS FOR FINE BARS.

\$1 16—4—11ths cents. per standard ounce, $\frac{1}{2}$ per ct. gross value of silver for making bars; also when gold is contained $\frac{1}{2}$ per ct. on gross value of gold for coining. Refining charges as in purchases.

BARs SOLD FROM REFINERY.

\$1 21cts. per standard oz. $\frac{1}{2}$ per ct. gross value to be added for making bars.

DEPOSITED FOR DOLLARS.

\$1 16—4—11ths. per standard oz. $\frac{1}{2}$ per ct. gross value for coining, when gold is contained, refining charge the same as in purchases.

DEPOSITED FOR IMPORTED BARS.

\$1 16—4—11ths. cents per standard ounce. $\frac{1}{2}$ per ct. gross value of deposit for making bars.

In regard to the deposits of *Washoe silver*, the rule will hereafter be, that the value of gold contained in the same will be paid in gold coin, and the value of silver in silver coin. The value of the silver will be calculated at \$1.21 per standard oz., and is exempted from the coinage charge, unless deposited for silver dollars, in which case a charge of $\frac{1}{2}$ per cent. will be made additional. Bullion of the above denomination will be entered on the gold and silver register, as most congruous with the physical aspects of the material, but in the warrant it must be marked that so much is to be paid in gold and so much in silver, according to the contents reported by the assayer. The above rules, and charges were promulgated on July 10th, by Superintendent Robert J. Stevens.

COMPLIMENTARY.—We acknowledge the receipt of an invitation from O. C. Wheeler Esq., Secretary of the California State Agricultural Society, to be present at the eight annual Fair of that Society, to be held at Sacramento, September 16th and 21st, inclusive. 1861; also of a card, and the assurance of the kind attentions of the Board of Managers: for all of which we return thanks. If alive and well, we shall certainly be there, as without doubt, this, the forthcoming State Fair, will eclipse all its predecessors in every feature.

ELECTRICAL SPIRIT RAPPERS—INTERESTING DEVELOPMENT.

—We have seen a spirit, "and such a spirit." It was none of your airy impalpable spirits, but a substantial spirit, seen with the eyes and handled with the hands. It consisted of a thin wooden box about six inches square, containing an armature and magnet which had been connected with wires to a galvanic battery. When the electric circuit was broken and closed by a button-key the magnet produced a rap in the box, and according to the formula of those who are skilled in the interpretation of spirit language, these raps were read off as a message from the spirit world. A distinguished professor in New York was once a frequent visitor to the establishment where such spiritual manifestations occurred, and the box which we examined had been called the "professor's mother" as he communicated through it so frequently with his beloved and departed parent. Not very long ago a certain house in one of the fashionable streets of New York became distinguished for spiritual visitations. Great numbers of the curious were nightly attracted to its parlor (the fee was one dollar to each visitor) for the purpose of receiving messages from that unseen bourne, from whence, it is said, "no traveler has returned." Many visitors went away quite satisfied, while others were not quite so delighted at having paid their dollars for the ambiguous answers that were given by the spirits. But among all the visitors none were so frequent and satisfied as the professor alluded to. He always paid his dollar cheerfully, and felt comforted with the entertainment. But the delusion came to an end at last. The managers of the establishment had contrived to get into debt, and after due process of law, the Sheriff came one day and exorcised the spirits in a most effectual manner, for the carpets being taken up, about forty spirits were dislodged in the form of little boxes such as we have described. These were placed at certain distances apart, under the boards of the flooring, and some were concealed in the partition walls. The wires of the boxes formed an electric circuit, communicating with a galvanic battery in an upper room. Small buttons formed keys to open and close the circuit; these keys were placed under the carpet in situations well known to the managers. By pressing upon one of these buttons with the foot the electric circuit was closed, in the same manner that a telegraph is operated, and the magnet then made a rap, generally right under the feet of the inquirer, who was always attended by an operator, who generally succeeded in learning something of the previous history of the individual. A clever French electrical mechanic in Broadway furnished these spirits to order. Those who "pulled the wires" in the spirit rapping establishment, however, not only pulled the wool over the professor's eyes, but over the French mechanic's also. He jocularly relates that, although he furnished the spirits, he has never been able to rap his dimes for them out of the crafty fellows who managed to rap so many dollars out of their deluded dupes. We have heard of other modes whereby such rappings have been produced, but none so scientific as this.—*Scientific American*.

AMALGAMATION OF SILVER ORE WITHOUT ROASTING.—Some one writes to the *Call* from Silver City, giving the following process for the amalgamation of silver ore without roasting: Direction: Take Smith's pan, put in fifty pounds of fine pulverized rich silver ore, add sixty pounds of quicksilver, two pounds of caustic potash, half a pound of Sal Ammonia, sufficient water to bring the ore into a thick muddy condition; let it grind five hours, then dilute with more water, draw it off, and you have not only Wakeley's secret, but you get also just as rich tailings, without as much trouble, as Wakeley himself. If you hide your tailings, you may pretend to work within five per cent. as Mr. Wakeley does.

RATES OF OCEAN PASSAGE.—The prices of passage on the steamers of the P. M. S. S. Co., through to New York, are as follows: First cabin, deck room \$258 50, main deck room, \$233 25; second cabin \$180 75; and steerage, \$128 25. To go to New York around Cape Horn in a clipper ship, first cabin, costs about \$150, more or less, according to accommodations, style of living, etc. A cabin passage to China costs from seventy-five to one hundred and twenty-five dollars; to Australia, about the same; and the Sandwich Islands from forty to sixty dollars. A cabin passage to England costs about \$150.

BIG TOMATO.—A man in El Dorado county has raised a tomato this season, measuring seventeen inches, good measure, in circumference.

Yavapai County.—The Transcript says that the machinery of the

Butte County.—A quartz ledge of superior richness has been discovered recently near Lovelock's Mill, in Butte County. Five pounds of rock yielded \$40 50. The discoverers, says the Record, have already pounded with hand mortars some four or five hundred dollars.

NEVADA TERRITORY.

Republican says Yesterday an old trapper, who had been engaged for number of years in the service of the Hudson Bay Company, and who has as but recently left their service, showed us a specimen of copper, "as was a specimen. He found it high up in the mountains, about one hundred miles east from St. James, in the State of Nevada, near the Nevada-Missouri line. The specimen weighed about one pound, and it was a lump of pure virgin copper, in which a dozen lumps of silver as big as small revolver balls, were to be seen. The copper was fixed in a feldspar, as it had somehow been melted into it. The owner said that there was any quantity of such pieces, lying loose around in that country, and that he intended to do his best to make his pile out of them after a while. The specimen was covered with a mass of small holes, and the holes were the work of the Roach beetle. From a correspondent in Lassen's Meadows, who says that he is trading out rock, which has been assayed at Red Bluff at the rate of \$1000 per ton; that he shipped to Red Bluff at the price of eight cents a pound. He says that he has no doubt of the richness of the mines, but that the money is scarce and the market full of flour, bacon and staple groceries. The people here want mining implements, blasting powder and

AUSTRALIA

BRITISH COLUMBIA.

A letter to the Alta, dated Victoria V. I., August 10th, speaks thus of the mines of British Columbia: "The news from the mines continues good, but the subject of extensive mining excitement has taken place since my last. It would, however, appear that the miners upon the Upper Fraser are the same as everywhere else—flushing from good diggings to get better: from certainty to the doubtful one of making a fortune at one swoop. Many miners have already come in overland from the Nez Perces mines; but, on the other hand, some have gone from the southern diggings of the Fraser. There are many camps of men upon the tributaries of the Thompson, who have been there some time, and are constantly increasing, but of whom but little is said: in fact, they manage to keep themselves and their prospects perfectly quiet. The fact is, the gold-bearing country is so vast, that up to the present time, only a very small portion has been examined at all, and with the present comparatively small population, years will elapse before the true richness of the country becomes known. I doubt whether there be more than six thousand miners in British Columbia. Farms and ranches are now springing up on every side, the land being open to those who wish to settle; and those engaged, it is said, make more money by cultivating the soil, than those who turn it over for gold.

HUNT'S IMPROVED FIRST PREMIUM WINDMILLS:

AN ASSORTMENT KEPT CONSTANTLY ON HAND AT THE MANUFACTORY,
Nos. 30 Second street, 208 & 201 Jessie street,
SAN FRANCISCO.

THIS WINDMILL WAS AWARDED THE FIRST PREMIUM AT THE MECHANICS' FAIR OF 1860, in San Francisco, for its great simplicity, strength and durability. It is easily controlled, and will be sold cheaper than any other Mill built. Further particulars in circulars.

The following committee awards the above premium: Devoe, Garratt & Ware; all of this city.
PRICES.—Eight feet wheel, \$50; Ten feet wheel, \$75; Twelve feet wheel \$100 to \$125
ap19 E. O. HUNT, Builder.

UNDERTAKING.—The undersigned would most respectfully inform their friends and the public that they have opened their

COFFIN WAREHOUSES

at 161 Sacramento street, below Kearny, and are ready at all times, night or day, to attend to every call in their line of business. Their stock is very complete, and will enable them to furnish every description of funeral, plain or costly, at the shortest notice.

ALL persons wishing to make interments in Lone Mountain Cemetery, can do so by applying to us at 161 Sacramento street.

ap19

VULCAN IRON WORKS CO.

P. TORQUET, MANAGER.

STEAM ENGINE BUILDERS, BOILER MAKERS, IRON FOUNDERS AND General Engineers, First street, near the Gas Works, San Francisco. Steamboat Machinery built and repaired; also, Saw, Flour and Quartz Mills, Pumping and Mining Machinery, etc.

The Vulcan Iron Works Co. invite the attention of Quartz Miners and others interested to their new style of Portable Dry Crushing Batteries with wrought-iron framing.
fe15

QUARTZ MINERS, ATTENTION!

DR. BEERS would call particular to his Improved
AMALGAMATORS.

For Gold or Silver Ores, which are claimed to possess the following advantages over all others now in use, viz.

1st. They are equally adapted to the amalgamation of Ores either wet or dry crushed.
2nd. Being Self-feeding and Self-discharging, they require but little attention, one man being sufficient to attend thirty or more.
3rd. During the process of amalgamation they reduce the ore to an almost impalpable powder, in close contact with a large surface of mercury, but do not grind the mercury.

4th. It is also claimed for them, and demonstrated, that they will save from 25 to 100 per cent. more gold, than any other Amalgamator now in use.

The Amalgamating Pans are put up in sets of three, discharging into each other: three of which sets are capable of thoroughly amalgamating ten tons of gold ore a day, and with a slight addition, are equally adapted to the amalgamation of Silver Ores, by any of the old or new processes.

The Pans are four feet in diameter, and supplied with a perforated, or grate bottom, upon which the grinding is done, and which allows the gold, as soon as united with the mercury, to settle beneath the grate, and remain as safe as if under lock and key.

In cleaning up the pans and separating the amalgam but about one-tenth the usual labor is required.
The part most exposed to wear are made of hard iron and easily replaced at trifling cost.

All orders for these Amalgamators can be sent to PETER DONAHUE, on First street, San Francisco, at whose Foundry they can also be seen in operation.

For further particulars, inquire of the Patentee,
J. B. BEERS
ma15 165 Clay street,
